

The L^AT_EX 2 _{ε} Sources

Johannes Braams
David Carlisle
Alan Jeffrey
Leslie Lamport
Frank Mittelbach
Chris Rowley
Rainer Schöpf

2025-06-01 Patch level -2

This file is maintained by the L^AT_EX Project team.
Bug reports can be opened (category `latex`) at
<https://latex-project.org/bugs.html>.

Contents

01	ltdirchk.dtx	1
1	L^AT_EX System Dependent Initializations	1
2	Initialization	2
2.1	INITEX	3
2.2	Some bits of 2e	4
3	texsys.cfg	5
3.1	texsys.cfg	5
3.2	UNIX (web2c)	6
3.3	UNIX (other)	7
3.4	MSDOS (emtex)	7
3.5	MSDOS (other)	7
3.6	VMS (DECUS T _E X, PD VMS 3.6)	7
3.7	VMS (???)	7
3.8	MACINTOSH (OzTeX 1.6)	8
3.9	MACINTOSH (other)	8
3.10	FAKE EXAMPLE	8
4	Setting \@currdir	9
5	Setting \input@path	10

6	Filename Parsing	11
7	T_EX Versions	13
8	ltxcheck.tex	13
02	ltplain.dtx	14
1	Plain T_EX	14
03	ltvers.dtx	37
1	Version Identification	37
1.1	Declaring an all-new module	40
04	ltluatex.dtx	42
1	Overview	42
2	Core T_EX functionality	42
3	Plain T_EX interface	43
4	Lua functionality	43
4.1	Allocators in Lua	43
4.2	Lua access to T _E X register numbers	44
4.3	Module utilities	45
4.4	Callback management	45
5	Implementation	46
5.1	Minimum LuaT _E X version	46
5.2	Older L ^A T _E X/Plain T _E X setup	47
5.2.1	Fixes to <i>etex.src/etex.sty</i>	47
5.2.2	luatex specific settings	48
5.3	Attributes	49
5.4	Category code tables	49
5.5	Named Lua functions	51
5.6	Custom whatsis	51
5.7	Lua bytecode registers	52
5.8	Lua chunk registers	52
5.9	Lua loader	52
5.10	Lua module preliminaries	54
5.11	Lua module utilities	54
5.11.1	Module tracking	54
5.11.2	Module messages	55
5.12	Accessing register numbers from Lua	56
5.13	Attribute allocation	57
5.14	Custom whatsit allocation	58

5.15	Bytecode register allocation	58
5.16	Lua chunk name allocation	58
5.17	Lua function allocation	59
5.18	Lua callback management	59
5.18.1	Housekeeping	59
5.18.2	Handlers	64
5.18.3	Public functions for callback management	67
05	ltexpl.dtx	73
1	expl3-dependent code	73
1.1	Loader	73
1.2	Using expl3 code	76
2	Document-level command names for expl3 functions	77
06	ltdefns.dtx	80
1	Definitions	80
1.1	Initex initializations	80
1.2	Saved versions of T _E X primitives	80
1.3	Command definitions	81
1.4	Robust commands and protect	90
1.5	Acting on robust commands	96
1.5.1	Copying robust commands	98
1.5.2	Showing robust commands	100
1.5.3	Commands defined with \DeclareRobustCommand	101
1.5.4	Commands defined with \newcommand (with optional argument)	103
1.5.5	Showing environments	105
1.6	Internal defining commands	106
2	Discretionary Hyphenation	110
07	ltcmd.dtx	113
1	Creating document commands	113
1.1	Variables and constants	113
1.2	Declaring commands and environments	117
1.3	Structure of xparse commands	122
1.4	Normalizing the argument specifications	127
1.5	Preparing the signature: general mechanism	135
1.6	Setting up a standard signature	136
1.7	Setting up expandable types	142
1.7.1	Copying a command and its internal structure	145
1.7.2	Showing the definition of a command	151
1.8	Grabbing arguments	156
1.9	Grabbing arguments expandably	174
1.10	Argument processors	179

1.11	Conversion to key–value form	181
1.12	Utilities	184
1.13	Messages	188
1.14	User functions	193
08	lthooks.dtx	199
1	Introduction	199
2	Package writer interface	199
2.1	$\text{\LaTeX} 2\epsilon$ interfaces	199
2.1.1	Declaring hooks	199
2.1.2	Special declarations for generic hooks	200
2.1.3	Using hooks in code	201
2.1.4	Updating code for hooks	202
2.1.5	Hook names and default labels	205
2.1.6	The <code>top-level</code> label	207
2.1.7	Defining relations between hook code	207
2.1.8	Querying hooks	209
2.1.9	Displaying hook code	210
2.1.10	Debugging hook code	211
2.2	L3 programming layer (<code>exp13</code>) interfaces	211
2.3	On the order of hook code execution	214
2.4	The use of “reversed” hooks	216
2.5	Difference between “normal” and “one-time” hooks	217
2.6	Generic hooks provided by packages	217
2.7	Hooks with arguments	218
2.8	Private \LaTeX kernel hooks	220
2.9	Legacy $\text{\LaTeX} 2\epsilon$ interfaces	220
3	$\text{\LaTeX} 2\epsilon$ commands and environments augmented by hooks	221
3.1	Generic hooks	221
3.1.1	Generic hooks for all environments	222
3.1.2	Generic hooks for commands	223
3.1.3	Generic hooks provided by file loading operations	223
3.2	Hooks provided by <code>\begin{document}</code>	224
3.3	Hooks provided by <code>\end{document}</code>	224
3.4	Hooks provided by <code>\shipout</code> operations	226
3.5	Hooks provided for paragraphs	226
3.6	Hooks provided in NFSS commands	226
3.7	Hook provided by the mark mechanism	227

4	The Implementation	227
4.1	Debugging	227
4.2	Borrowing from internals of other kernel modules	228
4.3	Declarations	228
4.4	Providing new hooks	230
4.4.1	The data structures of a hook	230
4.4.2	On the existence of hooks	231
4.4.3	Setting hooks up	232
4.4.4	Disabling and providing hooks	238
4.5	Parsing a label	240
4.6	Adding or removing hook code	244
4.7	Setting rules for hooks code	265
4.8	Specifying code for next invocation	286
4.9	Using the hook	289
4.10	Querying a hook	294
4.11	Messages	298
4.12	L ^T E _X 2 _E package interface commands	301
4.13	Deprecated that needs cleanup at some point	305
4.14	Internal commands needed elsewhere	306
09	ltcmdhooks.dtx	309
1	Introduction	309
2	Restrictions and Operational details	310
2.1	Patching	311
2.1.1	Timing	311
2.2	Commands that look ahead	311
3	Package Author Interface	312
3.1	Arguments and redefining commands	313
4	The Implementation	313
4.1	Execution plan	313
4.2	Variables	314
4.3	Variants	315
4.4	Patching or delaying	315
4.5	Patching commands	317
4.5.1	Patching by expansion and redefinition	318
4.5.2	Patching by retokenization	326
4.6	Messages	333
10	ltsockets.dtx	335
1	Introduction	335

2 Configuration of the transformation process	335
2.1 The template mechanism	335
2.2 The hook mechanism	336
2.3 The socket mechanism	336
2.3.1 Examples	338
2.3.2 Details and semantics	339
2.3.3 Command syntax	341
2.3.4 Rationale for error handling	343
3 The Implementation	343
3.1 Debugging the socket structures	343
3.2 The L3 layer commands	344
3.3 Error messages	348
3.4 The $\text{\LaTeX} 2\epsilon$ interface commands	348
11 lttemplates.dtx	350
1 Introduction	350
2 What is a document?	350
3 Types, templates, and instances	351
4 Template types	351
5 Templates	351
6 Multiple choices	355
7 Instances	356
8 Document interface	357
9 Changing existing definitions	358
10 Getting information about templates and instances	358
11 The implementation	359
11.1 Variables and constants	360
11.2 Testing existence and validity	362
11.3 Saving and recovering property lists	363
11.4 Creating new template types	365
11.5 Design part of template declaration	366
11.5.1 Storing values	369
11.6 Implementation part of template declaration	370
11.7 Editing template defaults	375
11.8 Creating instances of templates	377
11.9 Using templates directly	379
11.10 Assigning values to variables	380
11.11 Using instances	383
11.12 Assignment manipulation	384

11.13	Showing templates and instances	384
11.14	Messages	385
11.15	User functions	389
12	ltalloc.dtx	391
1	Counters	391
13	ltcntrl.dtx	393
1	Program control structure	393
14	lterror.dtx	397
1	Error handling and tracing	397
1.1	General commands	397
1.2	Specific errors	403
1.3	Tracing	407
15	ltpar.dtx	408
1	Paragraphs	408
1.1	Implementation	408
16	ltpara.dtx	410
1	Introduction	410
1.1	The default processing done by the engine	410
2	The new mechanism implemented for L ^A T _E X	412
2.1	The provided hooks	413
2.2	Altered and newly provided commands	414
2.3	Examples	415
2.3.1	Testing the mechanism	415
2.3.2	Mark the first paragraph of each <code>itemize</code>	417
2.4	Some technical notes	417
2.4.1	Glue items between paragraphs (found with <code>fancypar</code>)	417
3	The Implementation	418
3.1	Providing hooks for paragraphs	418
3.2	The error messages	425
17	ltmeta.dtx	427
1	Introduction	427
1.1	\DocumentMetadata	427

2	The Implementation	427
18	ltspace.dtx	430
1	Spacing	430
1.1	User Commands	430
1.2	Chris' comments	430
1.3	Some immediate actions	432
1.4	The code	433
1.5	Vertical spacing	440
1.6	Horizontal space (and breaks)	446
19	ltlogos.dtx	450
1	Logos	450
20	ltfiles.dtx	451
1	File Handling	451
1.1	Safe Input Macros	464
1.2	Listing files	472
21	ltoutenc.dtx	475
1	Font encodings	475
1.1	Removing encoding-specific commands	477
1.2	The order of declarations	478
1.3	Docstrip modules	478
1.4	Definitions for the kernel	479
1.4.1	Declaration commands	479
1.4.2	Hyphenation	487
1.4.3	Miscellania	488
1.4.4	Default encodings	488
1.4.5	Math material	490
1.5	Definitions for the OT1 encoding	491
1.6	Definitions for the T1 encoding	494
1.7	Definitions for the OMS encoding	499
1.8	Definitions for the OML encoding	500
1.9	Definitions for the OT4 encoding	500
1.10	Definitions for the TS1 encoding	502
1.11	Definitions for the TU encoding	507
2	Package files	518
2.1	The fontenc package	518
22	ltcounts.dtx	521

1	Counters and Lengths	521
1.1	Environment Counter Macros	521
23	ltlength.dtx	531
1	Lengths	531
24	ltfssbas.dtx	533
1	Preliminary macros	533
2	Macros for setting up the tables	534
3	Selecting a new font	543
3.1	Macros for the user	543
3.2	Macros for loading fonts	549
4	Assigning math fonts to <i>versions</i>	556
25	ltfssaxes.dtx	563
1	Changing the font series	563
1.1	The series lookup table	563
1.2	Mapping rules for series changes	564
1.3	Changing to a new series	617
2	Changing the shape	622
2.1	Mapping rules for shape combinations	624
2.2	Changing to a new shape	628
3	Make sure we win	630
26	ltfsstrc.dtx	633
1	Introduction	633
2	A driver for this document	633
3	The Implementation	634
4	Handling Options	634
5	Macros common to <code>fam.tex</code> and <code>tracefnt.sty</code>	636
5.1	General font loading	636
5.2	Math fonts setup	642
5.2.1	Outline of algorithm for math font sizes	642
5.2.2	Code for math font size setting	643
5.2.3	Other code for math	644

6	Scaled font extraction	646
6.1	Sizefunctions	654

28	ltfssdcl.dtx	663
1	Interface Commands	663
29	ltfssini.dtx	695
1	NFSS Initialization	695
1.1	Providing math <i>versions</i>	695
2	Custom series settings for main document families	696
3	Supporting nested emphasis	713
3.1	Legacy	717
3.2	Miscellaneous	717
30	fontdef.dtx	723
1	Introduction	723
2	Customization	723
3	The <code>docstrip</code> modules	724
4	A driver for this document	724
5	The <code>fonttext.ltx</code> file	724
5.1	Encodings	725
5.2	Defaults	727
6	The <code>fontmath.ltx</code> file	729
6.1	The font encodings used	729
6.1.1	Symbolfont and Alphabet declarations	730
6.2	Math font sizes	730
6.3	The math symbol assignments	731
6.3.1	The letters	731
6.3.2	The digits	732
6.3.3	Punctuation, brace, etc. keys	732
6.3.4	Delimitercodes for characters	733
6.4	Symbols accessed via control sequences	733
6.4.1	Greek letters	733
6.4.2	Ordinary symbols	734
6.4.3	Large Operators	735
6.4.4	Binary symbols	735

6.4.5	Relations	736
6.4.6	Arrows	738
6.4.7	Punctuation symbols	738
6.4.8	Math accents	739
6.4.9	Radicals	739
6.4.10	Over and under something, etc	739
6.4.11	Delimiters	740
6.5	Math versions of text commands	741
6.6	Other special functions and parameters	742
6.6.1	Biggggg	742
6.6.2	The log-like functions	742
6.6.3	Parameters	742
7	Default cfg files	742
31	preload.dtx	744
1	Overview	744
2	Customization	744
3	Module switches for the <code>DOCSTRIP</code> program	744
4	A driver for this document	745
5	The code	745
32	ltfntcmd.dtx	747
1	Introduction	747
2	The implementation	749
3	Initialization	755
33	lttextcomp.dtx	756
1	Sub-encodings	758
1.1	Unavailable in sub-encoding 1 and higher (drop symbols not working in Latin Modern)	760
1.2	Unavailable in sub-encoding 2 (majority of new OTF fonts via autoinst) and higher	760
1.3	Unavailable in sub-encoding 3 and higher	763
1.4	Unavailable in sub-encoding 4 and higher	763
1.5	Unavailable in sub-encoding 5 (most older PS fonts) and higher	764
1.6	Unavailable in sub-encoding 6 and higher	764
1.7	Unavailable in sub-encoding 7 and higher	764
1.8	Unavailable in sub-encoding 8 and higher	764
1.9	Unavailable in Sub-encoding 9 (most missing)	765

2	Unicode engine specials	765
3	Font family sub-encodings setup	766
4	Legacy symbol support for lists and footnote symbols	770
5	The <code>textcomp</code> package	775
5.1	The old <code>textcomp</code> package code	776
5.1.1	Supporting oldstyle digits	785
5.1.2	Subset encoding defaults	785
6	The <code>checkencodingsubset.tex</code> file	787
34	<code>ltpageno.dtx</code>	796
1	Page Numbering	796
35	<code>ltxref.dtx</code>	797
1	Cross Referencing	797
1.1	Cross Referencing	797
36	<code>ltproperties.dtx</code>	805
1	Introduction	805
2	Design discussion	805
3	Handling unknown labels and properties	806
4	Rerun messages	806
5	Open points	806
6	Code interfaces	806
7	Auxiliary file interfaces	808
8	$\text{\LaTeX} 2\epsilon$ interface	808
9	Pre-declared properties	809
10	The Implementation	810
10.1	Reference commands	812
10.2	Tests and warnings	814
10.3	Predeclared properties	816
10.4	Messages	818
37	<code>ltmisen.dtx</code>	819

1	Miscellaneous Environments	819
1.1	Environments	819
1.2	Center, Flushright, Flushleft	833
1.3	Verbatim	836
38	ltmath.dtx	844
1	Math setup	844
1.1	Math commands based on plain TeX	844

48	ltmarks.dtx	1003
1	Introduction	1003
2	Design-level and code-level interfaces	1004
2.1	Use cases for conditionals	1006
2.2	Understanding regions	1006
2.3	Debugging mark code	1008
3	Application examples	1008
4	Legacy L^AT_EX 2_E interface	1008
4.1	Legacy design-level and document-level interfaces	1009
4.2	Legacy interface extensions	1009
5	Notes on the mechanism	1010
6	Public interfaces for packages such as <code>multicol</code>	1011
7	Internal functions for the standard output routine of L^AT_EX	1012

8	The Implementation	1013
8.1	Allocating new mark classes	1013
8.2	Updating mark structures	1015
8.3	Placing and retrieving marks	1023
8.4	Comparing mark values	1025
8.5	Messages	1025
8.6	Debugging the mark structures	1026
8.7	Designer-level interfaces	1028
9	L^AT_EX 2_≤ integration	1029
9.1	Core L ^A T _E X 2 _≤ integration	1029
9.2	Other L ^A T _E X 2 _≤ output routines	1032
9.3	Rollback information	1032
49	ltpage.dtx	1033
1	Page styles and related commands	1033
1.1	Page Style Commands	1033
1.2	How a page style makes running heads and feet	1033
1.3	marking conventions	1033
50	ltclass.dtx	1038
1	Introduction	1038
2	User interface	1038
2.1	Option processing	1039
3	Class and Package interface	1040
3.1	Class name and version	1040
3.2	Package name and version	1040
3.3	Requiring other packages	1040
3.4	Declaring new options	1041
3.5	Safe Input Macros	1042
4	Implementation	1042
4.1	Hooks	1071
4.2	Providing shipment	1074
5	Package/class rollback mechanism	1082
6	After Preamble	1090
51	ltkeys.dtx	1091

1	Creating and using keyval options	1091
1.1	Implementation of <code>\lkeys</code>	1092
1.2	Key properties	1092
1.3	Main mechanism	1093
1.4	The document interfaces	1097
1.5	Option usage scope	1098
1.6	General key setting	1099
52	<code>ltfilehook.dtx</code>	1100
1	Introduction	1100
1.1	Provided hooks	1100
1.2	General hooks for file reading	1100
1.3	Hooks for package and class files	1101
1.4	Hooks for <code>\include</code> files	1102
1.5	High-level interfaces for L ^A T _E X	1103
1.6	Kernel, class, and package interfaces for L ^A T _E X	1104
1.7	A sample package for structuring the log output	1104
2	The Implementation	1105
2.1	Document and package-level commands	1105
2.2	<code>expl3</code> helpers	1106
2.3	Declaring the file-related hooks	1109
2.4	Patching L ^A T _E X's <code>\InputIfFileExists</code> command	1109
2.5	Declaring a file substitution	1111
2.6	Selecting a file (<code>\set@curr@file</code>)	1113
2.7	Replacing a file and detecting loops	1116
2.7.1	The Tortoise and Hare algorithm	1117
2.8	Preventing a package from loading	1119

File 01

ltdirchk.dtx

1 L^AT_EX System Dependent Initializations

This file implements the semi-automatic determination of various system dependent parts of the initialization. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}{space}` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `{space}`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `{dir}` is an entry in the input path, TeX will try to load the expansion of `{dir}{filename}{space}`

So either `{dir}` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `{filename}`. This means that for UNIX-like syntax, each `{dir}` should end with a slash, /.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse` After a call of the form: `\filename@parse{filename}`, the three macros `\filename@area`, `\filename@base` and `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `filename`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TeX versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` `\@TeXversion` is now set automatically by the initialization tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation is left for information. L^AT_EX does not set this variable exactly, the automatic tests set it to:
2 for any version, v , $v < 3.0$
3 for any version, v , $3.0 \leq v \leq 3.14$

`<undefined>` otherwise.

However these values are accurate enough for L^AT_EX to take appropriate action for these old T_EXs.

If your T_EX is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this¹, L^AT_EX will not work around a bug in old T_EX versions, and so error messages will appear in a very strange format, with `^^J` appearing instead of line breaks:

```
LaTeX Error: \rubbish undefined.^^J^^JSee the LaTeX manual or LaTeX=
Companion
for explanation.^^JType H <return> for immediate help.
...
.3 \renewcommand{\rubbish}
{}
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
LaTeX Error: \rubbish undefined.

See the LaTeX manual or LaTeX Companion for explanation.
Type H <return> for immediate help.
.
...
.3 \renewcommand{\rubbish}
{}
```

Note that this has an extra line `! .` which does not appear in error messages that use the default settings with a current version of T_EX, but this should not cause any confusion we hope.

2 Initialization

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

Most such definitions are repeated later in the “right” place, usually (but not always) with different implementations. To be able to spot this more easily if you look into the file `latex.ltx` (which is stripped of comments) we add some comment lines to that effect that survive the stripping process by `docstrip`.

```
1 <*dircheck>
2 %% ---- START temporary definitions for bootstrapping; later overwritten ----
3 </dircheck>
```

¹Actually if your T_EX is really old, version 2, L^AT_EX can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

2.1 INITEX

```

4  {*dircheck}
5  {*initex}
6  <initex> \ifnum\catcode`\'f=1
7  <initex>   \errmessage
8  <initex>   {LaTeX must be made using an initex with no format preloaded}
9  <initex> \fi
10 \catcode`\'f=1
11 \catcode`\'j=2

```

If **LuaTeX** is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of **LuaTeX** do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```

12 \ifx\directlua\undefined
13 \else
14   \ifx\luatexversion\undefined

```

Enable e-TeX/pdfTeX/Umath primitives with their natural names

```

15   \directlua{tex.enableprimitives("",%
16               tex.extraprimitives('etex', 'pdftex', 'umath'))}

```

In current formats enable primitives with unprefixed names. the **latexrelease** guards allow the primitives to be defined with a **\luatex** prefix if older formats are specified.

The unprefixed forms are *not* undefined for improved compatibility with external packages when rolling back the format.

```

17 </initex>
18 </dircheck>
19 <*initex, latexrelease>
20 <latexrelease> \ifx\directlua\undefined\else
21 <latexrelease> \IncludeInRelease{2015/10/01}{\luatexluafunction}
22 <latexrelease>                               {LuaTeX (prefixed names)}%
23   \directlua{tex.enableprimitives("",%
24               tex.extraprimitives("omega", "aleph", "luatex"))}
25 <latexrelease> \EndIncludeInRelease
26 <latexrelease> \IncludeInRelease{0000/00/00}{\luatexluafunction}
27 <latexrelease>                               {LuaTeX (prefixed names)}%
28 <latexrelease> \directlua{
29 <latexrelease>   tex.enableprimitives(
30 <latexrelease>     "luatex",
31 <latexrelease>     tex.extraprimitives("core", "omega", "aleph", "luatex")
32 <latexrelease>   )
33 <latexrelease> }
34 <latexrelease> \EndIncludeInRelease
35 <latexrelease> \fi
36 </initex, latexrelease>
37 <*dircheck>
38 <*initex>
39   \fi
40 \fi

```

A test can now be made for eTeX.

```

41 <initex> \ifx\etexversion\undefined
42 <initex>   \errmessage
43 <initex>   {LaTeX requires e-TeX}
44 <initex>   \expandafter\endinput

```

```

45  <initex>\fi

```

3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between START and END is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

```

97 {*docstrip}
98 \openin15=texsys.cfg
99 \ifeof15
100 \typeout{** Writing a default texsys.cfg}

```

3.1 texsys.cfg

This file contains the site specific definitions of the four macros `\@currdir`, `\input@path`, `\filename@parse` and `\@TeXversion`.

As distributed it only contains comments, however this ‘empty’ file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You are allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir` `\@currdir<filename><space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `<space>`. If

the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `\langle dir \rangle` is an entry in the input path, TeX will try to load the expansion of `\langle dir \rangle\langle filename \rangle\langle space \rangle`

So either `\langle dir \rangle` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `\langle filename \rangle`. This means that for UNIX-like syntax, each `\langle dir \rangle` should end with a slash, `/`. One exception to this rule is that the input path should *always* contain the empty directory `{}` as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a `\{ \} group`.

`\filename@parse` After a call of the form: `\filename@parse{\langle filename \rangle}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `\langle filename \rangle`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TeX versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` You should not need to set this macro in `texsys.cfg`. L^AT_EX tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

114 `%\def\@currdir{./}`
115 `%\let\input@path\@undefined`

3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
116 % \def\@currdir{./}
117 % \def\input@path{%
118 %   {/usr/local/lib/tex/inputs/distrib/}%
119 %   {/usr/local/lib/tex/inputs/contrib/}%
120 %   {/usr/local/lib/tex/inputs/local/}%
121 % }
```

3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
122 % \def\@currdir{./}
123 % \let\input@path\@undefined
```

3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
124 % \def\@currdir{./}
125 % \def\input@path{%
126 %   {c:/tex/inputs/distrib/}%
127 %   {c:/tex/inputs/contrib/}%
128 %   {c:/tex/inputs/local/}%
129 % }
```

3.6 VMS (DECUS TEX, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
130 % \def\@currdir{[]}
131 % \let\input@path\@undefined
```

3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
132 % \def\@currdir{[]}
133 % \def\input@path{%
134 %   {tex_inputs:}%
135 %   {SOMEDISK:[SOME.TEX.DIRECTORY]}%
136 % }
```

3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
137 % \def\@currdir{:  
138 % \let\input@path\@undefined
```

3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with :, and they should contain *no* spaces.

```
139 % \def\@currdir{:  
140 % \def\input@path{  
141 %   {Hard-Disk:Applications:TeX:TeX-inputs:  
142 %   {Hard-Disk:Applications:TeX:My-inputs:  
143 % }
```

3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form <area>name. For maximum compatibility with macro sets, you want `name.ext` to be mapped to <ext>name, and <area>name.ext to be mapped to <area.ext>name. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. <>name is the desired ‘current directory’ syntax.

the following code would possibly work:

```
144 % \def\@dir#1#2 {  
145 %   \@d@r{#1}#2..\@nil}  
146 % \def\@d@r#1#2.#3.#4\@nil{  
147 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 }  
148 %  
149 % \def\@currdir{\@dir{}}  
150 % \def\input@path{  
151 %   {\@dir{area.one}}%  
152 %   {\@dir{area.two}}%  
153 % }
```

END

```
154 \immediate\closeout15
```

If `texsys.cfg` did exist, then input it.

```
155 \else  
156 \typeout{** Using the existing texsys.cfg}  
157 \closein15  
158 \input texsys.cfg  
159 \fi  
160 </docstrip>
```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```
161 <dircheck>\input texsys.cfg
```

4 Setting \@currdir

\@currdir
\IfFileExists This is a local definition of \IfFileExists. It tries to relocate `texssys.aux`. If it succeeds, then the \@currdir syntax has been determined. If all the tests fail then \@currdir will be set to \@empty, and `ltxcheck` will warn of this when it checks the format.

```
162 \begingroup
163 \count@\time
164 \divide\count@ 60
165 \count2=-\count@
166 \multiply\count2 60
167 \advance\count2 \time
```

The current date and time stamp.

```
168 \edef\today{%
169   \the\year/\two@digits{\the\month}/\two@digits{\the\day}:
170   \two@digits{\the\count@}:\two@digits{\the\count2}}
```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```
171 \immediate\openout15=texsys.aux
172 \immediate\write15{\today^J}
173 \immediate\closeout15 %
```

#1 is the file to try, #2 is what to do on success, #3 on failure. Note that this definition is overwritten later on again!

```
174 \def\IfFileExists#1#2#3{%
175   \openin\@inputcheck#1 %
176   \ifeof\@inputcheck
177     #3\relax
178   \else

Stop here if the file is being used unstripped.

```

214 <*docstrip>
215 \relax\endinput
216 </docstrip>

```

5 Setting `\input@path`

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found to be very reliable. The first-time installer of L^AT_EX 2_E can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through L^AT_EX 2_E. This will check, among other things, whether `texsys.cfg` will need to be edited and the format remade.

`\input@path` Now set up the `\input@path`.

`\input@path` should either be undefined, or a list of directories as described in the introduction.

```

217 \typeout{^^J%

```

```

218     Assuming \noexpand\openin and \noexpand\input^^J%
219     \ifx\input@path\@undefined

7 T_EX Versions

`\@TeXversion` T_EX versions older than 3.141 require `\@TeXversion` to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. Actually this will not always get the correct version number, e.g., T_EX3.14 would be detected as T_EX3, but L^AT_EX only needs to take account of T_EX's older than 3, or between 3 and 3.14.

```

310 \ifx\@TeXversion\undefined

319 \fi

(End of definition for \@TeXversion.)

320 %% ---- END temporary definitions for bootstrapping ----
321 </dircheck>

```

8 ltxcheck.tex

After the format has been made, and `article.cls` moved with the other files to the ‘standard input directory’ as specified in `install.txt`, the format may be checked by running the file `ltxcheck.tex`.

File 02

ltplain.dtx

1 Plain T_EX

L^AT_EX includes almost all of the functionality of Knuth's original 'Basic Macros'. That is, the plain T_EX format described in Appendix B of the T_EXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep     \magstephalf  
\mathhexbox  
\vglue      \vgl@  
\hglue      \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L^AT_EX font definitions are done using NFSS2 so none of PLAIN's font definitions are in L^AT_EX.

L^AT_EX has its own tabbing environment, so PLAIN's is disabled.

L^AT_EX uses its own output routine, so most of the plain one was removed.

```
1  {*2ekernel}  
2  \catcode`{\=1 % left brace is begin-group character  
3  \catcode`}=\=2 % right brace is end-group character  
4  \catcode`$=\=3 % dollar sign is math shift  
5  \catcode`&=\=4 % ampersand is alignment tab  
6  \catcode`#=\=6 % hash mark is macro parameter character  
7  \catcode`^=\=7 % circumflex and uparrow are for superscripts  
8  \catcode`_=\=8 % underline and downarrow are for subscripts  
9  \catcode`^^I=\=10 % ascii tab is a blank space  
10 \chardef\active=13 \catcode`~=\active % tilde is active  
11 \catcode`^^L=\active \def`~L{\par}% ascii form-feed is \par  
12 \message{catcodes,}
```

We had to define the `\catcodes` right away, before the message line, since `\message` uses the { and } characters. When INITEX (the T_EX initializer) starts up, it has defined the following `\catcode` values:

```
\catcode`^^@=\=9 % ascii null is ignored  
\catcode`^^M=\=5 % ascii return is end-line  
\catcode`\\=\=0 % backslash is TeX escape character  
\catcode`%=\=14 % percent sign is comment character  
\catcode` =\=10 % ascii space is blank space  
\catcode`^^?=\=15 % ascii delete is invalid  
\catcode`A=\=11 ... \catcode`Z=\=11 % uppercase letters  
\catcode`a=\=11 ... \catcode`z=\=11 % lowercase letters  
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do` ` \do`\\ \do`{\ \do`}\ \do`\$\ \do`\&%  
14   \do`\#\ \do`\^ \do`\_ \do`\%\ \do`\~ \do`\^^I}
```

(not counting ascii null, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

15 \catcode`@=11

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

\@ne Small constants are defined using \chardef.

\tw@ 16 \chardef\@ne=1

\thr@@ 17 \chardef\tw@=2

\sixt@@n 18 \chardef\thr@@=3

\@cclv 19 \chardef\sixt@@n=16

20 \chardef\@cclv=255

(End of definition for \@ne and others.)

\@cclvi Constants above 255 defined using \mathchardef.

\@m 21 \mathchardef\@cclvi=256

\@M 22 \mathchardef\@m=1000

\@MM 23 \mathchardef\@M=10000

24 \mathchardef\@MM=20000

(End of definition for \@cclvi and others.)

Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

25 \message{registers,}

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

The following counters are reserved:

0 to 9 page numbering

10 count allocation

11 dimen allocation

12 skip allocation

13 muskip allocation

14 box allocation

15 toks allocation

16 read file allocation

17 write file allocation

18 math family allocation

19 language allocation

20 insert allocation

21 the most recently allocated number

22 constant -1
End of historical L^AT_EX 2.09 comments.

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, \count 10 always contains the number of the highest-numbered counter that has been allocated, \count 14 the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a \count, \dimen, \skip, and \box all with the same number; \count 20 contains the lowest-numbered insert that has been allocated. Of course, \box255 is reserved for \output; \count255, \dimen255, and \skip255 can be used freely.

It is recommended that macro designers always use \global assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-\global assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```
26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...

`\alloc@` Since `\e@alloc` was added in 2015, `\alloc` has not been used, but was left as some legacy code calls it. However the original definition gives spurious errors once the “classic” registers run out, so it is now defined to call `\e@alloc` internally.

344 % \tracingpages=0
345 % \tracingoutput=0
```

In the past L^AT_EX used the default value of 1 for \tracinglostchars because this was the best it could do. This way one would at least get a warning in the .log file. e-T_EX improved on that and supported a value of 2 to show the warning on the terminal, so we could have changed the default when we made the e-T_EX extensions required—however, we overlooked that opportunity. In 2021 this parameter was improved on again and now also accepts the value 3 (error on the terminal). This made us realize that we should change the default. Using 3 would really be the best, but for compatibility reasons we only use 2.

```
346 \tracinglostchars=2
347 % \tracingcommands=0
348 % \tracingrestores=0
```

\tracingstacklevels For LuaT_EX, the \tracingstacklevels functionality was implemented as a callback, so here we just define the count register to hold the value of the parameter.

```

```
\bgroup
\egroup
450 \let\bgroup=
451 \let\egroup=
```

(End of definition for \bgroup and \egroup.)

\obeylines In \obeylines, we say \let^{^M}=\obeyedline instead of \def^{^M}{\obeyedline} since this allows, for example, \let\obeyedline=\cr \obeylines \halign{....}

This is essentially a plain TeX trick and in its original version where you had to use to use \let\par=\cr not really a safe idea in L^AT_EX. If anybody used this trick this now breaks (and one needs to use \obeyedline instead).

```
452 </2ekernel>
453 <*2ekernel | latexrelease>
454 <latexrelease>\IncludeInRelease{2022/06/01}{\obeylines}%
455 <latexrelease> {Add a redirection to obeylines and obeyspaces}%
```

If the active ^{^M} escapes, e.g., into a \write (which is effectively in a different context) then we don't want the definition from \obeylines but rather a simple \par (in fact even the primitive one, not the L^AT_EX version \para_end: which is only defined later).

```
456 \begingroup
457 \catcode`^\^M=\active % these lines must end with %
458 \gdef\obeylines{\catcode`^\^M\active%
459 \let^\^M\obeyedline%
```

The next line ending the definition is rather curious and it took me awhile to understand why rollback fails. The problem is the following: if `latexrelease` is used, then blocks of `\IncludeInRelease ... \EndIncludeInRelease` are bypassed at high speed by grabbing each as a delimited argument. However, in that case ^{^M} is seen not as code but as line ending characters and in that mode TeX discards everything from that point onwards to the real end of the line so it works like a comment — pretty strange really (and I think due to the fact that the original pascal compiler could have some garbage showing up after the normal line ending character). Thus we really have to make sure that any closing braces is not one the same line as an ^{^M}, because otherwise it would get dropped and we end with unbalanced braces and never see the `\EndIncludeInRelease` — weird. In other places it doesn't matter because we aren't using the incomplete result.

```
460 }%
461 \global\let^\^M\par % this is in case ^M appears in a \write
462 \endgroup
```

\obeyedline The \obeyedline expands by default to \par with whatever definition \par has when it is executed. It can, however, be redefined (before calling \obeylines!) to achieve some special effects. If you want to alter this definition when already in the scope of \obeylines, it has no effect (because \let is used above). In that case simply make another call to \obeylines immediately. As you are in a restricted scope all that happens is that your redefinition is applied.

For the default definition we have to use \def not \let because the meaning of \par can change and we want to use the one that is current when \obeylines act.

There is a small subtlety here: in an `\edef` the active `^M` stayed put (because it was equal to the primitive `\par`), now `\obeyedline` expands and you get what it contains, i.e., in that case `\par`, into the `\edef` or `\mark` unless we use `\protected` on it.

```
463 \protected\gdef\obeyedline{\par}
```

The definition of `\obeyspaces` is changed in the same way and now executes `\obeyedspace` for each active space.

```
\obeyedspace
```

```
464 \global\let\obeyedspace\space
465 \begingroup
466 \catcode`\ =\active%
467 \gdef\obeyspaces{\catcode`\ \active\let =\obeyedspace}%
```

An active space elsewhere generates `\space` by default (for example in a `\write`).

```
468 \global\let =\space%
469 \endgroup
470 {/2ekernel | latexrelease}
471 <latexrelease>\EndIncludeInRelease
472 <latexrelease>\IncludeInRelease{0000/00/00}{\obeylines}%
473 <latexrelease> {Add a redirection to obeylines and obeyspaces}%
474 <latexrelease>
```

From 2019 onwards the commands are made robust (somewhat later in the kernel sources). So if we roll back they are robust, so when redefining them we have to get rid of the robust payload first. Otherwise that is seen by the later rollback below, which then installs a fragile version of the new definition on top of the one we roll back to here, sigh. `\kernel@make@fragile` also changes its definition (later own) so this is done directly.

```
475 <latexrelease>\expandafter\let\csname obeylines \endcsname@\undefined
476 <latexrelease>\expandafter\let\csname obeyspace \endcsname@\undefined
477 <latexrelease>
478 <latexrelease>\begingroup
479 <latexrelease>\catcode`^M=\active % these lines must end with %
480 <latexrelease> \gdef\obeyspaces{\catcode`^M\active \let^M\par %
```

Closing brace on a separate line (see comment above).

```
481 <latexrelease> }%
```

Another pitfall: if we do a rollback `\par` is no longer the primitive, so the roll back definition needs `\let` to what is now the primitive.

```
482 <latexrelease> \global\let^M\RawParEnd % this is in case ^M appears in a \write
483 <latexrelease>\endgroup
484 <latexrelease>\def\obeyspaces{\catcode`\ \active}
485 <latexrelease>
486 <latexrelease>\let\obeyedline@\undefined
487 <latexrelease>\let\obeyedspace@\undefined
488 <latexrelease>\EndIncludeInRelease
489 {*2ekernel}
```

(End of definition for `\obeylines` and others.)

`\loop` We use Kabelschacht's method of doing loops, see TUB 8#2 (1987). (unless that breaks something :-). It turned out to need an extra `\relax`: see pr/642 (`\loop` could do one iteration too much in certain cases).

```
490 \long\def \loop #1\repeat{%
```

```

491 \def\iterate{\#1\relax % Extra \relax
492     \expandafter\iterate\fi
493 }
494 \iterate
495 \let\iterate\relax
496 }

```

This setting of `\repeat` is needed to make `\loop... \if... \repeat` skippable within another `\if....`

```
497 \let\repeat=\fi
```

(End of definition for `\loop`, `\iterate`, and `\repeat`.)

LATEX defines `\smallskip`, etc. in `ltspace.dtx`.

`\nointerlineskip`

`\offinterlineskip`

```

498 \def\nointerlineskip{\prevdepth-\@m\p@}
499 \def\offinterlineskip{\baselineskip-\@m\p@
500   \lineskip\z@\lineskiplimit\maxdimen}
```

(End of definition for `\nointerlineskip` and `\offinterlineskip`.)

`\vglue`

`\hglue`

```

501 \def\vglue{\afterassignment\vgl@{\skip@=}
502 \def\vgl@{\par \dimen@\prevdepth \hrule \height\z@
503   \nobreak\vskip\skip@ \prevdepth\dimen@}
504 \def\hglue{\afterassignment\hgl@{\skip@=}
505 \def\hgl@{\leavevmode \count@\spacefactor \vrule \width\z@
506   \nobreak\hskip\skip@ \spacefactor\count@}
```

(End of definition for `\vglue` and `\hglue`.)

LATEX defines `\~` in `ltdefns.dtx`.

`\slash`

This generates a / acting a bit like - but still allows hyphenation in the word part preceding it (but not after).

```
507 \def\slash{/\penalty\exhyphenpenalty}
```

(End of definition for `\slash`.)

`\break`

`\nobreak`

`\allowbreak`

```

508 \def\break{\penalty-\@M}
509 \def\nobreak{\penalty \@M}
510 \def\allowbreak{\penalty \z@}
```

(End of definition for `\break`, `\nobreak`, and `\allowbreak`.)

`\filbreak`

`\goodbreak`

```

511 \def\filbreak{\par\vfil\penalty-200\vfilneg}
512 \def\goodbreak{\par\penalty-500 }
```

(End of definition for `\filbreak` and `\goodbreak`.)

`\eject`

Define `\eject` as in plain TEX but define `\supereject` only in the compatibility file.

```
513 \def\eject{\par\break}
```

(End of definition for `\eject`.)

```

\removelastskip
514 \def\removelastskip{\ifdim\lastskip=\z@\else\vskip-\lastskip\fi}
(End of definition for \removelastskip.)
```

```

\smallbreak
\medbreak
\bigbreak
515 \def\smallbreak{\par\ifdim\lastskip<\smallskipamount
516   \removelastskip\penalty-50\smallskip\fi}
517 \def\medbreak{\par\ifdim\lastskip<\medskipamount
518   \removelastskip\penalty-100\medskip\fi}
519 \def\bigbreak{\par\ifdim\lastskip<\bigskipamount
520   \removelastskip\penalty-200\bigskip\fi}
```

(End of definition for \smallbreak, \medbreak, and \bigbreak.)

```

\math
521 \def\math{\mathsurround\z@}
```

(End of definition for \math.)

\underline Due to L^AT_EX's redefinition of \underline plain T_EX's \underline can be done in a simpler fashion (but do we need it at all?).

```

522 \def\underline#1{\underline{\sbox\tw@{\#1}\dp\tw@\z@\box\tw@}}
```

(End of definition for \underline.)

\strutbox L^AT_EX sets \strutbox in \set@fontsize.

```

\strut
523 \newbox\strutbox
524 \def\strut{\relax\ifmmode\copy\strutbox\else\unhcopy\strutbox\fi}
```

(End of definition for \strutbox and \strut.)

\hidewidth For alignment entries that can stick out.

```

525 \def\hidewidth{\hskip\hideskip}
```

(End of definition for \hidewidth.)

```

\narrower
526 \def\narrower{%
527   \advance\leftskip\parindent
528   \advance\rightskip\parindent}
```

(End of definition for \narrower.)

L^AT_EX defines \ae and similar commands elsewhere.

```

529 \chardef\%='\%
530 \chardef\&='\&
531 \chardef\#='\#
```

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

\leavevmode begins a paragraph, if necessary

```

532 \def\leavevmode{\unhbox\voidbox}
```

(End of definition for \leavevmode.)

```

\mathhexbox
533 \def\mathhexbox#1#2#3{\mbox{$\m@th \mathchar"#1#2#3$}}
(End of definition for \mathhexbox.)

\ialign
534 \def\ialign{\everycr{}\tabskip\z@skip\halign} % initialized \halign
(End of definition for \ialign.)

\oalign
\o@align
535 \def\oalign#1{\leavevmode\vtop{\baselineskip\z@skip \lineskip.25ex%
\o@align 536 \ialign{##\crcr#1\crcr}}}
537 \def\o@align{\lineskiplimit\z@ \oalign}
538 \def\ooalign{\lineskiplimit-\maxdimen \oalign}
(End of definition for \oalign, \o@align, and \ooalign.)

\sh@ft The definition of this macro in plain.tex was improved in about 1997; but as a result its usage was changed and its new definition is not appropriate for LATEX.
Since the version given here has been in use by LATEX for many years it does not seem prudent to remove it now. As far as we can tell it has only been used to define \b and \d but this cannot be certain.
539 \def\sh@ft#1{\dimen0.00#1ex\multiply\dimen@{\fontdimen1\font
540 \kern-.0156\dimen0} % compensate for slant in lowered accents
(End of definition for \sh@ft.)

\ltx@sh@ft This is the LATEX version of the second incarnation of the plain macro \sh@ft, which takes a dimension as its argument. It shifts a pseudo-accent horizontally by an amount proportional to the product of its argument and the slant-per-point (fontdimen 1).
541 \def\ltx@sh@ft #1{%
542 \dimen@ #1%
543 \kern \strip@pt
544 \fontdimen1\font \dimen@
545 } % kern by #1 times the current slant
(End of definition for \ltx@sh@ft.)
LATEX change: the text commands such as \d, \b, \c, \copyright, \TeX are now defined elsewhere.
LATEX change: Make \t work in a moving argument. Now defined elsewhere.

\hrulefill LATEX change: \kern\z@ added to end of \hrulefill and \dotfill to make them work in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). LATEX change: \leavevmode added at beginning of \dotfill and \hrulefill so that they work as expected in vertical mode.
546 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}
The box in \dotfill originally contained (in plain.tex):
\mkern 1.5mu .\mkern 1.5mu;
the width of .44em differs from this by .04pt which is probably an acceptable difference within leaders.
547 \def\dotfill{%
548 \leavevmode
549 \cleaders \hb@xt@ .44em{\hss.\hss}\hfill
550 \kern\z@}

```

(End of definition for \rulefill and \dotfill.)

INITEX sets `\sfcode x=1000` for all x, except that `\sfcode'X=999` for uppercase letters. The following changes are needed:

551 `\sfcode'\\)=0 \sfcode'\\'=0 \sfcode'\\]=0`

The `\nonfrenchspacing` macro will make further changes to `\sfcode` values.

Definitions related to output

`\magnification` doesn't work in LATEX.

```
def\magnification{\afterassignment\m@g\count@}
def\m@g{\mag\count@
\hsize6.5truein\vsiz8.9truein\dimen\footins8truein}
```

`\showoverfull` The following commands are used in debugging:

552 `\def\showoverfull{\tracingonline\@ne}`

(End of definition for `\showoverfull`.)

```
\showoutput
\loggingoutput 553 \gdef\loggingoutput{\tracingoutput\@ne
554     \showboxbreadth\maxdimen\showboxdepth\maxdimen\errorstopmode}
555 \gdef\showoutput{\loggingoutput\showoverfull}
556 </2ekernel>
```

(End of definition for `\showoutput` and `\loggingoutput`.)

File 03

ltvers.dtx

1 Version Identification

First we identify the date and version number of this release of L^AT_EX, and set \everyjob so that it is printed at the start of every L^AT_EX run.

```
\fmtname
\fmtversion
\latexreleaseversion
\patch@level
```

A \patch@level of 0 or higher denotes an official public release. A negative value indicates a candidate release that is not distributed.

If we put code updates into the kernel that are supposed to go into the next release we set the \patch@level to -1 and the \fmtversion / \latexreleaseversion to the dated of the next release (guessed, the real value is not so important and will get corrected when we make the release official).

If the \patch@level is already at -1 we do nothing here and use the \fmtversion date for any new \IncludeInRelease line when we add further code.

Finally, if we do make a public release we either just set the \patch@level to zero (if our initial guess was good) or we also change the date and then have to additionally change to that date on all the \IncludeInRelease statements that used the “guessed” date.

```
1  {*2ekernel}
2  \def\fmtname{LaTeX2e}
3  \edef\fmtversion
4  {/2ekernel}
5  \latexrelease{}\edef\latexreleaseversion
6  {*2ekernel | latexrelease}
7  {2025-06-01}
8  {/2ekernel | latexrelease}
9  {*2ekernel}
10 \def\patch@level{-2}
```

For more fine grain control there is the possibility to name the current development branch. This is only used when the \patch@level is negative (i.e., a pre-release format) and is intended to help us internally when we locally install a format out of some development branch.

```
11 \edef\development@branch@name{develop \the\year-\the\month-\the\day}
```

(End of definition for \fmtname and others.)

Check that the format being made is not too old. The error message complains about ‘more than 5 years’ but in fact the error is not triggered until 65 months.

This code is currently not activated as we don’t know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

```
12 \iffalse
13 \def\reserved@a{\#1/#2/#3\@nil}%
14 \count@\year
15 \advance\count@-\#1\relax
16 \multiply\count@ by 12\relax
17 \advance\count@\month
18 \advance\count@-\#2\relax}
19 \expandafter\reserved@a\fmtversion\@nil
```

\count0 is now the age of this file in months. Take a generous definition of ‘year’ so this message is not generated too often.

```

20 \ifnum\count@>65

If we roll back and the first patch already match then applying that is actually reapplying what is already in the format, i.e., it is useless and possibly allocating new registers. However, it makes the logic simpler so this is the way it is for now. In theory we could always jump over the first patch because that is only really needed for rolling forward. So maybe one day ...

File 04

ltluatex.dtx

1 Overview

LuaTeX adds a number of engine-specific functions to TeX. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for LuaTeX at the L^AT_EX 2 _{ε} kernel level plus as a loadable file which can be used with plain TeX and L^AT_EX.

This file contains code for both TeX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following \count registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
\e@alloc@whatsit@count User whatsits (default 261)
\e@alloc@bytecode@count Lua bytecodes (default 262)
\e@alloc@luachunk@count Lua chunks (default 263)
```

(\count 256 is used for \newmarks allocation and \count 257 is used for \newXeTeXintercharclass with XeTeX, with code defined in `ltfinal.dtx`). With any L^AT_EX 2 _{ε} kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L^AT_EX 2 _{ε} kernel did not provide any functionality for the extended allocation area).

2 Core TeX functionality

The commands defined here are defined for possible inclusion in a future L^AT_EX format, however also extracted to the file `ltluatex.tex` which may be used with older L^AT_EX formats, and with plain TeX.

```
\newattribute \newattribute{<attribute>}
Defines a named \attribute, indexed from 1 (i.e. \attribute0 is never defined). Attributes initially have the marker value -"7FFFFFFF ('unset') set by the engine.

\newcatcodetable \newcatcodetable{<catcodetable>}
Defines a named \catcodetable, indexed from 1 (\catcodetable0 is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).

\newluafunction \newluafunction{<function>}
Defines a named \luafunction, indexed from 1. (Lua indexes tables from 1 so \luafunction0 is not available).

\newluacmd \newluacmd{<function>}
Like \newluafunction, but defines the command using \luadef instead of just assigning an integer.
```

```

\newprotectedluacmd \newluadef{\function}
    Like \newluacmd, but the defined command is not expandable.
\newwhatsit \newwhatsit{\whatsit}
    Defines a custom \whatsit, indexed from 1.
\newluabytocode \newluabytocode{\bytocode}
    Allocates a number for Lua bytecode register, indexed from 1.
\newluachunkname \newluachunkname{\chunkname}
    Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the
    register (without backslash) into the lua.name table to be used in stack traces.
\catcodetable@initex Predefined category code tables with the obvious assignments. Note that the latex and
\catcodetable@string atletter tables set the full Unicode range to the codes predefined by the kernel.
\catcodetable@latex \setattribute{\attribute}{\value}
\catcodetable@atletter \unsetattribute{\attribute}
\setattribute Set and unset attributes in a manner analogous to \setlength. Note that attributes
\unsetattribute take a marker value when unset so this operation is distinct from setting the value to
zero.

```

3 Plain T_EX interface

The `ltluatex` interface may be used with plain T_EX using `\input{ltluatex}`. This inputs `ltluatex.tex` which inputs `etex.src` (or `etex.sty` if used with L^AT_EX) if it is not already input, and then defines some internal commands to allow the `ltluatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T_EX, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `ltluatex` code but implements a compatibility layer providing the interface of the original package.

4 Lua functionality

4.1 Allocators in Lua

```

new_attribute luatexbase.new_attribute(\attribute)
    Returns an allocation number for the \attribute, indexed from 1. The attribute will
    be initialised with the marker value -"7FFFFFFF ('unset'). The attribute allocation se-
    quence is shared with the TEX code but this function does not define a token using
    \attributedef. The attribute name is recorded in the attributes table. A metatable
    is provided so that the table syntax can be used consistently for attributes declared in
    TEX or Lua.
new_whatsit luatexbase.new_whatsit(\whatsit)
    Returns an allocation number for the custom \whatsit, indexed from 1.
new_bytocode luatexbase.new_bytocode(\bytocode)
    Returns an allocation number for a bytecode register, indexed from 1. The optional
    \name argument is just used for logging.
new_chunkname luatexbase.new_chunkname(\chunkname)
    Returns an allocation number for a Lua chunk name for use with \directlua and
    \latelua, indexed from 1. The number is returned and also \name argument is added
    to the lua.name array at that index.
new_luafunction luatexbase.new_luafunction(\functionname)

```

Returns an allocation number for a lua function for use with `\luafunction`, `\lateluafunction`, and `\luadef`, indexed from 1. The optional `<functionname>` argument is just used for logging.

These functions all require access to a named TeX count register to manage their allocations. The standard names are those defined above for access from TeX, e.g. `\e@alloc@attribute@count`, but these can be adjusted by defining the variable `<type>_count_name` before loading `ltluatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a TeX `\count` (`\countdef`'d token) called `attributetracker` in place of `\e@alloc@attribute@count`.

4.2 Lua access to TeX register numbers

```
registernumber luatexbase.registernumer(<name>)
```

Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by TeX. This package provides a function to look up the relevant number using LuaTeX's internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumer("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumer("#1") or "bad input")}%
}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@on}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with Lua^LA_TE_X then the following would be produced in the log and terminal output.

```
undefinedrubbish: \relax
    bad input
space: macro:->
    bad input
hbox: \hbox
    bad input
@MM: \mathchar"4E20
    20000
@tempdima: \dimen14
    14
@tempdimb: \dimen15
    15
strutbox: \char"B
    11
sixt@@n: \char"10
    16
myattr: \attribute12
    12
```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

4.3 Module utilities

```
provides_module luatexbase.provides_module(<info>)
```

This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L^AT_EX format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored. If the `version` begins with a digit, a `v` will be added at the start in the log.

```
module_info luatexbase.module_info(<module>, <text>)
module_warning luatexbase.module_warning(<module>, <text>)
module_error luatexbase.module_error(<module>, <text>)
```

These functions are similar to L^AT_EX's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done, you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

4.4 Callback management

```
add_to_callback luatexbase.add_to_callback(<callback>, <function>, <description>)
```

Registers the `<function>` into the `<callback>` with a textual `<description>` of the function. Functions are inserted into the callback in the order loaded.

`remove_from_callback luatexbase.remove_from_callback(<callback>, <description>)` Removes the callback function with `<description>` from the `<callback>`. The removed function and its description are returned as the results of this function.

`in_callback luatexbase.in_callback(<callback>, <description>)` Checks if the `<description>` matches one of the functions added to the list for the `<callback>`, returning a boolean value.

`disable_callback luatexbase.disable_callback(<callback>)` Sets the `<callback>` to `false` as described in the LuaTeX manual for the underlying `callback.register` built-in. Callbacks will only be set to false (and thus be skipped entirely) if there are no functions registered using the callback.

`callback_descriptions` A list of the descriptions of functions registered to the specified callback is returned. `{}` is returned if there are no functions registered.

`create_callback luatexbase.create_callback(<name>, <type>, <default>)` Defines a user defined callback. The last argument is a default function or `false`.

`call_callback luatexbase.call_callback(<name>, ...)` Calls a user defined callback with the supplied arguments.

`declare_callback_rule luatexbase.declare_callback_rule(<name>, <first>, <relation>, <second>)` Adds an ordering constraint between two callback functions for callback `<name>`.
The kind of constraint added depends on `<relation>`:

- before** The callback function with description `<first>` will be executed before the function with description `<second>`.
- after** The callback function with description `<first>` will be executed after the function with description `<second>`.
- incompatible-warning** When both a callback function with description `<first>` and with description `<second>` is registered, then a warning is printed when the callback is executed.
- incompatible-error** When both a callback function with description `<first>` and with description `<second>` is registered, then an error is printed when the callback is executed.
- unrelated** Any previously declared callback rule between `<first>` and `<second>` gets disabled.

Every call to `declare_callback_rule` with a specific callback `<name>` and descriptions `<first>` and `<second>` overwrites all previous calls with same callback and descriptions.

The callback functions do not have to be registered yet when the functions is called. Only the constraints for which both callback descriptions refer to callbacks registered at the time the callback is called will have an effect.

5 Implementation

¹ `(*2ekernel | tex | latexrelease)`
² `{2ekernel | latexrelease}\ifx\directlua\@undefined\else`

5.1 Minimum LuaTeX version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information

in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LuaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```

3  \langle latexrelease \rangle \IncludeInRelease{2015/10/01}
4  \langle latexrelease \rangle \newluafunction{LuaTeX}%
5  \ifnum\luatexversion<60 %
6    \wlog{*****}
7    \wlog{* LuaTeX version too old for ltluatex support *}
8    \wlog{*****}
9    \expandafter\endinput
10 \fi

```

Two simple L^AT_EX macros from `ltdefns.dtx` have to be defined here because `ltdefns.dtx` is not loaded yet when `ltluatex.dtx` is executed.

```

11 \long\def\@gobble#1{}
12 \long\def\@firstofone#1{#1}

```

5.2 Older L^AT_EX/Plain T_EX setup

```
13 <*tex>
```

Older L^AT_EX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```

14 \directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}
15 \ifx\@alloc\@undefined

```

In pre-2014 L^AT_EX, or plain T_EX, load `etex.{sty,src}`.

```

16 \ifx\documentclass\@undefined
17   \ifx\@alloc\@undefined
18     \input{etex.src}%
19   \fi
20   \catcode`\@=11 %
21   \outer\expandafter\def\csname newfam\endcsname
22     {\@alloc@8\fam\chardef\et@xmaxfam}%
23 \else
24   \RequirePackage{etex}
25   \expandafter\def\csname newfam\endcsname
26     {\@alloc@8\fam\chardef\et@xmaxfam}%
27   \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
28 \fi

```

5.2.1 Fixes to `etex.src/etex.sty`

These could and probably should be made directly in an update to `etex.src` which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX.

2015-07-13 higher range in luatex.

```

29 \edef\et@xmaxregs{\ifx\directlua\@undefined 32768\else 65536\fi}
luatex/xetex also allow more math fam.

```

```

30 \edef\et@xmaxfam{\ifx\Umathcode\@undefined\sixt@@n\else\@cclvi\fi}
31 \count270=\et@xmaxregs % locally allocates \count registers
32 \count271=\et@xmaxregs % ditto for \dimen registers
33 \count272=\et@xmaxregs % ditto for \skip registers
34 \count273=\et@xmaxregs % ditto for \muskip registers
35 \count274=\et@xmaxregs % ditto for \box registers

```

```

36 \count 275=\et@xmaxregs % ditto for \toks registers
37 \count 276=\et@xmaxregs % ditto for \marks classes
    and 256 or 16 fam. (Done above due to plain/LATEX differences in ltluatex.)
38 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}
    End of proposed changes to etex.src

```

5.2.2 luatex specific settings

Switch to global cf luatex.sty to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

39 \expandafter\let\csname newcount\expandafter\endcsname
40           \csname globcount\endcsname
41 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
42           \csname globdimen\endcsname
43 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
44           \csname globskip\endcsname
45 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
46           \csname globbox\endcsname

```

Define \e@alloc as in L^AT_EX (the existing macros in etex.src are hard to extend to further register types as they assume specific 26x and 27x count range). For compatibility the existing register allocation is not changed.

```

47 \chardef\e@alloc@top=65535
48 \let\@alloc\chardef\chardef
49 \def\@alloc#1#2#3#4#5#6{%
50   \global\advance#3\@ne
51   \e@ch@ck{#3}{#4}{#5}{#1%
52   \allocationnumber#3\relax
53   \global#2#6\allocationnumber
54   \wlog{\string#6=\string#1\the\allocationnumber}}%
55 \gdef\@ch@ck#1#2#3#4{%
56   \ifnum#1<#2\else
57     \ifnum#1=#2\relax
58       #1\@cclvi
59       \ifx\count#4\advance#1 10 \fi
60     \fi
61     \ifnum#1<#3\relax
62     \else
63       \errmessage{No room for a new \string#4}%
64     \fi
65   \fi}%

```

Fix up allocations not to clash with etex.src.

```

66 \expandafter\csname newcount\endcsname\@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\@alloc@luachunk@count

```

End of conditional setup for plain T_EX / old L^AT_EX.

```

72 \fi
73 </tex>

```

5.3 Attributes

- \newattribute** As is generally the case for the LuaTeX registers we start here from 1. Notably, some code assumes that \attribute0 is never used so this is important in this case.

```

74 \ifx\@alloc@attribute@count\@undefined
75   \countdef\@alloc@attribute@count=258
76   \@alloc@attribute@count=\z@
77 \fi
78 \def\newattribute#1{%
79   \@alloc@attribute\attributedef
80   \@alloc@attribute@count\m@ne\@alloc@top#1%
81 }

```

(End of definition for \newattribute.)

- \setattribute** Handy utilities.

```

82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

```

(End of definition for \setattribute and \unsetattribute.)

5.4 Category code tables

- \newcatcodetable** Category code tables are allocated with a limit half of that used by LuaTeX for everything else. At the end of allocation there needs to be an initialization step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```

84 \ifx\@alloc@ccodetable@count\@undefined
85   \countdef\@alloc@ccodetable@count=259
86   \@alloc@ccodetable@count=\z@
87 \fi
88 \def\newcatcodetable#1{%
89   \@alloc@catcodetable\chardef
90   \@alloc@ccodetable@count\m@ne{"8000}#1%
91   \initcatcodetable\allocationnumber
92 }

```

(End of definition for \newcatcodetable.)

- \catcodetable@initex** Save a small set of standard tables. The Unicode data is read here in using a parser simplified from that in `load-unicode-data`: only the nature of letters needs to be detected.

```

93 \newcatcodetable\catcodetable@initex
94 \newcatcodetable\catcodetable@string
95 \begingroup
96 \def\setrangingcatcode#1#2#3{%
97   \ifnum#1>#2 %
98     \expandafter\@gobble

171   }
172 \endgroup

```

(End of definition for `\catcodetable@initex` and others.)

5.5 Named Lua functions

`\newluafunction` Much the same story for allocating LuaTeX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```

173 \ifx\@alloc@luafunction@count\@undefined
174   \countdef\@alloc@luafunction@count=260
175   \@alloc@luafunction@count=\z@
176 \fi
177 \def\newluafunction{%
178   \@alloc@luafunction\@alloc@chardef
179   \@alloc@luafunction@count\m@ne\@alloc@top
180 }

```

(End of definition for `\newluafunction`.)

`\newluacmd` `\newprotectedluacmd` Additionally two variants are provided to make the passed control sequence call the function directly.

```

181 \def\newluacmd{%
182   \@alloc@luafunction\luadef
183   \@alloc@luafunction@count\m@ne\@alloc@top
184 }
185 \def\newprotectedluacmd{%
186   \@alloc@luafunction{\protected\luadef}
187   \@alloc@luafunction@count\m@ne\@alloc@top
188 }

```

(End of definition for `\newluacmd` and `\newprotectedluacmd`.)

5.6 Custom whatsits

`\newwhatst` These are only settable from Lua but for consistency are definable here.

```

189 \ifx\@alloc@whatst@count\@undefined
190   \countdef\@alloc@whatst@count=261
191   \@alloc@whatst@count=\z@
192 \fi
193 \def\newwhatst#1{%
194   \@alloc@whatst\@alloc@chardef
195   \@alloc@whatst@count\m@ne\@alloc@top#1%
196 }

```

(End of definition for \newwhatsit.)

5.7 Lua bytecode registers

\newluabytecode These are only settable from Lua but for consistency are definable here.

```
197 \ifx\@alloc@bytecode@count\@undefined
198   \countdef\@alloc@bytecode@count=262
199   \@alloc@bytecode@count=\z@
200 \fi
201 \def\newluabytecode#1{%
202   \@alloc@luabytecode\@alloc@chardef
203   \@alloc@bytecode@count\m@ne\@alloc@top#1%
204 }
```

(End of definition for \newluabytecode.)

5.8 Lua chunk registers

\newluachunkname As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```
205 \ifx\@alloc@luachunk@count\@undefined
206   \countdef\@alloc@luachunk@count=263
207   \@alloc@luachunk@count=\z@
208 \fi
209 \def\newluachunkname#1{%
210   \@alloc@luachunk\@alloc@chardef
211   \@alloc@luachunk@count\m@ne\@alloc@top#1%
212   {\escapechar\m@ne
213   \directlua{\lua.name[\the\allocationnumber]="\string#1"}}%
214 }
```

(End of definition for \newluachunkname.)

5.9 Lua loader

Lua code loaded in the format often has to be loaded again at the beginning of every job, so we define a helper which allows us to avoid duplicated code:

```
215 \def\now@and@everyjob#1{%
216   \everyjob\expandafter{\the\everyjob
217     #1%
218   }%
219   #1%
220 }
```

Load the Lua code at the start of every job. For the conversion of \TeX into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```
221 <2ekernel> \now@and@everyjob{%
222   \begingroup
223   \attributedef\attributezero=0 %
224   \chardef\charzero=0 %
```

Note name change required on older luatex, for hash table access.

```

225   \countdef \CountZero =0 %
226   \dimendef \dimenzero =0 %
227   \mathchardef \mathcharzero =0 %
228   \muskipdef \muskipzero =0 %
229   \skipdef \skipzero =0 %
230   \toksdef \tokszero =0 %
231   \directlua{require("ltluatex")}

232   \endgroup
233 {2ekernel}

286  </2ekernel | tex | latexrelease>

```

5.10 Lua module preliminaries

287 `(*lua)`

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase Set up the table for the returned functions. This is used to expose all of the public functions.

```

288 luatexbase      = luatexbase or { }
289 local luatexbase = luatexbase

```

(*End of definition for luatexbase.*)

Some Lua best practice: use local versions of functions where possible.

```

290 local string_gsub      = string.gsub
291 local tex_count         = tex.count
292 local tex_setcount      = tex.setcount
293 local texio_write_nl    = texio.write_nl
294 local flush_list        = node.flush_list

295 local luatexbase_warning
296 local luatexbase_error

```

5.11 Lua module utilities

5.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```
297 local modules = modules or { }
```

(*End of definition for modules.*)

provides_module Local function to write to the log.

```

298 local function luatexbase_log(text)
299   texio_write_nl("log", text)
300 end

```

Modelled on \ProvidesPackage, we store much the same information but with a little more structure.

```

301 local function provides_module(info)
302   if not (info and info.name) then
303     luatexbase_error("Missing module name for provides_module")
304   end
305   local function spaced(text)
306     return text and (" " .. text) or ""
307   end
308   luatexbase_log(
309     "Lua module: " .. info.name
310     .. spaced(info.date)
311     .. spaced(info.version and string.gsub(info.version or "", "%d", "v%1"))
312     .. spaced(info.description)
313   )
314   modules[info.name] = info
315 end
316 luatexbase.provides_module = provides_module

```

(End of definition for provides_module.)

5.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from T_EX. For errors we have to make some changes. Here we give the text of the error in the L^AT_EX format then force an error from Lua to halt the run. Splitting the message text is done using \n which takes the place of \MessageBreak.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```

317 local function msg_format(mod, msg_type, text)
318   local leader = ""
319   local cont
320   local first_head
321   if mod == "LaTeX" then
322     cont = string.gsub(leader, ".", " ")
323     first_head = leader .. "LaTeX: "
324   else
325     first_head = leader .. "Module " .. msg_type
326     cont = "(" .. mod .. ")"
327     .. string.gsub(first_head, ".", " ")
328     first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":" ..
329   end
330   if msg_type == "Error" then
331     first_head = "\n" .. first_head
332   end
333   if string.sub(text, -1) ~= "\n" then
334     text = text .. " "
335   end
336   return first_head .. " "
337   .. string.gsub(
338     text
339     .. "on input line "

```

```

340         .. tex.inputlineno, "\n", "\n" .. cont .. " "
341     )
342     .. "\n"
343 end

module_info Write messages.
module_warning local function module_info(mod, text)
module_error   texio_write_nl("log", msg_format(mod, "Info", text))
346 end
347 luatexbase.module_info = module_info
348 local function module_warning(mod, text)
349   texio_write_nl("term and log",msg_format(mod, "Warning", text))
350 end
351 luatexbase.module_warning = module_warning
352 local function module_error(mod, text)
353   error(msg_format(mod, "Error", text))
354 end
355 luatexbase.module_error = module_error

(End of definition for module_info, module_warning, and module_error.)
Dedicated versions for the rest of the code here.

356 function luatexbase_warning(text)
357   module_warning("luatexbase", text)
358 end
359 function luatexbase_error(text)
360   module_error("luatexbase", text)
361 end

```

5.12 Accessing register numbers from Lua

Collect up the data from the TEX level into a Lua table: from version 0.80, LuaTEX makes that easy.

```

362 local luaregisterbasetable = { }
363 local registermap = {
364   attributezero = "assign_attr" ,
365   charzero      = "char_given" ,
366   CountZero     = "assign_int" ,
367   dimenzero     = "assign_dimen" ,
368   mathcharzero  = "math_given" ,
369   muskipzero    = "assign_mu_skip" ,
370   skipzero      = "assign_skip" ,
371   tokszero      = "assign_toks" ,
372 }
373 local createtoken
374 if tex.luatexversion > 81 then
375   createtoken = token.create
376 elseif tex.luatexversion > 79 then
377   createtoken = newtoken.create
378 end
379 local hashtokens    = tex.hashtokens()
380 local luatexversion = tex.luatexversion
381 for i,j in pairs (registermap) do
382   if luatexversion < 80 then

```

```

383     luaregisterbasetable[hashtokens[i][1]] =
384         hashtokens[i][2]
385     else
386         luaregisterbasetable[j] = createtoken(i).mode
387     end
388 end

```

- registernumber** Working out the correct return value can be done in two ways. For older LuaTEX releases it has to be extracted from the `hashtokens`. On the other hand, newer LuaTEX's have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

389 local registernumber
390 if luatexversion < 80 then
391     function registernumber(name)
392         local nt = hashtokens[name]
393         if(nt and luaregisterbasetable[nt[1]]) then
394             return nt[2] - luaregisterbasetable[nt[1]]
395         else
396             return false
397         end
398     end
399 else
400     function registernumber(name)
401         local nt = createtoken(name)
402         if(luaregisterbasetable[nt.cmdname]) then
403             return nt.mode - luaregisterbasetable[nt.cmdname]
404         else
405             return false
406         end
407     end
408 end
409 luatexbase.registernumber = registernumber

```

(End of definition for `registernumber`.)

5.13 Attribute allocation

- new_attribute** As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

410 local attributes=setmetatable(
411 {}, {
412     __index = function(t,key)
413         return registernumber(key) or nil
414     end}
415 )
416 )
417 luatexbase.attributes = attributes
418 local attribute_count_name =
419             attribute_count_name or "e@alloc@attribute@count"
420 local function new_attribute(name)

422                 tex_count[attribute_count_name] + 1)
423     if tex_count[attribute_count_name] > 65534 then
424         luatexbase_error("No room for a new \\attribute")

```

```

425   end
426   attributes[name] = tex_count[attribute_count_name]
427   luatexbase_log("Lua-only attribute " .. name .. " = " ..
428                   tex_count[attribute_count_name])
429   return tex_count[attribute_count_name]
430 end
431 luatexbase.new_attribute = new_attribute

```

(End of definition for `new_attribute`.)

5.14 Custom whatsit allocation

`new_whatsit` Much the same as for attribute allocation in Lua.

```

432 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"
433 local function new_whatsit(name)
434   tex_setcount("global", whatsit_count_name,
435               tex_count[whatsit_count_name] + 1)
436   if tex_count[whatsit_count_name] > 65534 then
437     luatexbase_error("No room for a new custom whatsit")
438   end
439   luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
440                   tex_count[whatsit_count_name])
441   return tex_count[whatsit_count_name]
442 end
443 luatexbase.new_whatsit = new_whatsit

```

(End of definition for `new_whatsit`.)

5.15 Bytecode register allocation

`new_bytecode` Much the same as for attribute allocation in Lua. The optional `<name>` argument is used in the log if given.

```

444 local bytecode_count_name =
445           bytecode_count_name or "e@alloc@bytecode@count"
446 local function new_bytecode(name)
447   tex_setcount("global", bytecode_count_name,
448               tex_count[bytecode_count_name] + 1)
449   if tex_count[bytecode_count_name] > 65534 then
450     luatexbase_error("No room for a new bytecode register")
451   end
452   luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
453                   tex_count[bytecode_count_name])
454   return tex_count[bytecode_count_name]
455 end
456 luatexbase.new_bytecode = new_bytecode

```

(End of definition for `new_bytecode`.)

5.16 Lua chunk name allocation

`new_chunkname` As for bytecode registers but also store the name in the `lua.name` table.

```

457 local chunkname_count_name =
458           chunkname_count_name or "e@alloc@luachunk@count"
459 local function new_chunkname(name)

```

```

460     tex_setcount("global", chunkname_count_name,
461                     tex_count[chunkname_count_name] + 1)
462     local chunkname_count = tex_count[chunkname_count_name]
463     chunkname_count = chunkname_count + 1
464     if chunkname_count > 65534 then
465         luatexbase_error("No room for a new chunkname")
466     end
467     lua.name[chunkname_count]=name
468     luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
469                     chunkname_count .. "\n")
470     return chunkname_count
471 end
472 luatexbase.new_chunkname = new_chunkname

```

(End of definition for `new_chunkname`.)

5.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional `<name>` argument is used in the log if given.

```

473 local luafunction_count_name =
474                     luafunction_count_name or "e@alloc@luafunction@count"
475 local function new_luafunction(name)
476     tex_setcount("global", luafunction_count_name,
477                 math.max(
478                     #(lua.get_functions_table()),
479                     tex_count[luafunction_count_name])
480                     + 1)
481     lua.get_functions_table()[tex_count[luafunction_count_name]] = false
482     if tex_count[luafunction_count_name] > 65534 then
483         luatexbase_error("No room for a new luafunction register")
484     end
485     luatexbase_log("Lua function " .. (name or "") .. " = " ..
486                     tex_count[luafunction_count_name])
487     return tex_count[luafunction_count_name]
488 end
489 luatexbase.new_luafunction = new_luafunction

```

(End of definition for `new_luafunction`.)

5.18 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

5.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

Actually there are two tables: `realcallbacklist` directly contains the entries as described above while `callbacklist` only directly contains the already sorted entries. Other entries can be queried through `callbacklist` too which triggers a resort.

Additionally `callbackrules` describes the ordering constraints: It contains two element tables with the descriptions of the constrained callback implementations. It can additionally contain a `type` entry indicating the kind of rule. A missing value indicates a normal ordering constraint.

```

490 local realcallbacklist = {}
491 local callbackrules = {}
492 local callbacklist = setmetatable({}, {
493     __index = function(t, name)
494         local list = realcallbacklist[name]
495         local rules = callbackrules[name]
496         if list and rules then
497             local meta = {}
498             for i, entry in ipairs(list) do
499                 local t = {value = entry, count = 0, pos = i}
500                 meta[entry.description], list[i] = t, t
501             end
502             local count = #list
503             local pos = count
504             for i, rule in ipairs(rules) do
505                 local rule = rules[i]
506                 local pre, post = meta[rule[1]], meta[rule[2]]
507                 if pre and post then
508                     if rule.type then
509                         if not rule.hidden then
510                             assert(rule.type == 'incompatible-warning' and luatexbase_warning
511                                 or rule.type == 'incompatible-error' and luatexbase_error)(
512                                     "Incompatible functions \".. rule[1] .. \" and \".. rule[2]
513                                     .. \" specified for callback \".. name .. \".")
514                         rule.hidden = true
515                     end
516                 else
517                     local post_count = post.count
518                     post.count = post_count+1
519                     if post_count == 0 then
520                         local post_pos = post.pos
521                         if post_pos ~= pos then

675 }
676 luatexbase.callbacktypes=callbacktypes

```

Sometimes multiple callbacks correspond to a single underlying engine level callback. Then the engine level callback should be registered as long as at least one of these callbacks is in use. This is implemented through a shared table which counts how many of the involved callbacks are currently in use. The engine level callback is registered iff this count is not 0.

We add `mlist_to_hlist` directly to the list to demonstrate this, but the handler gets added later when it is actually defined.

All callbacks in this list are treated as user defined callbacks.

```

677 local shared_callbacks = {
678   mlist_to_hlist = {
679     callback = "mlist_to_hlist",
680     count = 0,
681     handler = nil,
682   },
683 }
684 shared_callbacks.pre_mlist_to_hlist_filter = shared_callbacks.mlist_to_hlist
685 shared_callbacks.post_mlist_to_hlist_filter = shared_callbacks.mlist_to_hlist

```

`callback.register` Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```

686 local callback_register = callback_register or callback.register
687 function callback.register()
688   luatexbase_error("Attempt to use callback.register() directly\n")
689 end

```

(End of definition for `callback.register`.)

5.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

`simple` is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of *data* for functions filtering node lists. Such functions are called with a node list head as the first argument and may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except for the following cases. If a function returns **false**, then **false** is immediately returned and the following functions are *not* called. If a function returns **true**, then the same head is passed to the next function. If all functions return **true**, then the original head is returned, otherwise the return value of the last function not returning **true** is used.

reverselist is a specialized variant of *list* which executes functions in inverse order.

exclusive is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered.

Handler for **data** callbacks.

```
690 local function data_handler(name)
691   return function(data, ...)
692     for _,i in ipairs(callbacklist[name]) do
693       data = i.func(data,...)
694     end
695     return data
696   end
697 end
```

Default for user-defined **data** callbacks without explicit default.

```
698 local function data_handler_default(value)
699   return value
700 end
```

Handler for **exclusive** callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
701 local function exclusive_handler(name)
702   return function(...)
703     return callbacklist[name][1].func(...)
704   end
705 end
```

Handler for **list** callbacks.

```
706 local function list_handler(name)
707   return function(head, ...)
708     local ret
709     for _,i in ipairs(callbacklist[name]) do
710       ret = i.func(head, ...)
711       if ret == false then
712         luatexbase_warning(
713           "Function '" .. i.description .. "' returned false\n"
714           .. "in callback '" .. name .. "'")
715       end
716     return false
717   end
```

```

718     if ret ~= true then
719         head = ret
720     end
721     end
722     return head
723 end
724 end

```

Default for user-defined `list` and `reverselist` callbacks without explicit default.

```

725 local function list_handler_default(head)
726     return head
727 end

```

Handler for `reverselist` callbacks.

```

728 local function reverselist_handler(name)
729     return function(head, ...)
730         local ret
731         local callbacks = callbacklist[name]
732         for i = #callbacks, 1, -1 do
733             local cb = callbacks[i]
734             ret = cb.func(head, ...)
735             if ret == false then
736                 luatexbase_warning(
737                     "Function '" .. cb.description .. "' returned false\n"
738                     .. "in callback '" .. name .. "'")
739             )
740             return false
741         end
742         if ret ~= true then
743             head = ret
744         end
745     end
746     return head
747 end
748 end

```

Handler for `simple` callbacks.

```

749 local function simple_handler(name)
750     return function(...)
751         for _,i in ipairs(callbacklist[name]) do
752             i.func(...)
753         end
754     end
755 end

```

Default for user-defined `simple` callbacks without explicit default.

```

756 local function simple_handler_default()
757 end

```

Keep a handlers table for indexed access and a table with the corresponding default functions.

```

758 local handlers = {
759     [data]      = data_handler,
760     [exclusive] = exclusive_handler,
761     [list]      = list_handler,
762     [reverselist] = reverselist_handler,

```

```

763 [simple]      = simple_handler,
764 }

769 [reverselist] = list_handler_default,
770 [simple]       = simple_handler_default,
771 }

```

5.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```
772 local user_callbacks_defaults = {}
```

`create_callback` The allocator itself.

```

773 local function create_callback(name, ctype, default)
774   local ctype_id = types[ctype]
775   if not name or name == ""
776   or not ctype_id
777   then
778     luatexbase_error("Unable to create callback:\n" ..
779                      "valid callback name and type required")
780   end
781   if callbacktypes[name] then
782     luatexbase_error("Unable to create callback '" .. name ..
783                      "':\ncallback is already defined")
784   end
785   default = default or defaults[ctype_id]
786   if not default then
787     luatexbase_error("Unable to create callback '" .. name ..
788                      "':\ndefault is required for '" .. ctype ..
789                      "', callbacks")
790   elseif type (default) ~= "function" then
791     luatexbase_error("Unable to create callback '" .. name ..
792                      "':\ndefault is not a function")
793   end
794   user_callbacks_defaults[name] = default
795   callbacktypes[name] = ctype_id
796 end
797 luatexbase.create_callback = create_callback

```

(End of definition for `create_callback`.)

`call_callback` Call a user defined callback. First check arguments.

```

798 local function call_callback(name,...)
799   if not name or name == "" then
800     luatexbase_error("Unable to create callback:\n" ..
801                      "valid callback name required")
802   end
803   if user_callbacks_defaults[name] == nil then
804     luatexbase_error("Unable to call callback '" .. name

```

```

805             .. "':\nunknown or empty")
806         end
807         local l = callbacklist[name]
808         local f
809         if not l then
810             f = user_callbacks_defaults[name]
811         else
812             f = handlers[callbacktypes[name]](name)
813         end
814         return f(...)
815     end
816     luatexbase.call_callback=call_callback

```

(End of definition for `call_callback`.)

`add_to_callback` Add a function to a callback. First check arguments.

```

817     local function add_to_callback(name, func, description)
818         if not name or name == "" then
819             luatexbase_error("Unable to register callback:\n" ..
820                             "valid callback name required")
821         end
822         if not callbacktypes[name] or
823             type(func) ~= "function" or
824             not description or
825             description == "" then
826             luatexbase_error(
827                 "Unable to register callback.\n\n"
828                 .. "Correct usage:\n"
829                 .. "add_to_callback(<callback>, <function>, <description>)"
830             )
831         end

```

Then test if this callback is already in use. If not, initialise its list and register the proper handler.

```

832     local l = realcallbacklist[name]
833     if l == nil then
834         l = { }
835         realcallbacklist[name] = l

```

Handle count for shared engine callbacks.

```

836     local shared = shared_callbacks[name]
837     if shared then
838         shared.count = shared.count + 1
839         if shared.count == 1 then
840             callback_register(shared.callback, shared.handler)
841         end

```

If it is not a user defined callback use the primitive callback register.

```

842     elseif user_callbacks_defaults[name] == nil then
843         callback_register(name, handlers[callbacktypes[name]](name))
844     end
845 end

```

Actually register the function and give an error if more than one exclusive one is registered.

```

846     local f = {

```

```

847     func      = func,
848     description = description,
849   }
850   if callbacktypes[name] == exclusive then
851     if #l == 1 then
852       luatexbase_error(
853         "Cannot add second callback to exclusive function\n" ..
854         name .. "'")
855     end
856   end
857   table.insert(l, f)
858   callbacklist[name] = nil

```

Keep user informed.

```

859   luatexbase_log(
860     "Inserting '" .. description .. "' in '" .. name .. "'."
861   )
862 end
863 luatexbase.add_to_callback = add_to_callback

```

(End of definition for add_to_callback.)

`declare_callback_rule` Add an ordering constraint between two callback implementations

```

864 local function declare_callback_rule(name, desc1, relation, desc2)
865   if not callbacktypes[name] or
866     not desc1 or not desc2 or
867     desc1 == "" or desc2 == "" then
868     luatexbase_error(
869       "Unable to create ordering constraint. "
870       .. "Correct usage:\n"

994       end
995     end
996   return d
997 end
998 luatexbase.callback_descriptions =callback_descriptions
(End of definition for callback_descriptions.)
```

- uninstall** Unlike at the TeX level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```

999 local function uninstall()
1000   module_info(
1001     "luatexbase",
1002     "Uninstalling kernel luatexbase code"
1003   )
1004   callback.register = callback_register
1005   luatexbase = nil
1006 end
1007 luatexbase.uninstall = uninstall
```

(End of definition for `uninstall`.)

- mlist_to_hlist** To emulate these callbacks, the “real” `mlist_to_hlist` is replaced by a wrapper calling the wrappers before and after.

```

1008 create_callback('pre_mlist_to_hlist_filter', 'list')
1009 create_callback('mlist_to_hlist', 'exclusive', node.mlist_to_hlist)
1010 create_callback('post_mlist_to_hlist_filter', 'reverselist')
1011 function shared_callbacks.mlist_to_hlist.handler(head, display_type, need_penalties)
1012   local current = call_callback("pre_mlist_to_hlist_filter", head, display_type, need_penalties)
1013   if current == false then
1014     flush_list(head)
1015     return nil
1016   end
1017   current = call_callback("mlist_to_hlist", current, display_type, need_penalties)
1018   local post = call_callback("post_mlist_to_hlist_filter", current, display_type, need_penalties)
1019   if post == false then
1020     flush_list(current)
1021     return nil
1022   end
1023   return post
1024 end
```

(End of definition for `mlist_to_hlist`.)

1.1 Loader

\@kernel@after@enddocument
\@kernel@after@enddocument@afterlastpage

These two kernel hooks are used by the shipout code. They are defined earlier here because the lhooks code adds material to them.

```
1  {*2ekernel | latexrelease}
2  <{latexrelease}>\IncludeInRelease{2020/10/01}%
3  <{latexrelease}> {kernel@enddocument hooks}{Define several kernel hooks}
```

We only initialize these kernel hooks if they are not already existing. Otherwise they would be set to \empty on rollback which would be wrong because code that has been added to them may still have to be executed in the rollback situation. Instead code that writes to them needs to handle the rollback as needed. It is likely that we have to change that approach in the future, but for now it should do. (It is enough to test only for the existence of one hook, as all got added at the same time.)

```
4  \ifx\@kernel@after@enddocument\@undefined
5    \let\@kernel@after@enddocument\empty
6    \let\@kernel@after@enddocument@afterlastpage\empty
```

For the similar reasons we also define those that are used in \document because they too get material added to in early modules.

```
7  \let\@kernel@before@begindocument\empty
8  \let\@kernel@after@begindocument\empty
9  \fi
10 <{latexrelease}>\EndIncludeInRelease
11 <{latexrelease}>\IncludeInRelease{0000/00/00}%
12 <{latexrelease}> {kernel@enddocument hooks}{Define several kernel hooks}
13 <{latexrelease}>\let\@kernel@after@enddocument\@undefined
14 <{latexrelease}>\let\@kernel@after@enddocument@afterlastpage\@undefined
15 <{latexrelease}>\let\@kernel@before@begindocument\@undefined
16 <{latexrelease}>\let\@kernel@after@begindocument\@undefined
17 <{/2ekernel | latexrelease}>
18 <{latexrelease}>\EndIncludeInRelease
```

(End of definition for \@kernel@after@enddocument and others.)

First define some blank commands, so that in case something goes wrong while loading expl3, we won't get strange Undefined control sequence errors.

```
19 <{*2ekernel | latexrelease}>

119 〈latexrelease〉      \ifdefinable\luatexversion\ifnum\luatexversion>94 1\fi\fi
120 〈latexrelease〉      >0 %
121 〈latexrelease〉    \else
122 〈latexrelease〉      \message{Skipping expl3-dependent extensions}
123 〈latexrelease〉      \expandafter\@gobbletwo
124 〈latexrelease〉    \fi
125 〈latexrelease〉  }
126 〈latexrelease〉  {%
127 〈latexrelease〉    \message{Skipping expl3-dependent extensions}%
128 〈latexrelease〉    \@gobbletwo
129 〈latexrelease〉  }%
130 〈latexrelease〉\input{expl3.ltx}
131 〈latexrelease〉\EndIncludeInRelease

```

Now in `\textrm{ latexrelease }` mode, redefine a few commands to avoid “already defined” errors.

```
132 〈latexrelease〉\@ifundefined{ExplSyntaxOff}{}{\@latexrelease@postltxpl}
```

1.2 Using `expl3` code

In order to ease the implementation of some new features in L^AT_EX 2 _{ε} we may (temporarily) use some coding based on the `expl3`-code. Such macros will eventually vanish and may be changed unannounced. They are there for internal use in the L^AT_EX 2 _{ε} kernel and are not meant to be used in third-party packages. These macros will always have the `@expl@` prefix in their name.

The rest of the name matches the `expl3` name but with all underscores replaced by @s and the : replaced by @@, e.g.,

```
\cs_new_eq:NN \@expl@tl@trim@spaces@apply@@nN \tl_trim_spaces_apply:nN
```

if that `expl3` command is needed in places that are others coded in L^AT_EX 2 _{ε} conventions.

In this file, each release of LaTeX adds an `\IncludeInRelease` block, in which the macros copied for that release were defined. In case a rollback is requested, the entire block is changed.

Each macro copied has a `\changes` entry to explain when and why it was copied, so that further to that may spot it easily.

Here `\cs_gset_eq:NN` is used, instead of the `new` variant because if different releases use that same name for different purposes, each can copy the macro without worrying about redefinitions.

```

133 〈latexrelease〉\IncludeInRelease{2020/10/01}{\@expl@cs@to@str@@N}%
134 〈latexrelease〉          {expl3 macros added for the 2020-10-01 release}%

```

The `expl3` activation needs to be inside the release guards as otherwise rolling forward is broken in old kernels that do not have `expl3` loaded.

```

135 \ExplSyntaxOn
136 \cs_gset_eq:NN \@expl@cs@to@str@@N \cs_to_str:N
137 \cs_gset_eq:NN \@expl@str@if@eq@nnTF \str_if_eq:nnTF

```

```

138 \cs_gset_eq:NN \Expl@cs@prefix@spec@@N \cs_prefix_spec:N
139 \cs_if_exist:NTF \cs_parameter_spec:N
140   { \cs_gset_eq:NN \Expl@cs@parameter@spec@@N \cs_parameter_spec:N }
141   { \cs_gset_eq:NN \Expl@cs@parameter@spec@@N \cs_argument_spec:N }
142 \cs_gset_eq:NN \__kernel_cs_parameter_spec:N \Expl@cs@parameter@spec@@N
143 \cs_gset_eq:NN \Expl@cs@replacement@spec@@N \cs_replacement_spec:N

144 \cs_gset_eq:NN \Expl@str@map@function@@NN \str_map_function:NN
145 \cs_gset_eq:NN \Expl@char@generate@@nn \char_generate:nn
146 \ExplSyntaxOff

```

Here we can't assume that `expl3` is available. It will be if we roll back but if this code is executed rolling forward it needs to be pure 2e.

```

147 \begin{texreleasenode}{EndIncludeInRelease}
148 \begin{texreleasenode}{IncludeInRelease{0000/00/00}}{\Expl@cs@to@str@@N}%
149 \begin{texreleasenode}{}{expl3 macros added for the 2020-10-01 release}%
150 \begin{texreleasenode}{\let \Expl@cs@to@str@@N \undefined}
151 \begin{texreleasenode}{\let \Expl@str@if@eq@nnTF \undefined}

156 \begin{texreleasenode}{\EndIncludeInRelease}
157 \end{texreleasenode}

```

2 Document-level command names for `expl3` functions

Current home for L3 programming layer functions that we make directly available at the document level. This section may need to be moved later (after `\NewDocumentCommand` is defined in case we want to use that in the setup).

`\fpeval` The expandable command `\fpeval` takes as its argument a floating point expression and produces a result using the normal rules of mathematics. As this command is expandable it can be used where TeX requires a number and for example within a low-level `\edef` operation to give a purely numerical result. See `usrguide3` for further explanation.

`\inteval` The expandable command `\inteval` takes as its argument an integer expression and `\dimeval` produces a result using the normal rules of mathematics. The operations recognised are `\skipeval` `+, -, *` and `/` plus parentheses. Division occurs with *rounding*, and ties are rounded away from zero. As this command is expandable it can be used where TeX requires a number and for example within a low-level `\edef` operation to give a purely numerical result. See `usrguide3` for further explanation. `\dimeval` and `\skipeval` are similar, but generate fixed and rubber length values, respectively.

<code>\fpeval</code>	A document level wrapper around the code level function for floating point calculations.
<code>\inteval</code>	
<code>\dimeval</code>	
<code>\skipeval</code>	158 <code>\begin{texreleasenode}{*2ekernel latexrelease}</code> 159 <code>\begin{texreleasenode}{\IncludeInRelease{2022/06/01}}{\fpeval}{fp and int calculations}</code> 160 <code>\begin{texreleasenode}{}{\ExplSyntaxOn}</code> 161 <code>\begin{texreleasenode}{\cs_new_eq:NN \fpeval \fp_eval:n}</code>

And a few more, this time wrappers around the eTeX primitives.

```
163 \cs_new_eq:NN \inteval \int_eval:n  
164 \cs_new_eq:NN \dimeval \dim_eval:n  
165 \cs_new_eq:NN \skipEval \skip_eval:n  
166 \ExplSyntaxOff  
  
(End of definition for \fpeval and others.)  
167 ⟨/2ekernel | latexrelease⟩  
168 ⟨latexrelease⟩\EndIncludeInRelease  
169 ⟨latexrelease⟩\IncludeInRelease{0000/00/00} %  
170 ⟨latexrelease⟩ \fpeval}{fp and int calculations} %  
171 ⟨latexrelease⟩  
172 ⟨latexrelease⟩\let\fpeval@undefined  
173 ⟨latexrelease⟩\let\inteval@undefined  
174 ⟨latexrelease⟩\let\dimeval@undefined  
175 ⟨latexrelease⟩\let\skipEval@undefined  
176 ⟨latexrelease⟩\EndIncludeInRelease
```

\UserName When declaring new commands with `\NewDocumentCommand` or `\NewCommandCopy`
\ExpandArgs or similar, it is sometimes necessary to “construct” the csname. As a general mechanism
the L3 programming layer has `\exp_args:N...` for this, but there is no mechanism for
it if `\ExplSyntaxOn` is not active. We therefore offer a few of these commands also with
CamelCase names.

\UserName A document wrapper for changing arguments to cs names for use with `\NewDocumentCommand`
\ExpandArgs and similar functions.

```
177 ⟨*2ekernel | latexrelease⟩  
178 ⟨latexrelease⟩\IncludeInRelease{2022/06/01} %  
179 ⟨latexrelease⟩ \ExpandArgs}{Some pre-expansion commands} %  
180 \ExplSyntaxOn  
181 \cs_new_eq:NN \UserName \use:c  
  
182 \cs_new:Npn \ExpandArgs #1  
183 {  
184   \cs_if_exist_use:cF { \exp_args:N #1 }  
185   { \msg_expandable_error:nnn { kernel } { unknown-arg-expansion } {#1} }  
186 }  
187 \msg_new:nnn { kernel } { unknown-arg-expansion }  
188 { Unknown-arg-expansion~"#1" }  
189 \ExplSyntaxOff
```

(End of definition for \UserName and \ExpandArgs.)

```
190 ⟨/2ekernel | latexrelease⟩  
191 ⟨latexrelease⟩\EndIncludeInRelease  
192 ⟨latexrelease⟩\IncludeInRelease{0000/00/00} %  
193 ⟨latexrelease⟩ \ExpandArgs}{Some pre-expansion commands} %  
194 ⟨latexrelease⟩  
195 ⟨latexrelease⟩\let\UserName@undefined  
196 ⟨latexrelease⟩\let\ExpandArgs@undefined  
197 ⟨latexrelease⟩\EndIncludeInRelease
```

\IfExplAtLeastTF A pretty simple wrapper.

```
\IfExplAtLeastTF  
198  {*2ekernel | latexrelease}  
199  \IncludeInRelease{2023/11/01}%  
200  \IfExplAtLeastTF{Test for expl3 date}%  
201  \def\IfExplAtLeastTF{\ifl@t@r\ExplLoaderFileDate}
```

(End of definition for `\IfExplAtLeastTF`.)

We make sure the command is always available.

```
202  /2ekernel | latexrelease  
203  \EndIncludeInRelease  
204  \IncludeInRelease{0000/00/00}%  
205  \IfExplAtLeastTF{Test for expl3 date}%  
206  \IfExplAtLeastTF{  
207  \def\IfExplAtLeastTF{\ifl@t@r\ExplLoaderFileDate}  
208  \EndIncludeInRelease
```

File 06

ltdefns.dtx

1 Definitions

This section contains commands used in defining other macros.

1 `(*2ekernel)`

1.1 Initex initializations

`\two@digits` Prefix a number less than 10 with ‘0’.

2 `\def\two@digits#1{\ifnum#1<10 0\fi\number#1}`

(*End of definition for \two@digits.*)

`\typeout` Display something on the terminal.

3 `/2ekernel`
4 `(*2ekernel | latexrelease)`
5 `\latexrelease\IncludeInRelease{2020/10/01}%`
6 `\latexrelease\{\typeout\allow "par" in \typeout\%`
7 `\protected\long\def\typeout#1{\begingroup`
8 `\set@display@protect`
9 `\def\par{\^J}%`
10 `\immediate\write\@unused{#1}\endgroup}`
11 `/2ekernel | latexrelease`
12 `\latexrelease\EndIncludeInRelease`
13 `\latexrelease\IncludeInRelease{0000/00/00}%`
14 `\latexrelease\{\typeout\allow "par" in \typeout\%`
15 `\latexrelease`
16 `\latexrelease\def\typeout#1{\begingroup\set@display@protect`
17 `\latexrelease\immediate\write\@unused{#1}\endgroup}`
18 `\latexrelease\EndIncludeInRelease`
19 `(*2ekernel)`

(*End of definition for \typeout.*)

`\newlinechar` A char to be used as new-line in output to files.

20 `\newlinechar`\^J`

(*End of definition for \newlinechar.*)

1.2 Saved versions of TeX primitives

The TeX primitive `\foo` is saved as `\@@foo`. The following primitives are handled in this way:

`\@@par`
21 `\let\@@par=\par`
22 `%\let\@@input=\input %% moved earlier`
23 `%\let\@@end=\end %%`

(*End of definition for \@@par.*)

\@@hyph Save original primitive definition.
²⁴ \let\@@hyph=\-
(End of definition for \@@hyph.)

\@@italiccorr Save the original italic correction.
²⁵ \let\@@italiccorr=\/
(End of definition for \@@italiccorr.)

\@height The following definitions save token space. E.g., using \@height instead of height saves
\@depth 5 tokens at the cost in time of one macro expansion.
\@width ²⁶ \def\@height{height} \def\@depth{depth} \def\@width{width}
\@minus ²⁷ \def\@minus{minus}
\@plus ²⁸ \def\@plus{plus}

The next one is another 100 tokens worth.
²⁹ \def\hb@xt@{\hbox to}
(End of definition for \@height and others.)

³⁰ \message{hacks,}
\hb@xt@

1.3 Command definitions

This section defines the following commands:

\@namedef {\langle NAME\rangle}
Expands to \def\langle NAME\rangle, except name can contain any characters.

\@nameuse {\langle NAME\rangle}
Expands to \langle NAME\rangle.

\@ifnextchar X{\langle YES\rangle}{\langle NO\rangle}
Expands to \langle YES\rangle if next character is an 'X', and to \langle NO\rangle otherwise. (Uses \reserved@a-\reserved@c.) NOTE: GOBBLES ANY SPACE FOLLOWING IT.

\@ifstar {\langle YES\rangle}{\langle NO\rangle}
Gobbles following spaces and then tests if next the character is a '*'. If it is, then it gobbles the '*' and expands to \langle YES\rangle, otherwise it expands to \langle NO\rangle.

\@dblarg {\langle CMD\rangle}{\langle ARG\rangle}
Expands to \{\langle CMD\rangle\}[\langle ARG\rangle]\{\langle ARG\rangle\}. Use \@dblarg\CS when \CS takes arguments [ARG1]{ARG2}, where default is ARG1 = ARG2.

\@ifundefined {\langle NAME\rangle}{\langle YES\rangle}{\langle NO\rangle}
: If \NAME is undefined then it executes \langle YES\rangle, otherwise it executes \langle NO\rangle. More precisely, true if \NAME either undefined or = \relax.

\@ifdefinable {\NAME}{\langle YES\rangle} Executes \langle YES\rangle if the user is allowed to define \NAME, otherwise it gives an error. The user can define \NAME if \@ifundefined{\NAME} is true, '\NAME' ≠ 'relax' and the first three letters of '\NAME' are not 'end', and if \endNAME is not defined.

\newcommand *{\langle FOO\rangle}{\langle i\rangle}{\langle TEXT\rangle}
User command to define \FOO to be a macro with i arguments (i = 0 if missing) having the definition \langle TEXT\rangle. Produces an error if \FOO already defined.

\renewcommand *{\langle FOO\rangle}{\langle i\rangle}{\langle TEXT\rangle}

```

Same as \newcommand, except it checks if \FOO already defined.
\newenvironment *{\{FOO\}}[\langle i\rangle]{\{DEF1\}}{\{DEF2\}}
equivalent to:
\newcommand{\FOO}[i]{\def{\endFOO}{DEF2}}
(or the appropriate star forms).

\renewenvironment
    Obvious companion to \newenvironment.

\@cons : See description of \output routine.
\@car \@car T1 T2 ... Tn\@nil == T1 (unexpanded)
\@cdr \@cdr T1 T2 ... Tn\@nil == T2 ... Tn (unexpanded)
\typeout {\langle message\rangle}
Produces a warning message on the terminal.

\typein {\langle message\rangle}
Types message, asks the user to type in a command, then executes it
\typein [(\CS)]{\MSG}
Same as above, except defines \CS to be the input instead of executing it.

\typein
 31 \def\typein{%
 32   \let\@typein\relax
 33   \@testopt\@xtypein\@typein}

 34 \ifx\directlua\undefined
 35 \def\@xtypein[#1]#2{%
 36   \typeout{#2}%
 37   \advance\endlinechar\@M
 38   \read\@inputcheck to#1%
 39   \advance\endlinechar-\@M
 40   \@typein}%

 41 \else
 42 \def\@xtypein[#1]#2{%
 43   \typeout{#2}%
 44   \begingroup \endlinechar\m@ne
 45   \read\@inputcheck to#1%
 46   \expandafter\endgroup
 47   \expandafter\def\expandafter#1\expandafter{#1}%
 48   \@typein}%

 49 \fi
(End of definition for \typein.)

\@namedef
 50 \def\@namedef#1{\expandafter\def\csname #1\endcsname}

(End of definition for \@namedef.)

\@nameuse
 51 \def\@nameuse#1{\csname #1\endcsname}
(End of definition for \@nameuse.)

```

```

\@cons
52 \def\@cons#1#2{\begingroup\let\@elt\relax\xdef#1{#1\@elt #2}\endgroup}
(End of definition for \@cons.)
```

```

\@car
\@cdr 53 \def\@car#1#2\@nil{#1}
54 \def\@cdr#1#2\@nil{#2}
(End of definition for \@car and \@cdr.)
```

```

\@carcube \@carcube T1 ... Tn\@nil = T1 T2 T3 , n > 3
55 ⟨/2ekernel⟩
56 ⟨latexrelease⟩\IncludeInRelease{2020/10/01}{\@carcube}{Make \@carcube long}%
57 ⟨*2ekernel | latexrelease⟩
58 \long\def\@carcube#1#2#3#4\@nil{#1#2#3}
59 ⟨/2ekernel | latexrelease⟩
60 ⟨latexrelease⟩\EndIncludeInRelease
61 %
62 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}{\@carcube}{Undo: Make \@carcube long}%
63 ⟨latexrelease⟩\def\@carcube#1#2#3#4\@nil{#1#2#3}
64 ⟨latexrelease⟩\EndIncludeInRelease
65 ⟨*2ekernel⟩
(End of definition for \@carcube.)
```

\@onlypreamble This macro adds its argument to the list of commands stored in \preamblecmds to be disabled after \begin{document}. These commands are redefined to generate \notprerr at this point.

```

66 \def\preamblecmds{}
67 \def\@onlypreamble#1{%
68   \expandafter\gdef\expandafter\preamblecmds\expandafter{%
69     \preamblecmds\do#1}}
70 \@onlypreamble\@onlypreamble
71 \@onlypreamble\preamblecmds
```

(End of definition for \@onlypreamble and \preamblecmds.)

\@star@or@long Look ahead for a *. If present reset \l@ngrel@x so that the next definition, #1, will be non-long.

```

72 \def\@star@or@long#1{%
73   \@ifstar
74   {\let\l@ngrel@x\relax#1}%
75   {\let\l@ngrel@x\long#1}}
```

(End of definition for \@star@or@long.)

\l@ngrel@x This is either \relax or \long depending on whether the *-form of a definition command is being executed.

```

76 \let\l@ngrel@x\relax
```

(End of definition for \l@ngrel@x.)

\newcommand User level \newcommand.

```

77 \def\newcommand{\@star@or@long\new@command}
```

```

\new@command 78 \def\new@command#1{%
79   \@testopt{\@newcommand#1}0}

(End of definition for \newcommand and \new@command.)

```

\@newcommand Handling arguments for \newcommand.

```

\@argdef 80 \def\@newcommand#1[#2]{%
81   \kernel@ifnextchar [ {\@xargdef#1[#2]}%
82     {\@argdef#1[#2]}}

```

Define #1 if it is definable.

Both here and in \@xargdef the replacement text is absorbed as an argument because if we are not allowed to make the definition we have to get rid of it completely.

```

83 \long\def\@argdef#1[#2]#3{%
84   \@ifdefinable #1{\@yargdef#1\@ne{#2}{#3}}}

```

Handle the second optional argument.

```

85 \long\def\@xargdef#1[#2][#3]#4{%
86   \@ifdefinable#1{%

```

Define the actual command to be:

```
\def\foo{\@protected@testopt\foo\\foo{default}}
```

where \\foo is a csname generated from applying \csname and \string to \foo, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of (re)newcommand.

```

87 \expandafter\def\expandafter#1\expandafter{%
88   \expandafter
89   \@protected@testopt
90   \expandafter
91   #1%
92   \csname\string#1\endcsname
93   {#3}}%

```

Now we define the internal macro ie \\foo which is supposed to pick up all arguments (optional and mandatory).

```

94 \expandafter\@yargdef
95   \csname\string#1\endcsname
96   \tw@
97   {#2}%
98   {#4}}}

```

(End of definition for \@newcommand, \@argdef, and \@xargdef.)

\@testopt This macro encapsulates the most common call to \@ifnextchar, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [need not be a single token but can be any sequence of commands that 'expects' to be followed by [. If this command were only used in \newcommand definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```

99 \long\def\@testopt#1#2{%
100  \kernel@ifnextchar[{\#1}{#1[{#2}]}}}

```

(End of definition for \@testopt.)

\@protected@testopt Robust version of \@testopt. The extra argument (#1) must be a single token. If protection is needed the call expands to \protect applied to this token, and the 2nd and 3rd arguments are discarded (by \cx\protect). Otherwise \@testopt is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the \ifx test.

```

101 \def\@protected@testopt#1{%
102   \ifx\protect\@typeset@protect
103     \expandafter\@testopt
104   \else
105     \cx\protect#1%
106   \fi}

```

(End of definition for \@protected@testopt.)

\@yargdef These generate a primitive argument specification, from a L^AT_EX [*digit*] form; in fact *digit* can be anything such that \number*digit* is single digit.

Reorganised slightly so that \renewcommand{\reserved@a}[1]{foo} works. I am not sure this is worth it, as a following \newcommand would over-write the definition of \reserved@a.

Recall that L^AT_EX2.09 goes into an infinite loop with
\renewcommand[1]{\@tempa}{foo}
(DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using #2 = \tw@ as the flag to surround the first argument with []). But the new method did not allow for the number of arguments #3 not being given as an explicit digit; hence (further expansion of this argument and use of) \number was added later in 1999.

It is not clear why these are still \long.

```

107 \long \def \@yargdef #1#2#3{%
108   \ifx#2\tw@
109     \def\reserved@b##1{####1}%
110   \else
111     \let\reserved@b\@gobble
112   \fi
113   \expandafter
114     \@yargd@f \expandafter{\number #3}#1%
115 }

116 \long \def \@yargd@f#1#2{%
117   \def \reserved@a ##1##2##{%
118     \expandafter\def\expandafter#2\reserved@b ##1##
119   }%
120   \l@ngrel@x \reserved@a 0##1##2##3##4##5##6##7##8##9##1%
121 }

```

(End of definition for \@yargdef and \@yargd@f.)

\@reargdef

```

122 \long\def\@reargdef#1[#2]{%
123   \@yargdef#1\@ne{#2}}

```

(End of definition for \@reargdef.)

- \renewcommand Check the command name is already used. If not give an error message. Then temporarily disable \@ifdefinable then call \newcommand. (Previous version \let#1=\relax but this does not work too well if #1 is \tempa-e.)
- 124 \def\renewcommand{\@star@or@long\renew@command}

```
125 \def\renew@command#1{%
126   \begingroup \escapechar`m@ne\xdef\@gtempa{{\string#1}}\endgroup
127   \expandafter\@ifundefined\@gtempa
128     {\@latex@error{Command \string#1 undefined}\@ehc}%
129     \relax
130   \let\@ifdefinable\@rc@ifdefinable
131   \new@command#1}
```

(End of definition for \renewcommand and \renew@command.)

- \@ifdefinable Test if user is allowed to define a command.
- \@@ifdefinable 132 \long\def\@ifdefinable #1#2{%
133 \edef\reserved@a{\expandafter\@gobble\string #1}%
134 \@ifundefined\reserved@a
135 {\edef\reserved@b{\expandafter\@carcube \reserved@a xxx\@nil}%
136 \ifx \reserved@b\@qend \notdefinable\else
137 \ifx \reserved@a\@qrelax \notdefinable\else
138 #2%
139 \fi
140 \fi}%
141 \notdefinable}
- Saved definition of \@ifdefinable.
- 142 \let\@@ifdefinable\@ifdefinable
- Version of \@ifdefinable for use with \renewcommand. Does not do the check this time, but restores the normal definition.
- 143 \long\def\@rc@ifdefinable#1#2{%
144 \let\@ifdefinable\@@ifdefinable
145 #2}

(End of definition for \@ifdefinable, \@@ifdefinable, and \@rc@ifdefinable.)

- \newenvironment Define a new user environment. #1 is the environment name. #2# Grabs all the tokens up to the first {. These will be any optional arguments. They are not parsed at this point, but are just passed to \@newenv which will eventually call \newcommand. Any optional arguments will then be parsed by \newcommand as it defines the command that executes the ‘begin code’ of the environment.

This #2# trick removed with version 1.2i as it fails if a { occurs in the optional argument. Now use \@ifnextchar directly.

146 \def\newenvironment{\@star@or@long\new@environment}

- \new@environment 147 \def\new@environment#1{%
148 \@testopt{\@newenva#1}0}

```

149 \def\@newenva#1[#2]{%
150   \kernel@ifnextchar [{\@newenvb#1[#2]}{\@newenv{#1}{[#2]}}}

151 \def\@newenvb#1[#2][#3]{\@newenv{#1}{[#2][[#3]]}}
152 (End of definition for \newenvironment and others.)

\renewenvironment Redefine an environment. For \renewenvironment disable \ifdefinable and then call
\newenvironment. It is OK to \let the argument to \relax here as there should not
be a @temp... environment.
152 \def\renewenvironment{\@star@or@long\renew@environment}

\renew@environment 153 \def\renew@environment#1{%
154   \@ifundefined{#1}{%
155     {\@latex@error{Environment #1 undefined}\@ehc
156     }\relax
157     \expandafter\let\csname#1\endcsname\relax
158     \expandafter\let\csname end#1\endcsname\relax
159     \new@environment{#1}}
160 (End of definition for \renewenvironment and \renew@environment.)

\@newenv The internal version of \newenvironment.
Call \newcommand to define the <begin-code> for the environment. \def is used for
the <end-code> as it does not take arguments. (but may contain \pars)
Make sure that an attempt to define a ‘graf’ or ‘group’ environment fails by tem-
porarily letting the undefined \... (begin code) to the definition of \end... and as a
result we get an error if that has a definition.
160 \long\def\@newenv#1#2#3#4{%
161   \@ifundefined{#1}{%
162     {\expandafter\let\csname#1\expandafter\endcsname
163      \csname end#1\endcsname}%
164     \relax
165     \expandafter\new@command
166     \csname #1\endcsname#2{#3}%
167     \l@ngrel@x\expandafter\def\csname end#1\endcsname{#4}}
168 (End of definition for \@newenv.)

\newif And here’s a different sort of allocation: For example, \newif\iffloor creates \foottrue,
\foofalse to go with \iffloor.
168 \def\newif#1{%
169   \count@\escapechar \escapechar\m@ne
170   \let#1\iffalse
171   \@if#1\iftrue
172   \@if#1\iffalse
173   \escapechar\count@}

```

```

\@if 174 \def\@if#1#2{%
175   \expandafter\def\csname\expandafter\@gobbletwo\string#1%
176     \expandafter\@gobbletwo\string#2\endcsname
177   {\let#1#2}}

```

(End of definition for `\newif` and `\@if`.)

`\providecommand` `\providecommand` takes the same arguments as `\newcommand`, but discards them if #1 is already defined. Otherwise it just acts like `\newcommand`. This implementation currently leaves any discarded definition in `\reserved@a` (and possibly `\\\reserved@a`) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

```
178 \def\providecommand{\@star@or@long\provide@command}
```

```

\provide@command 179 \def\provide@command#1{%
180   \begingroup
181     \escapechar\m@ne\xdef\@gtempa{\string#1}%
182   \endgroup
183   \expandafter\@ifundefined\@gtempa
184     {\def\reserved@a{\new@command#1}%
185     {\def\reserved@a{\renew@command\reserved@a}%
186     \reserved@a}%

```

(End of definition for `\providecommand` and `\provide@command`.)

`\CheckCommand` `\CheckCommand` takes the same arguments as `\newcommand`. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state before a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: `\newcommand\xxx[2][a]{(#1)(#2)}` then `\CheckCommand\xxx[2][b]{(#1)(#2)}` would *not* generate a warning, but, for instance `\CheckCommand\xxx[2]{(#1)(#2)}` would.

```
187 \def\CheckCommand{\@star@or@long\check@command}
```

`\CheckCommand` is only available in the preamble part of the document.

```
188 \onlypreamble\CheckCommand
```

```

\check@command 189 \def\check@command#1#2{\@check@c#1{#2}}
190 \onlypreamble\check@command

```

(End of definition for `\CheckCommand` and `\check@command`.)

`\@check@c` `\CheckCommand` itself just grabs all the arguments we need, without actually looking for [optional argument forms. Now define `\reserved@a`. If `\\\reserved@a` is then defined, compare it with the “`\#1`” otherwise compare `\reserved@a` with `#1`.

```

191 \long\def\@check@c#1#2#3{%
192   \expandafter\let\csname\string\reserved@a\endcsname\relax
193   \renew@command\reserved@a#2{#3}%
194   \@ifundefined{\string\reserved@a}%
195   {\@check@eq#1\reserved@a}%

```

```

196   {\expandafter\@check@eq
197     \csname\string#1\expandafter\endcsname
198     \csname\string\reserved@a\endcsname}}
199 \onlypreamble\@check@c

```

(End of definition for `\@check@c`.)

`\@check@eq` Complain if #1 and #2 are not `\ifx` equal.

```

200 \def\@check@eq#1#2{%
201   \ifx#1#2\else
202     \@latex@warning@no@line
203       {Command \noexpand#1 has
204        changed.\MessageBreak
205        Check if current package is valid}%
206   \fi}
207 \onlypreamble\@check@eq

```

(End of definition for `\@check@eq`.)

`\@gobble` The `\@gobble` macro is used to get rid of its argument.

```

\@gobbletwo 208 \long\def \@gobble #1{}
\@gobblethree 209 \long\def \@gobbletwo #1#2{}
\@gobblefour 210 \long\def \@gobblethree #1#2#3{}
211 \long\def \@gobblefour #1#2#3#4{}

```

(End of definition for `\@gobble` and others.)

There are also `\@gobble@om`, `\@gobble@som`, `\@gobble@with@sphack@om`, and `\@gobble@with@sphack@som`. They accept an optional and a mandatory argument, possibly preceded by a star. In all cases the expansion is empty or just manipulates the spaces around the command. Used to disable commands such as `\index` or `\label` in certain situations. Since they are defined with `\DeclareDocumentCommand`, which is not yet available at this point, the actual definition happens in `ltsect.dtx`.

`\@firstofone` Some argument-grabbers.

```

\@firstoftwo 212 \long\def\@firstofone#1{#1}
\@secondoftwo 213 \long\def\@firstoftwo#1#2{#1}
214 \long\def\@secondoftwo#1#2{#2}

```

`\@iden` is another name for `\@firstofone` for compatibility reasons.

```
215 \let\@iden\@firstofone
```

(End of definition for `\@firstofone` and others.)

`\@thirddofthree` Another grabber now used in the encoding specific section.

```
216 \long\def\@thirddofthree#1#2#3{#3}
```

(End of definition for `\@thirddofthree`.)

`\@expandtwoargs` A macro to totally expand two arguments to another macro

```

217 {/2ekernel}
218 {latexrelease}\IncludeInRelease{2022/11/01}%
219 {latexrelease} {\@expandtwoargs}{protected edef}%
220 {*2ekernel | latexrelease}

228  <latexrelease>\edef\reserved@a{\noexpand#1{#2}{#3}}\reserved@a}
229  <latexrelease>\EndIncludeInRelease
230  {*2ekernel}

```

(End of definition for `\@expandtwoargs`.)

`\@backslashchar` A category code 12 backslash.

```

231 \edef\@backslashchar{\expandafter\gobble\string\\}

```

(End of definition for `\@backslashchar`.)

1.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in L^AT_EX's commands. Whilst typesetting documents, L^AT_EX makes use of many of T_EX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by L^AT_EX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an `\edef`, `\message`, `\mark`, or other command which evaluates its argument fully.

The method L^AT_EX uses for making fragile commands robust is to precede them with `\protect`. This can have one of four possible values:

- `\relax`, for normal typesetting. So `\protect\foo` will execute `\foo`.
- `\string`, for writing to the screen. So `\protect\foo` will write `\foo`.
- `\noexpand`, for writing to a file. So `\protect\foo` will write `\foo` followed by a space.
- `\@unexpandable@protect`, for writing a moving argument to a file. So `\protect\foo` will write `\protect\foo` followed by a space. This value is also used inside `\edefs`, `\marks` and other commands which evaluate their arguments fully. More precisely, whenever the content of an `\edef` or `\xdef` etc. can contain arbitrary user input not under the direct control of the programmer, one should use `\proetected@edef` instead of `\edef`, etc., so that `\protect` has a suitable definition and the user input will not break if it contains fragile commands.

`\@unexpandable@protect`

```

232 \def\@unexpandable@protect{\noexpand\protect\noexpand}

```

(End of definition for `\@unexpandable@protect`.)

\DeclareRobustCommand
\declare@robustcommand This is a package-writers command, which has the same syntax as \newcommand, but which declares a protected command. It does this by having
\DeclareRobustCommand\foo
define \foo to be \protect\foo<space>, and then use \newcommand\foo<space>. Since the internal command is \foo<space>, when it is written to an auxiliary file, it will appear as \foo.

We have to be a bit cleverer if we're defining a short command, such as _, in order to make sure that the auxiliary file does not include a space after the command, since _ a and _a aren't the same. In this case we define _ to be:

```
\x@protect\_@protect\_<space>
```

which expands to:

```
\ifx\protect@typeset@protect\else
  \x@protect@_
\fi
\protect\_<space>
```

Then if \protect is \@typeset@protect (normally \relax) then we just perform _<space>, and otherwise \x@protect@ gobbles everything up and expands to \protect_.

Note: setting \protect to any value other than \relax whilst in ‘typesetting’ mode will cause commands to go into an infinite loop! In particular, setting \protect to \empty will cause _ to loop forever. It will also break lots of other things, such as protected \ifmmodes inside \haligns. If you really have to do such a thing, then please set \@typeset@protect to be \empty as well. (This is what the code for \patterns does, for example.)

More fun with \expandafter and \csname.

```
233 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
234 \def\declare@robustcommand#1{%
235   \ifx#1\undefined\else\ifx#1\relax\else
236     \@latex@info{Redefining \string#1}%
237   \fi\fi
238   \edef\reserved@a{\string#1}%
239   \def\reserved@b{#1}%
240   \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
241   \edef#1{%
242     \ifx\reserved@a\reserved@b
243       \noexpand\x@protect
244       \noexpand#1%
245     \fi
246     \noexpand\protect
247     \expandafter\noexpand\csname
248     \expandafter\gobble\string#1 \endcsname
249   }%
250   \let\@ifdefinable\@rc@ifdefinable
251   \expandafter\new@command\csname
252     \expandafter\gobble\string#1 \endcsname
253 }
```

(End of definition for \DeclareRobustCommand and \declare@robustcommand.)

```

\@x@protect
\x@protect 254 \def\x@protect#1{%
255   \ifx\protect\@typeset@protect\else
256     \@x@protect#1%
257   \fi
258 }
259 \def\@x@protect#1\fi#2#3{%
260   \fi\protect#1%
261 }

```

(End of definition for `\@x@protect` and `\x@protect`.)

`\@typeset@protect` We set `\@typeset@protect` to `\relax` rather than `\empty` to make sure that the protection mechanism stops the look-ahead and expansion performed at the start of `\halign` cells.

```
262 \let\@typeset@protect\relax
```

(End of definition for `\@typeset@protect`.)

`\set@display@protect` These macros set `\protect` appropriately for typesetting or displaying.

```

\set@typeset@protect 263 \def\set@display@protect{\let\protect\string}
264 \def\set@typeset@protect{\let\protect\@typeset@protect}
```

(End of definition for `\set@display@protect` and `\set@typeset@protect`.)

`\protected@edef`
`\protected@xdef`
`\unrestored@protected@xdef`
`\restore@protect` The commands `\protected@edef` and `\protected@xdef` perform ‘safe’ `\edefs` and `\xdefs`, saving and restoring `\protect` appropriately. For cases where restoring `\protect` doesn’t matter, there’s an ‘unsafe’ `\unrestored@protected@xdef`, useful if you know what you’re doing!

```

265 \def\protected@edef{%
266   \let\@@protect\protect
267   \let\protect\@unexpandable@protect
268   \afterassignment\restore@protect
269   \edef
270 }
271 \def\protected@xdef{%
272   \let\@@protect\protect
273   \let\protect\@unexpandable@protect
274   \afterassignment\restore@protect
275   \xdef
276 }
277 \def\unrestored@protected@xdef{%
278   \let\protect\@unexpandable@protect
279   \xdef
280 }
281 \def\restore@protect{\let\protect\@@protect}
```

(End of definition for `\protected@edef` and others.)

`\protect` The normal meaning of `\protect`

```
282 \set@typeset@protect
```

(End of definition for `\protect`.)

\MakeRobust This macro makes an existing fragile macro robust, but only if it hasn't been robust in the past, i.e., it checks for the existence of the macro $\langle \text{name} \rangle$ and if that exists it assumes that $\langle \text{name} \rangle$ is already robust. In that case either undefine the inner macro first or use \DeclareRobustCommand to define it in a robust way directly. We could probably test the top-level definition to have the right kind of structure, but this is somewhat problematical as we then have to distinguish between \long macros and others and also take into account that sometimes the top-level is deliberately done manually (like with \begin).

The macro firstly checks if the control sequence in question exists at all.

```

283  {/2ekernel}
284  <latexrelease>\IncludeInRelease{2020/10/01}{\MakeRobust}{\MakeRobust}%
285  {*2ekernel | latexrelease}
286  \def\MakeRobust#1{%
287    \count@=\escapechar
288    \escapechar='\\
289    \@ifundefined{\expandafter\gobble\string#1}{%
290      \@latex@error{Command '\string#1' undefined.}%
291      \MessageBreak There is nothing here to make robust}%
292    \c@eha
293  }%

```

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely foo_\llcorner . If it is already defined do nothing, otherwise set foo_\llcorner equal to foo and redefine foo so that it acts like a macro defined with \DeclareRobustCommand. We use \kernel@rename@newcommand to copy foo over to foo_\llcorner , including a possible default optional argument.

```

294  {%
295  \@ifundefined{\expandafter\gobble\string#1\space}{%
296  {%
297    \expandafter\kernel@rename@newcommand
298    \csname\expandafter\gobble\string#1\space\endcsname
299    #1%
300    \edef\reserved@a{\string#1}%
301    \def\reserved@b{#1}%
302    \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
303    \xdef#1{%
304      \ifx\reserved@a\reserved@b
305        \noexpand\x@protect\noexpand#1%
306      \fi
307      \noexpand\protect\expandafter\noexpand
308      \csname\expandafter\gobble\string#1\space\endcsname}%
309    }%
310    {\@latex@info{Command '\string#1' is already robust}}%
311  }%
312  \escapechar=\count@
313 }%

```

\kernel@rename@newcommand This macro renames a command, possibly with an optional argument (defined with \newcommand) from #2 to #1, by renaming the internal macro $\backslash\#2$ to $\backslash\#1$ and defining #1 appropriately, then undefining #2 and $\backslash\#2$. The \afterassignment trick is to make both definitions in \copy@newcommand global (which are local by default).

In case the macro was defined with \newcommand and an optional argument, to replicate exactly the behaviour of \DeclareRobustCommand we have to move also

the internal `\\\foo` to `\\\foo_`. In that case, #1 will be a parameterless macro (`\robust@command@chk@safe` checks that), and `\@if@newcommand` will return true (both defined below in this file). If so, we can use `\copy@newcommand` rather than plain `\let` to copy the command over. `\kernel@rename@newcommand` does this test and carries out the renaming.

```

`\kernel@make@fragile` The opposite of `\MakeRobust` except that it doesn't do many checks as it is internal to the kernel. Why does one want such a thing? Only for compatibility reasons if `\latexrelease` requests a rollback of the kernel. For this reason we pretend that this command existed in all earlier versions of L^AT_EX i.e., we are not rolling it back since we need it precisely then. But we have to get it into the `\latexrelease` file so that a roll forward is possible too.

1.5 Acting on robust commands

```

421   \langle /2ekernel \rangle
422   \langle latexrelease \rangle \IncludeInRelease{2020-10-01}{\robust@command@act}
423   \langle latexrelease \rangle {Add \robust@command@act}%
424   \langle *2ekernel | latexrelease \rangle

```

With most document level commands being robust now there is more of a requirement to have a standard way of aliasing (or copying) a command to a new name, for example to save an original definition before changing a command. \DeclareCommandCopy is analogous to L^AT_EX's \let, except that it copes with the different types of robust commands defined by L^AT_EX's mechanisms.

A couple of “types of robustness” are defined by the L^AT_EX 2 _{ε} kernel, namely robust commands defined with \DeclareRobustCommand and commands with optional arguments defined with \newcommand. However there are other types of robust commands that are frequently used, which are not defined in the L^AT_EX 2 _{ε} kernel, like commands defined with xparse's \NewDocumentCommand and etoolbox's \newrobustcmd.

In this section we will define a generic extensible machinery to act on robust commands. This code will then be used to test if a command is robust, considered the different types of robustness, and then either copy that definition, if \DeclareCommandCopy (or similar) is used, or show the definition of the command, if \ShowCommand is used.

The looping machinery is generic and knows nothing about what is to be done for each case. The syntax of the main macro \robust@command@act is:

```
\robust@command@act<action-list><robust-cmd>
      <fallback-action><act-arg>
```

<action-list> is a token list of the form:

```
{⟨if-type-1⟩ ⟨act-type-1⟩}
{⟨if-type-2⟩ ⟨act-type-2⟩}
...
```

\robust@command@act will iterate over the ⟨action-list⟩, evaluating each ⟨if-type-n⟩ ⟨robust-cmd⟩ {⟨true⟩}{⟨false⟩}. If the ⟨if-type-n⟩ conditional returns ⟨true⟩, then ⟨act-type-n⟩⟨act-arg⟩ is executed, and the loop ends. If the conditional returns ⟨false⟩, then ⟨if-type-n + 1⟩ is executed in the same way, until either one of the conditionals return ⟨true⟩, or the end of the ⟨action-list⟩ is reached. If the end is reached, then ⟨fallback-action⟩⟨act-arg⟩ is executed before \robust@command@act exits.

\robust@command@act will start by using \robust@command@act@chk@args to check if the ⟨robust-cmd⟩ (#2) is a parameterless (possibly \protected) macro. If it is not, the command is not a robust command: these always start with a parameterless user-level macro; in that case, \robust@command@act@end is used to short-circuit the process and do the ⟨fallback-action⟩ (#3). This first test is necessary because later on we need to be able to expand the ⟨robust-cmd⟩ without the risk of it Breaking Badly, and as a bonus, this speeds up the process in case we used \NewCommandCopy in a “normal” macro.

```
425 \long\def\robust@command@act#1#2#3#4{%
426   \robust@command@chk@saf#2%
427   {\expandafter\robust@command@act@loop
428     \expandafter#2%
429     #1{\@nnil\@nnil}%
430     \robust@command@act@end}%
431   {\robust@command@act@end}%
432   {#3}{#4}}%
```

If \robust@command@act@chk@args branched to false, then \robust@command@act@loop will loop over the list of items in the ⟨action-list⟩ (#1), and process each item as described earlier. If the ⟨if-type-n⟩ command expands to ⟨true⟩ then \robust@command@act@do is used to execute ⟨act-type-n⟩ on the ⟨act-arg⟩, otherwise the loop resumes with the next item.

```
433 \long\def\robust@command@act@loop#1#2{\robust@command@act@loop@aux#1#2}
434 \long\def\robust@command@act@loop@aux#1#2#3{%

1.5.1 Copying robust commands

```

471 </2ekernel>
472 <latexrelease>\IncludeInRelease{2020-10-01}{\DeclareCommandCopy}
473 <latexrelease> {Add \NewCommandCopy, \RenewCommandCopy, and \DeclareCommandCopy}%
474 <*2ekernel | latexrelease>

```

`\NewCommandCopy` `\RenewCommandCopy` `\DeclareCommandCopy` `\NewCommandCopy` starts by checking if #1 is already defined, and raises an error if so, otherwise the definition is carried out. `\RenewCommandCopy` does (almost) the opposite. If the command is *not* defined, then an error is raised. But the definition is carried out anyhow, so the behaviour is consistent with `\renewcommand`.

A `\ProvideCommandCopy` isn't defined because it's not reasonably useful. `\provide...` commands mean "define this if there's no other definition", but copying a command (usually) implies that the command being copied is defined, so `\ProvideCommandCopy` doesn't make a lot of sense. But more importantly, the most common use case of copying a command is to redefine it later, while preserving the old definition, as in:

```

\ProvideCommandCopy \A \B
\renewcommand \B { ... \A ... }

```

then, if `\A` is already defined the first line is skipped, an in this case `\B` won't work as expected.

The three versions call the internal `\declare@commandcopy` with the proper action. `\@firstofone` will carry out the copy. The only case when the copy is not made is the `<false>` case for `\NewCommandCopy`, in which the command already exists and the definition is aborted.

```

475 \def\NewCommandCopy{%
476   \declare@commandcopy

```

```

477      {\@firstofone}%
478      {\@firstoftwo\@notdefinable}%
479 \def\RenewCommandCopy{%

1.5.2 Showing robust commands

\ShowCommand Most of the machinery defined for \NewCommandCopy can be used to show the definition of a robust command, in a similar fashion to `texdef`. The difference is that after the command is detected to have a given type of robustness, rather than making a copy, we use a separate routine to show its definition.

With all the machinery in place, \ShowCommand itself is quite simple: we use \robust@command@act to iterate through the \@showcommandlisthook list, and if nothing is found, fallback to \show.

```

545 </2ekernel>
546 <latexrelease>\IncludeInRelease{2020-10-01}{\ShowCommand}%
547 <latexrelease> {Add \ShowCommand}%
548 <*2ekernel | latexrelease>
549 \long\def\ShowCommand#1{%
550   \robust@command@act
551   \@showcommandlisthook#1%
552   \show#1}

```

\@showcommandlisthook

The initial definition of \@showcommandlisthook contains the same tests as used for copying, but \@show@... commands instead of \copy@.... Same as before, it is initialized to cope with \DeclareRobustCommand and \newcommand with optional arguments.

```
553 \def\@showcommandlisthook{%
554   {\@if@DeclareRobustCommand \@show@DeclareRobustCommand}%
555   {\@if@newcommand \@show@newcommand}}
```

Now the rollback code.

```

562 <latexrelease>\EndIncludeInRelease
563 {*2ekernel}
```

(End of definition for \ShowCommand and \@showcommandlisthook.)

```
564 {/2ekernel}
565 <latexrelease>\IncludeInRelease{2020-10-01}{\@if@DeclareRobustCommand}
566 <latexrelease> {\Add {\@if@DeclareRobustCommand, \@if@newcommand,
567 <latexrelease> \copy@DeclareRobustCommand, \copy@newcommand,
568 <latexrelease> \show@DeclareRobustCommand, \show@newcommand}%
569 {*2ekernel | latexrelease}}
```

1.5.3 Commands defined with \DeclareRobustCommand

\@if@DeclareRobustCommand

Now that we provided a generic way to copy one macro to another, we need to define a way to check if a command is one of L^AT_EX 2 _{ε} 's robust types. These tests are heavily based on Heiko's \LetLtxMacro, but chopped into separate macros.

The command \@if@DeclareRobustCommand checks if a command \cmd was defined by \DeclareRobustCommand. The test returns true if the expansion of \cmd is exactly \protect\cmd.

```
570 \long\def\@if@DeclareRobustCommand#1{%
571   \begingroup
572   \escapechar='\\
573   \edef\reserved@a{\string#1}%
574   \edef\reserved@b{\detokenize{#1}}%
575   \xdef\@gtempa{%
576     \ifx\reserved@a\reserved@b
577       \noexpand\x@protect
578       \noexpand#1%
579     \fi
580     \noexpand\protect
581     \expandafter\noexpand\csname\@expl@cs@to@str@0N#1 \endcsname}%
582   \endgroup
583   \ifx\@gtempa#1\relax
584     \expandafter@\firstoftwo
585   \else
586     \expandafter@\secondoftwo
587   \fi}
```

```
\@copy@DeclareRobustCommand  
\copy@kernel@robust@command
```

If a command was defined by `\DeclareRobustCommand` (that is, `\@if@DeclareRobustCommand` returns true), then to make a copy of `\cmd` into `\foo` we define the latter such that it expands to `\protect\foo`, then make `\foo` equal to `\cmd`.

There is one detail we need to take care of: if a command was defined with `\DeclareRobustCommand` it may still have an optional argument, in which case there is one more macro layer before the actual definition of the command. We use `\@if@newcommand` to check that and `\@copy@newcommand` to do the copying.

```
588 \long\def\@copy@DeclareRobustCommand#1#2{  
589   \begingroup  
590     \escapechar='\\  
591     \edef\reserved@a{\string#1}%  
592     \edef\reserved@b{\detokenize{\#1}}%  
593     \edef\reserved@a{}%  
594   \endgroup  
595   \def\noexpand#1{  
596     \ifx\reserved@a\reserved@b  
597       \noexpand\x\protect  
598       \noexpand#1%  
599     \fi  
600     \noexpand\protect  
601     \expandafter\noexpand\csname\expl@cs@to@str@N#1 \endcsname}%  
602   \noexpand\copy@kernel@robust@command  
603     \expandafter\noexpand\csname\expl@cs@to@str@N#1 \endcsname  
604     \expandafter\noexpand\csname\expl@cs@to@str@N#2 \endcsname}%  
605   \reserved@a}  
606 \long\def\copy@kernel@robust@command#1#2{  
607   \robust@command@chk@safe#2%  
608   {\@if@newcommand#2%  
609     {\@copy@newcommand}%  
610     {\declare@commandcopy@let}}  
611     {\declare@commandcopy@let}%  
612   #1#2}
```

```
\@show@DeclareRobustCommand  
\show@kernel@robust@command  
\@show@macro
```

Showing the command is pretty simple. This command prints the top-level expansion as TeX's `\show` would, but with `robust` macro: rather than just `macro:`, then a blank line and then `\show` the inner command. For a macro defined with, say, `\DeclareRobustCommand\foo[1]{bar}`, it will print:

```
> \foo=robust macro:  
->\protect \foo .  
  
> \foo =\long macro:  
#1->bar.
```

If the inner command is defined with an optional argument, then `\@show@newcommand` is also used.

The value of `\escapechar` is deliberately not enforced, so `\ShowCommand` behaves more like `\show`.

```
613 \long\def\@show@DeclareRobustCommand#1{  
614   \typeout{> \string#1=robust macro:}%  
615   \typeout{->\expl@cs@replacement@spec@N#1.^^J}%  
616   \expandafter\show@kernel@robust@command  
617     \csname\expl@cs@to@str@N#1 \endcsname}
```

```

618 \long\def\show@kernel@robust@command#1{%
619   \robust@command@chk@safef#1%
620   {\@if@newcommand#1%
621     {\@show@newcommand}%
622     {\@show@macro}%
623     {\@show@macro}%
624   #1}
625 \let\@show@macro\show

```

(End of definition for `\@if@DeclareRobustCommand` and others.)

1.5.4 Commands defined with `\newcommand` (with optional argument)

`\@if@newcommand` A command `\cmd` (or `\cmd_`, if it was defined with `\DeclareRobustCommand`) with an optional argument will expand to `\@protected@testopt\cmd\cmd{<opt>}`. To check that we look at the first three tokens in the expansion of `\cmd`, and return true or false accordingly.

This test *requires* that the command be a parameterless macro, otherwise it will not work (and probably break). This is ensured with `\robust@command@chk@safef` before calling `\@if@newcommand`.

```

626 \long\def\@if@newcommand#1{%
627   \edef\reserved@a{%
628     \noexpand\@protected@testopt
629     \noexpand#1%
630     \expandafter\noexpand\csname\@backslashchar\expl@cs@to@str@@N#1\endcsname}%
631   \edef\reserved@b{%
632     \unexpanded\expandafter\expandafter\expandafter
633     {\expandafter\@carcube#1{}{}{}\@nil}}%
634   \ifx\reserved@a\reserved@b
635     \expandafter\@firstoftwo
636   \else
637     \expandafter\@secondoftwo
638   \fi}

```

Then, if a command `\cmd` takes an optional argument, we copy it to `\foo` by defining the latter to expand to `\@protected@testopt\foo\foo{<opt>}`.

```

639 \long\def\@copy@newcommand#1#2{%
640   \def#1{\noexpand\@protected@testopt
641     \noexpand#1%
642     \expandafter\noexpand\csname\@backslashchar\expl@cs@to@str@@N#1\endcsname
643     \unexpanded\expandafter\expandafter\expandafter
644     {\expandafter\@gobblethree#2}}%
645   \expandafter
646   \let\csname\@backslashchar\expl@cs@to@str@@N#1\expandafter\endcsname
647     \csname\@backslashchar\expl@cs@to@str@@N#2\endcsname}

```

`\@show@newcommand` A command being `\shown` here is guaranteed to have an optional argument. Start by showing the top-level expansion of the command (using `\typeout` to avoid TeX asking for interaction and extra context lines), then call `\@show@newcommand@aux` with the internal command, which contains the actual definition, and with the expansion of the command to extract the default value of the optional argument.

```

648 \long\def\@show@newcommand#1{%
649   \typeout{> \string#1=robust macro:}%

```

```

650  \typeout{->\expl@cs@replacement@spec@@N#1.^~J}%
651  \expandafter\show@newcommand@aux
652    \csname@\backslashchar\expl@cs@to@str@@N#1\expandafter\endcsname
653    \expandafter{\#1}\show@tokens}

```

For a macro defined with, say, `\newcommand\foo[1] [opt]{bar}`, it will print:

```

> \foo=robust macro:
->\protected@testopt \foo \\foo {opt}.

> \\foo=\long macro:
> default #1=opt.
[#1]->bar.

```

If the command was defined with `\DeclareRobustCommand`, then another pair of lines show the top-level expansion `\protect\foo`.

```

654 \long\def\show@newcommand@aux#1#2#3{%
655   \typeout{> \string#1=\expl@cs@prefix@spec@@N#1macro:}%
656   #3{default \string##1=\expandafter\detokenize\gobblethree#2.^~J}%
657   \expl@cs@parameter@spec@@N#1->\expl@cs@replacement@spec@@N#1}}

```

This macro prints the contents of the token list (macro) #1 using `\showtokens`. The `\expandafter` gymnastics ensures that `\showtokens` itself, and the internals of this macro aren't showed in the context lines.

```

658 \long\def\show@tokens#1{%
659   \edef\reserved@a{\#1}%
660   \showtokens\expandafter
661     \expandafter\expandafter{\expandafter\reserved@a}}

```

Now the rollback code.

```

662 </2ekernel | latexrelease>

(End of definition for `\if@newcommand` and others.)

1.5.5 Showing environments

\ShowEnvironment

```

680  </2ekernel>
681  <latexrelease>\IncludeInRelease{2023-06-01}{\ShowEnvironment}
682  <latexrelease> {Add \ShowEnvironment}%
683  {*2ekernel | latexrelease}

\ShowEnvironment is quite similar to \ShowCommand. We will pass the environment
<env> around as the macro \env, because \robust@command@act expects a single token.

684 \def\ShowEnvironment#1{%
685   \expandafter\@show@environment\csname #1\endcsname}
686 \long\def\@show@environment#1{%
687   \robust@command@act
688   \@showenvironmentlisthook#1%
689   \@show@normalenv#1}

```

This is similar to \@showcommandlisthook, but uses the dedicated versions for environments.

```

690 \def\@showenvironmentlisthook{%
691   {\@if@DeclareRobustCommand \@show@DeclareRobustCommand@env}%
692   {\@if@newcommand \@show@newcommand@env}}

```

These are similar to the command versions below, except they say “environment” and call \@show@environment@end to print the \end part.

```

693 \long\def\@show@newcommand@env#1{%
694   \@show@environment@begin#1%
695   \expandafter\@show@newcommand@aux
696   \csname\@backslashchar\@expl@cs@to@str@@N#1\expandafter\endcsname
697   \expandafter{\#1}\@show@typeout
698   \@show@environment@end#1}
699 \long\def\@show@DeclareRobustCommand@env#1{%
700   \@show@environment@begin#1%
701   \begingroup
702     \let\@show@tokens\@show@typeout
703     \let\@show@macro\@show@nonstop
704     \expandafter\show@kernel@robust@command
705     \csname\@expl@cs@to@str@@N#1 \endcsname
706   \endgroup
707   \@show@environment@end#1}
708 \long\def\@show@environment@begin#1{%
709   \typeout{> \string\begin{\@expl@cs@to@str@@N#1}=environment:}%
710   \typeout{\@expl@cs@parameter@spec@@N#1->%
711         \@expl@cs@replacement@spec@@N#1.^~J}}

```

A “normal” environment is straightforward. \@show@environment@end needs to check if the \end part is defined and show it accordingly, otherwise the output would show gibberish.

```

712 \long\def\@show@normalenv#1{%
713   \@show@environment@begin#1%
714   \@show@environment@end#1}
715 \long\def\@show@environment@end#1{%
716   \expandafter\@show@environment@end@aux
717   \csname end\@expl@cs@to@str@@N#1\endcsname#1}

```

```

718 \long\def\@showenvironment{\end{aux#1}#2{%
719   \@show@tokens{\string\end{\@expl@cs@to@str@@N#2}}%
720   \ifx\relax#1=undefined%
721   \else:^^J\@expl@cs@parameter@spec@@N#1->%
722     \@expl@cs@replacement@spec@@N#1%
723   \fi}}

```

And here some auxiliaries:

\@show@nonstop
\@show@typeout

\@show@nonstop same output as \show, but doesn't stop for interaction;

\@show@typeout same output as \showtokens, but doesn't stop for interaction.

```

724 \def\@show@nonstop#1{%
725   \typeout{> \string#1=\@expl@cs@prefix@spec@@N#1macro:^^J}%
726   \@expl@cs@parameter@spec@@N#1->\@expl@cs@replacement@spec@@N#1.}%
727 \def\@show@typeout#1{\typeout{> #1.^^J}}

```

Now the rollback code.

```

728 </2ekernel | latexrelease>
729 <latexrelease>\EndIncludeInRelease
730 <latexrelease>\IncludeInRelease{0000-00-00}{\ShowEnvironment}
731 <latexrelease> {Undefined \ShowEnvironment}%
732 <latexrelease>\let\ShowEnvironment\undefined
733 <latexrelease>\EndIncludeInRelease
734 {*2ekernel}

```

(End of definition for \ShowEnvironment and others.)

1.6 Internal defining commands

These commands are used internally to define other L^AT_EX commands.

\@ifundefined Check if first arg is undefined or \relax and execute second or third arg depending,

```

735 </2ekernel>
736 <latexrelease>\IncludeInRelease{2018-04-01}{\@ifundefined}
737 <latexrelease>{Leave commands undefined in \@ifundefined}%
738 {*2ekernel | latexrelease}

```

Version using \ifcsname to avoid defining undefined tokens to \relax. Defined here to simplify using unmatched \fi.

```

739 \def\@ifundefined#1{%
740   \ifcsname#1\endcsname\@ifundefined@#1\else\@ifundefined@#1\fi{#1}}
741 \long\def\@ifundefined@#1\fi#2{\fi
742   \expandafter\ifx\csname #2\endcsname\relax
743     \@ifundefined@#1
744   \fi
745   \@secondoftwo}
746 \long\def\@ifundefined@#1\fi#1#2#3{\fi #2}

```

Now test of engine.

```

747 \ifx\numexpr\undefined

```

Classic version (should not be needed as etex is assumed).

```
748 \def\@ifundefined#1{%
749   \expandafter\ifx\csname#1\endcsname\relax
750     \expandafter\@firstoftwo
751   \else
752     \expandafter\@secondoftwo
753   \fi}
754 \else\ifx\directlua\@undefined
```

Use the `\ifcsname` defined above.

```
755 \else
```

Optimised version for LuaTeX, using `\lastnamedcs`

```
756 \def\@ifundefined#1{%
757   \ifcsname#1\endcsname
758     \expandafter\ifx\lastnamedcs\relax\else\@ifundefined@d@i\fi
759   \fi
760   \@firstoftwo}
761 \long\def\@ifundefined@d@i#1#2#3#4#5{#1#2#5}
762 \fi
763 \fi
764 </2ekernel | latexrelease>
765 <latexrelease>\EndIncludeInRelease
766 <latexrelease>\IncludeInRelease{0000-00-00}{\@ifundefined}
767 <latexrelease>\Leave commands undefined in \@ifundefined}%
768 <latexrelease>\def\@ifundefined#1{%
769 <latexrelease> \expandafter\ifx\csname#1\endcsname\relax
770 <latexrelease> \expandafter\@firstoftwo
771 <latexrelease> \else
772 <latexrelease> \expandafter\@secondoftwo
773 <latexrelease> \fi
774 <latexrelease>\EndIncludeInRelease
775 <2ekernel>
```

(*End of definition for `\@ifundefined`.*)

`\@qend` The following define `\@qend` and `\@qrelax` to be the strings ‘end’ and ‘relax’ with the characters `\catcode` 12.

```
776 \edef\@qend{\expandafter\@cdr\string\end\@nil}
777 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}
```

(*End of definition for `\@qend` and `\@qrelax`.*)

`\@ifnextchar` `\@ifnextchar` peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.

```
778 \long\def\@ifnextchar#1#2#3{%
779   \let\reserved@d=#1%
780   \def\reserved@a{#2}%
781   \def\reserved@b{#3}%
782   \futurelet\@let@token\@ifnch}
```

(*End of definition for `\@ifnextchar`.*)

`\kernel@ifnextchar` This macro is the kernel version of `\@ifnextchar` which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos. For example, if an `fd` file is loaded in a random place then the optional argument to `\ProvidesFile` could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the `amsmath` package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

```
783 \let\kernel@ifnextchar\@ifnextchar
```

(End of definition for `\kernel@ifnextchar`.)

`\@ifnch` `\@ifnch` is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls `xifnch`.

```
784 \def\@ifnch{%
785   \ifx\@let@token\@sptoken
786     \let\reserved@c\@xifnch
787   \else
788     \ifx\@let@token\reserved@d
789       \let\reserved@c\reserved@a
790     \else
791       \let\reserved@c\reserved@b
792     \fi
793   \fi
794 }
```

(End of definition for `\@ifnch`.)

`\@sptoken` The following code makes `\@sptoken` a space token. It is important here that the control sequence `\:` consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a `\let` may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of `\:` as math medium space.

```
795 \def\:{\let\@sptoken= } \: % this makes \@sptoken a space token
```

(End of definition for `\@sptoken`.)

`\@xifnch` In the following definition of `\@xifnch`, `\:` is again used to get a space token as delimiter into the definition.

```
796 \def\:{\{\@xifnch\} \expandafter\def\:\ {\futurelet\@let@token\@ifnch\}}
```

(End of definition for `\@xifnch`.)

`\@ifstar` The new implementation below avoids passing the `\true code` through one more `\def` than the `\false code`, which previously meant that `#` had to be written as `####` in one argument, but `##` in the other. The `*` is gobbled by `\@firstoftwo`.

```
797 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{\#1}}}
```

(End of definition for `\@ifstar`.)

`\@dblarg`

`\@xdblarg` ⁷⁹⁸ `\long\def\@dblarg#1{\kernel@ifnextchar[{\#1}{\@xdblarg{\#1}}]}`
⁷⁹⁹ `\long\def\@xdblarg#1#2{\#1[{\#2}]{\#2}}`

(End of definition for \@dblarg and \@xdblarg.)

- \@sanitize The command \@sanitize changes the catcode of all special characters except for braces to ‘other’. It can be used for commands like \index that want to write their arguments verbatim. Needless to say, this command should only be executed within a group, or chaos will ensue.

```
800 \def\@sanitize{\@makeother\ \@makeother\\\@makeother\$@\makeother\&%
801 \@makeother\#\@makeother\^\@makeother\_@\makeother\%\@makeother\~}
```

(End of definition for \@sanitize.)

- \@onelevel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12 tokens: it could be used in \DeclareRobustCommand.

If it is to be used on default float specifiers, this should be done when they are defined.

```
802 \def \@onelevel@sanitize #1{%
803   \edef #1{\expandafter\strip@prefix
804           \meaning #1}%
805 }
```

(End of definition for \@onelevel@sanitize.)

- \string@makeletter \string@makeletter \char@if@alph Iterates through a string, turning each alphabetic character into a catcode-11 token (partly undoes a \detokenize). Useful for \ifx-based string comparisons where \detokenize-ing the other string would break too much code.

The macro uses expl3’s \expl@str@map@function@@NN to iterate on the string (without losing spaces) and applies \string@makeletter on each character. The latter checks if character is between a–z or A–Z, and uses \alph or \Alph to get the corresponding catcode-11 token. Other tokens are passed through unchanged.

```
806 ⟨/2ekernel⟩
807 ⟨latexrelease⟩\IncludeInRelease{2020/10/01}{\string@makeletter}
808 ⟨latexrelease⟩ {Add \string@makeletter}%
809 ⟨*2ekernel | latexrelease⟩
810 \def\string@makeletter#1{%
811   \expl@str@map@function@@NN#1\@string@makeletter}
812 \def\@string@makeletter#1{%
813   \char@if@alph{#1}%
814   {\expl@char@generate@@nn{'#1}{11}}%
815   {'#1}}
816 \def\char@if@alph#1{%
817   \ifnum0\ifnum`#1<`A 1\fi\ifnum`#1>`z 1\fi
818     \if\ifnum`#1>`Z @\fi\ifnum`#1<`a @\fi01\fi>
819     \expandafter\@secondoftwo
820   \else
821     \expandafter\@firstoftwo
822   \fi}
823 ⟨/2ekernel | latexrelease⟩
824 ⟨latexrelease⟩\EndIncludeInRelease
825 %
826 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}{\string@makeletter}
827 ⟨latexrelease⟩ {Undefine \string@makeletter}%
828 ⟨latexrelease⟩\let\string@makeletter\@undefined
829 ⟨latexrelease⟩\let\@string@makeletter\@undefined
```

```

830  ⟨latexrelease⟩\let\char@if@alph\@undefined
831  ⟨latexrelease⟩\EndIncludeInRelease
832  ⟨*2ekernel⟩

```

(End of definition for `\string@makeletter`, `\@string@makeletter`, and `\char@if@alph`.)

`\makeatletter` Make internal control sequences accessible or inaccessible.
`\makeatother` `\DeclareRobustCommand\makeatletter{\catcode`@11\relax}`
`\DeclareRobustCommand\makeatother{\catcode`@12\relax}`

(End of definition for `\makeatletter` and `\makeatother`.)

2 Discretionary Hyphenation

`\-` Moved here to be after the definition of `\DeclareRobustCommand`.
The primitive `\-` command adds a discretionary hyphen using the current font's `\hyphenchar`. Monospace fonts are usually declared with `\hyphenchar` set to `-1` to suppress hyphenation.

LATEX, from LATEX2.09 in 1986 defined `\-` by

```
\def\-\{\discretionary{-}{}{}\}
```

The following comment was added when these commands were first set up, 19 April 1986:

the `\-` command is redefined to allow it to work in the `\ttfamily` type style, where automatic hyphenation is suppressed by setting `\hyphenchar` to `-1`. The original primitive `TEX` definition is saved as `\@@hyph` just in case anyone needs it.

LATEX 2_ε, between 1993 and 2017, had a comment at this point saying that the definition “would probably change” because the definition always uses `-`. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older `LATEX` definition accessible via `latexrelease` as usual.

In `LuaLATEX` the primitive definition of `\-` is used directly because it's use of extended hyphenation parameters means that `\-` works correctly even with `\hyphenchar` set to `-1`. This change makes `\-` under `LuaLATEX` compatible with language specific hyphenation characters.

Temporary definition of `\@latex@info`, final definition is later.

```

835 \def\@latex@info#1{%

File 07

ltcmd.dtx

1 Creating document commands

Document commands should be created using the tools provided by this module: `\NewDocumentCommand`, etc., in almost all cases. This allows clean separation of document-level syntax from code-level interfaces. Users have a need to create new document commands, and as such a significant amount of documentation for `ltcmd` is provided as part of `usrguide3`. Here, additional material aimed at programmers is provided

```
1 <@@=cmd>
2 <*2ekernel>
3 \message{document commands,}
4 </2ekernel>
```

`ltcmd` code contains an `\^@` character, which usually has catcode 15, so `\IncludeInRelease` will break when this code is being skipped, so we'll save the catcode of `\^@` to restore later:

```
5 <*2ekernel | latexrelease>
6 <| latexrelease>\edef\@latexrelease@catcode@null{\the\catcode`\^@ }
7 <| latexrelease>\catcode`\^@=12
8 \ExplSyntaxOn
9 <| latexrelease>\NewModuleRelease{2020/10/01}{ltcmd}
10 <| latexrelease>           {Document~command~parser}%
11 \cs_generate_variant:Nn \tl_head:n { e }
```

1.1 Variables and constants

`\l__cmd_arg_spec_tl` Holds the argument specification after normalization of shorthands.

```
12 \tl_new:N \l__cmd_arg_spec_tl
```

`\l__cmd_args_tl` Token list variable for grabbed arguments.

```
13 \tl_new:N \l__cmd_args_tl
```

`\l__cmd_args_i_tl` Hold the modified arguments when dealing with default values or processors.

`\l__cmd_args_ii_tl`

```
14 \tl_new:N \l__cmd_args_i_tl
15 \tl_new:N \l__cmd_args_ii_tl
```

`\l__cmd_current_arg_int` The number of the current argument being set up: this is used to make sure there are at most 9 arguments, then for creating the expandable auxiliary functions and knowing how many arguments the code function should take.

```
16 \int_new:N \l__cmd_current_arg_int
```

\l__cmd_total_args_int The total number of arguments found during normalization: this is required where special action is needed for the penultimate argument.

17 \int_new:N \l__cmd_total_args_int

\l__cmd_defaults_bool The boolean indicates whether there are any argument with default value other than -NoValue-; the token list holds the code to determine these default values in terms of other arguments.

18 \bool_new:N \l__cmd_defaults_bool
19 \tl_new:N \l__cmd_defaults_tl

\l__cmd_environment_bool Generating environments uses the same mechanism as generating functions. However, full processing of arguments is always needed for environments, and so the function-generating code needs to know this. This variable is also used at run time to give correct error messages.

20 \bool_new:N \l__cmd_environment_bool

\l__cmd_environment_str Name of the environment, used at definition time and at run time.

21 \str_new:N \l__cmd_environment_str

\l__cmd_expandable_bool Used to indicate if an expandable command is begin generated, as this affects both the acceptable argument types and how they are implemented.

22 \bool_new:N \l__cmd_expandable_bool

\l__cmd_expandable_aux_name_tl

Used to create pretty-printing names for the auxiliaries: although the immediate definition does not vary, the full expansion does and so it does not count as a constant.

23 \tl_new:N \l__cmd_expandable_aux_name_tl
24 \tl_set:Nn \l__cmd_expandable_aux_name_tl
25 {
26 \l__cmd_function_tl \c_space_tl
27 (arg~ \int_use:N \l__cmd_current_arg_int)
28 }

\g__cmd_grabber_int Used (in exceptional cases) to get unique names for grabbers used by expandable commands.

29 \int_new:N \g__cmd_grabber_int

\l__cmd_fn_tl For passing the pre-formed name of the auxiliary to be used as the parsing function.

30 \tl_new:N \l__cmd_fn_tl

\l__cmd_fn_code_tl For passing the pre-formed name of the auxiliary that contains the actual code.

³¹ \tl_new:N \l__cmd_fn_code_tl

\l__cmd_function_tl Holds the control sequence name of the function currently being defined: used to avoid passing this as an argument and to avoid repeated use of \cs_to_str:N.

³² \tl_new:N \l__cmd_function_tl

\l__cmd_grab_expandably_bool

When defining a non-expandable command, indicates whether the arguments can all safely be grabbed by expandable grabbers. This is to support abuses of `xparse` that use protected functions inside csname constructions.

³³ \bool_new:N \l__cmd_grab_expandably_bool

\l__cmd_obey_spaces_bool For trailing optionals.

³⁴ \bool_new:N \l__cmd_obey_spaces_bool

\l__cmd_last_delimiters_tl Holds the delimiters (first tokens) of all optional arguments since the previous mandatory argument, to warn about cases where it would be impossible to omit optional arguments completely because the following mandatory argument has the same delimiter as one of the optional arguments.

³⁵ \tl_new:N \l__cmd_last_delimiters_tl

\l__cmd_long_bool Used to indicate that an argument is long, on a per-argument basis.

³⁶ \bool_new:N \l__cmd_long_bool

\l__cmd_suppress_strip_bool

Used to indicate that an a pair of braces should not be stripped from an optional argument.

³⁷ \bool_new:N \l__cmd_suppress_strip_bool

\l__cmd_m_args_int The number of `m` arguments: if this is the same as the total number of arguments, then a short-cut can be taken in the creation of the grabber code.

³⁸ \int_new:N \l__cmd_m_args_int

\l__cmd_prefixed_bool When preparing the signature of non-expandable commands, indicates that the current argument is affected by a processor or by `+` (namely is long).

³⁹ \bool_new:N \l__cmd_prefixed_bool

`\l__cmd_process_all_t1` When preparing the signature, the processors that will be applied to a given argument are collected in `\l__cmd_process_one_t1`, while `\l__cmd_process_all_t1` contains processors for all arguments. The boolean indicates whether there are any processors (to bypass the whole endeavour otherwise).

```
40 \tl_new:N \l__cmd_process_all_t1
41 \tl_new:N \l__cmd_process_one_t1
42 \bool_new:N \l__cmd_process_some_bool
```

`\l__cmd_saved_args_t1` Stores `\l__cmd_args_t1` to deal with space-trimming of b-type arguments.

```
43 \tl_new:N \l__cmd_saved_args_t1
```

`\l__cmd_signature_t1` Used when constructing the signature (code for argument grabbing) to hold what will become the implementation of the main function. When arguments are grabbed (at point of use of the command/environment), it also stores the code for grabbing the remaining arguments.

```
44 \tl_new:N \l__cmd_signature_t1
```

`\l__cmd_some_obey_spaces_bool`
`\l__cmd_some_long_bool`
`\l__cmd_some_short_bool`

These flags are set while normalizing the argument specification. The `obey_spaces` one is used to detect when ! is used on an argument that is not a trailing optional argument. The other two are used to check whether all short arguments appear before long arguments: this is needed to grab arguments expandably. As soon as the first long argument is seen (other than t-type, whose long status is ignored) the `some_long` flag is set. The `some_short` flag is used for expandable commands, to know whether to define a short auxiliary too.

```
45 \bool_new:N \l__cmd_some_obey_spaces_bool
46 \bool_new:N \l__cmd_some_long_bool
47 \bool_new:N \l__cmd_some_short_bool
```

`\l__cmd_final_verb_bool` Needed to establish whether optional arguments should be collected “verbatim safe”.

```
48 \bool_new:N \l__cmd_final_verb_bool
```

`\q__cmd_recursion_tail`
`__cmd_if_recursion_stop:nw`
`__cmd_use_i_delimit_by_q_recursion_stop:nw` Quarks and functions for internal processing.

```
49 \quark_new:N \q__cmd_recursion_tail
50 \quark_new:N \q__cmd_recursion_stop
51 \_\_kernel_quark_new_test:N \_\_cmd_if_recursion_tail_stop_do:Nn

(End of definition for \_\_cmd_if_recursion_tail_stop_do:Nn and
\_\_cmd_use_i_delimit_by_q_recursion_stop:nw.)
```

```
\l__cmd_tmp_prop
\l_\cmdtmpapt\ Scratch space.
\l__cmd_tmpb_tl
```

52 \prop_new:N \l__cmd_tmp_prop
53 \tl_new:N \l__cmd_tmpa_tl
54 \tl_new:N \l__cmd_tmpb_tl
55 \cs_new_eq:NN __cmd_tmp:w ?

(End of definition for __cmd_tmp:w.)

With `xparse`, information about commands being (re)defined was switched off by default, unless the `log-declarations` package option was used, so here we'll switch that off as well.

```
56 \msg_redirect_module:nnn { cmd } { info } { none }
Also add cmd to the LaTeX messages.
57 \prop_gput:Nnn \g_msg_module_type_prop { cmd } { LaTeX }
```

1.2 Declaring commands and environments

The main functions for creating commands set the appropriate flag then use the same internal code to do the definition.

```
58 \cs_new_protected:Npn \__cmd_declare_cmd:Nnn
59   {
60     \bool_set_false:N \l__cmd_expandable_bool
61     \__cmd_declare_cmd_aux:Nnn
62   }
63 \cs_new_protected:Npn \__cmd_declare_expandable_cmd:Nnn
64   {
65     \bool_set_true:N \l__cmd_expandable_bool
66     \__cmd_declare_cmd_aux:Nnn
67   }
```

The first stage is to log information, both for the user in the log and for programmatic use in a property list of all declared commands.

```
68 \cs_new_protected:Npn \__cmd_declare_cmd_aux:Nnn #1#2#3
69   {
70     \cs_if_exist:NTF #1
71       {
72         \msg_info:nnxx { cmd } { redefine }
73         { \token_to_str:N #1 } { \tl_to_str:n {#2} }
74       }
75       {
76         \bool_lazy_or:nnT
77           { \cs_if_exist_p:c { \cs_to_str:N #1 ~ code } }
78           { \cs_if_exist_p:c { \cs_to_str:N #1 ~ defaults } }
79         {
80           \msg_warning:nnx { cmd } { unsupported-let }
81           { \token_to_str:N #1 }
82         }
83         \msg_info:nnxx { cmd } { define-command }
84         { \token_to_str:N #1 } { \tl_to_str:n {#2} }
85       }
86     \bool_set_false:N \l__cmd_environment_bool
87     \__cmd_declare_cmd_internal:Nnnn #1 {#2} {#3} { }
```

```
88     }
```

At definition time, the variable `\l__cmd_fn_tl` is only used for error messages. The real business of defining a document command starts with setting up the appropriate name, then normalizing the argument specification to get rid of shorthands.

```
89 \cs_new_protected:Npn \__cmd_declare_cmd_internal:Nnnn #1#2#3#4
90 {
91     \tl_set:Nx \l__cmd_function_tl { \cs_to_str:N #1 }
92     \__cmd_normalize_arg_spec:n {#2}
93     \exp_args:No \__cmd_prepare_signature:n \l__cmd_arg_spec_tl
94     \__cmd_declare_cmd_code:Nnn #1 {#2} {#3}
95     #4
96     \__cmd_break_point:n {#2}
97 }
```

(End of definition for `__cmd_declare_cmd:Nnn` and others.)

`__cmd_break_point:n` A marker used to escape from creating a definition if necessary.

```
98 \cs_new_eq:NN \__cmd_break_point:n \use_none:n
```

(End of definition for `__cmd_break_point:n`.)

`__cmd_all_m_check:n` A quick loop to check for all (+)m-type arguments.

```
99 \cs_new:Npn \__cmd_all_m_check:n #1
100 { \tl_map_function:nN {#1} \__cmd_all_m_check_aux:n }
101 \cs_new:Npn \__cmd_all_m_check_aux:n #1
102 {
103     \str_if_eq:nnF {#1} { m }
104     {
105         \str_if_eq:nnF {#1} { + }
106         { X }
107     }
108 }
```

(End of definition for `__cmd_all_m_check:n` and `__cmd_all_m_check_aux:n`.)

At this stage we can check for a short-cut possibility: if the argument specification is made up of just (+)m tokens, and if all arguments are either short or long, then we can produce an optimized document command. This only applies to document commands, not creation of environments (which are more complex).

```
109 \cs_new_protected:Npn \__cmd_declare_cmd_code:Nnn #1#2
110 {
111     \bool_lazy_any:nTF
112     {
113         { \l__cmd_environment_bool }
114         {
115             \bool_lazy_and_p:nn
116             { \l__cmd_some_short_bool }
117             { \l__cmd_some_long_bool }
118         }
119         { ! \tl_if_blank_p:e { \__cmd_all_m_check:n {#2} } }
120     }
121     {
122         \tl_set:Nx \l__cmd_fn_tl
123         { \exp_not:c { \l__cmd_function_tl \c_space_tl } }
```

```

124         \bool_if:NTF \l__cmd_grab_expandably_bool
125             { \__cmd_declare_cmd_code_expandable:Nnn }
126             { \__cmd_declare_cmd_code_aux:Nnn }
127         }
128     { \__cmd_declare_cmd_optimized:Nnn }
129         #1 {#2}
130     }

```

The optimized version of commands just has to worry about whether to make them protected or long. The commands start with an expandable marker so that other parts of the kernel know these are set up by \tcmd. We need the two layers of redirection so that the `code` internal function has the same form as it would for any other document command. Optimization means that there is no `\group_align_safe_begin:` before grabbing the arguments, so anything involving & tokens will not work. However, this is really only intended for making optional argument processing safe anyway, so in practice should not be an issue.

```

131 \cs_new_protected:Npn \__cmd_declare_cmd_optimized:Nnn #1#2#3
132 {
133     \bool_if:NTF \l__cmd_expandable_bool
134         { \cs_set_nopar:Npe }
135         { \cs_set_protected_nopar:Npe }
136         #1
137         {
138             \exp_not:N \__cmd_start_optimized:
139             \exp_not:c { \l__cmd_function_tl \c_space_tl code }
140         }
141     \exp_args:Ncc \cs_generate_from_arg_count:NNnn
142         { \l__cmd_function_tl \c_space_tl code }
143         {
144             cs_set
145             \bool_if:NF \l__cmd_expandable_bool { _protected }
146             \bool_if:NF \l__cmd_some_long_bool { _nopar }
147             :Npn
148         }
149         \l__cmd_current_arg_int
150         {#3}
151     }
152 \cs_new:Npn \__cmd_start_optimized: { }

```

Standard functions call `__cmd_start:nNNnnn`, which receives the argument specification, an auxiliary used for grabbing arguments, an auxiliary containing the code, and then the signature, default arguments, and processors.

```

153 \cs_new_protected:Npn \__cmd_declare_cmd_code_aux:Nnn #1#2#3
154 {
155     \cs_generate_from_arg_count:cNnn
156         { \l__cmd_function_tl \c_space_tl code }

177        { \exp_not:o \l__cmd_process_all_tl }
178      }
179    }
180  }

```

Expandable functions and functions whose arguments can be grabbed expandably call `__cmd_start_expandable:nNNNNn`, which receives the argument specification, four auxiliaries (two for grabbing arguments, one for the code, and one for default arguments), and finally the signature. Non-expandable functions that take this branch should nevertheless be protected, as well as their `code` function. They will only be expanded in contexts such as constructing a `cname`. The two grabbers (named after the function with one or two spaces) are needed when there are both short and long arguments; otherwise the same grabber is included twice in the definition. If all arguments are long or all are short the (only) grabber is defined correspondingly to be long/short. Otherwise two grabbers are defined, one long, one short.

```

```

Creating a document environment requires a few more steps than creating a single command. In order to pass the arguments of the command to the end of the function, it is necessary to store the grabbed arguments. To do that, the function used at the end of the environment has to be redefined to contain the appropriate information. To minimize the amount of expansion at point of use, the code here is expanded now as well as when used. The last argument of `\l__cmd_declare_cmd_internal:Nnnn` is only run if the definition succeeded. In package mode this ensures that the original definition of the environment is not changed if the definition fails for any reason. This also avoids an error when defining the `end_aux` function when the user asks for more than 9 arguments.

```

264 \cs_new_protected:Npn \l__cmd_declare_env_internal:nnnn #1#2#3#4

```

(End of definition for `\l__cmd_declare_env:nnnn`, `\l__cmd_declare_env_internal:nnnn`, and `\l__cmd_set_environment_end:n`.)

1.3 Structure of xparse commands

```
\l__cmd_start_env:nnnnn
\l__cmd_start:nNNnnn
```

For error messages that occur during run-time when getting arguments of environments it is necessary to keep track of the environment name. We begin non-expandable commands with a token equal to `\scan_stop:`, whose name gives a reasonable error message if the command is used inside a csname and protects against f-expansion. This is useless for environments since `\begin` is already not expandable. Both the command and environment codes start with `\group_align_safe_begin:`, then `\l__cmd_run_code:` (used

by both) does `\group_align_safe_end`, so that delimited arguments may be grabbed in alignments if they contain and alignment tab token (see [latex3/latex3/issues/839](#)).

```

324     \conditionally@traceon
325     \exp_after:wN \l__cmd_fn_code_tl \l__cmd_args_tl
326 }
```

(End of definition for `_cmd_run_code`.)

```

\__cmd_defaults:
\__cmd_defaults_def:
\__cmd_defaults_def:nn
\__cmd_defaults_def:nnn
\__cmd_defaults_aux:
\__cmd_defaults_error:w

```

First construct `__cmd_tmp:w` (see below) that will receive the arguments found so far and determine default values for any missing argument. Then call it repeatedly until the set of arguments stabilizes. Since that could lead to an infinite loop we only call it up to nine times, the maximal number needed for stabilization if there is a chain of arguments that depend on each other. If that fails to stabilize raise an error.

```

327 \cs_new_protected:Npn \__cmd_defaults:
328 {
329     \__cmd_defaults_def:
330     \tl_set_eq:NN \l__cmd_args_i_tl \l__cmd_args_tl

398         }
399     }
400     \cs_new_protected:Npn \__cmd_args_process_aux:n #1
401     {
402         \cs_generate_from_arg_count:NNnn \__cmd_tmp:w \cs_set:Npn
403             { \tl_count:N \l__cmd_args_tl } {#1}
404         \exp_args:NNNo \exp_after:wN \__cmd_tmp:w \l__cmd_args_tl
405             { \ProcessedArgument }
406     }

```

(End of definition for `__cmd_args_process:`, `__cmd_args_process_loop:nn`, and `__cmd_args_process_aux:n`.)

`__cmd_start_expandable:nNNNNn`

This is called for all expandable commands. #6 is the signature, responsible for grabbing arguments. #5 is used to determine default values (or is ? if there are none). #4 is the code to run. #2 and #3 are functions (named after the command) that grab a single argument in the input stream (#3 is short). The argument specification #1 is only used by diagnostic functions. Same as for the non-expandable version, this starts with `\group_align_safe_begin:`, which expands to nothing, so may be safely used in an expandable context.

```

404 \cs_new:Npn \__cmd_start_expandable:nNNNNn #1#2#3#4#5#6
405   {
406     \group_align_safe_begin:
407     #6 \__cmd_end_expandable:NNw #5 #4 \q__cmd #2#3
408   }

```

(End of definition for `__cmd_start_expandable:nNNNNn`.)

```

\__cmd_end_expandable:NNw
\__cmd_end_expandable_aux:w
  \__cmd_end_expandable_aux:nNNNN
\__cmd_end_expandable_defaults:nnNNn
  \__cmd_end_expandable_defaults:nnw
    \__cmd_end_expandable_defaults:nw

```

Followed by a function #1 to determine default values (or ? if there are no defaults), the code #2, arguments that have been grabbed, then `\q__cmd` and two generic grabbers. The idea to find default values is similar to the non-expandable case but we cannot define an auxiliary function, so at every step in the loop we need to go through all arguments searching for which ones started out as `-NoValue-` and replacing these by the newly computed values. In fact we need to keep track of three versions of all arguments: the original version, the previous version with default values, and the currently built version (first argument of `__cmd_end_expandable_defaults:nnnNNn`).

```

```

1.4 Normalizing the argument specifications

The goal here is to expand aliases and check that the argument specification is valid before the main parsing run. If it is not valid the entire set up is abandoned to avoid any strange internal errors. A function is provided for each argument type that will grab any extra data items and call the loop function after performing the following checks and tasks.

- Check that each argument has the correct number of data items associated with it, and that where a single character is required, one has actually been supplied.
- Check that processors and the markers +, ! and = are followed by an argument for which they make sense, and are not redundant.
- Check the absence of forbidden types for expandable commands, namely G/v always, and 1/u after optional arguments (`xparse` may have inserted braces due to a failed search for an optional argument).
- Check that no optional argument is followed by a mandatory argument with the same delimiter, as otherwise the optional argument could never be omitted.
- Keep track in `\l__cmd_some_long_bool` and `\l__cmd_some_short_bool` of whether the command has some long/short arguments.
- Keep track in `\l__cmd_grab_expandably_bool` of whether all arguments are m/1/u type and short arguments appear before long ones, in which case they can be grabbed expandably just as safely as they could be grabbed nonexpandably. Regardless of that, arguments of expandable commands will be grabbed expandably and arguments of environments will not (because the list of arguments built by non-expandable grabbing is used to pass them to the end-environment code).

Further checks happen at the end of the loop:

- that there are at most 9 arguments;
- that an expandable command does not end with an optional argument (this case is detected by using the fact that `\l__cmd_last_delimiters_tl` is cleared by every mandatory argument and filled by every optional argument).

```
\__cmd_normalize_arg_spec:n Loop through the argument specification, calling an auxiliary specific to each argument
\__cmd_normalize_arg_spec_loop:n type. If any argument is unknown stop the definition.

`__cmd_normalize_type_D:w`
`__cmd_normalize_type_E:w`
`__cmd_normalize_type_t:w`
`__cmd_normalize_E_unique_check:w`

Optional argument types. Check that all required data is present (and consists of single characters if applicable) and check for forbidden types for expandable commands. For E-type require that there is at least one embellishment, that each one is a single character, and that there aren't more optional arguments than embellishments; also remember that each embellishment counts as one argument for `\l__cmd_current_arg_int`. Then in each case store the data in `\l__cmd_arg_spec_tl`, and for later checks store in `\l__cmd_last_delimiters_tl` the tokens whose presence determines whether there is an optional argument (for braces store {}, seen later as an empty delimiter).

`__cmd_allowed_token_check:N`

Some tokens are not allowed as delimiters for some argument types, notably implicit begin/end-group tokens (`\bgroup\egroup`). The major problem with these tokens is that for `\peek...` functions, a literal `{` is virtually indistinguishable from a `\bgroup` or other token which was `\let` to a `{`, and the same goes for `}`. All other tokens can be easily distinguished from their implicit counterparts by grabbing them and looking at the string length (see `__cmd_token_if_cs:NTF`), but for begin/end group tokens that is not possible without the risk of mistakenly grabbing the entire brace group (potentially leading to a ! Runaway argument error) or trying to grab a `}`, leading to an ! Argument of `\dots` has an extra `}` error.

```

(End of definition for `__cmd_add_arg_spec:n` and `__cmd_add_arg_spec_mandatory:n`.)

1.5 Preparing the signature: general mechanism

Actually creating the signature uses the same loop approach as normalizing the signature. There are first a number of variables which need to be set to track what is going on. Many of these variables are unused when defining expandable commands.

```

791 \cs_new_protected:Npn \__cmd_prepare_signature:n #1
792   {
793     \int_set_eq:NN \l__cmd_total_args_int \l__cmd_current_arg_int
794     \int_zero:N \l__cmd_current_arg_int
795     \bool_set_false:N \l__cmd_long_bool
796     \bool_set_false:N \l__cmd_obey_spaces_bool
797     \bool_set_false:N \l__cmd_suppress_strip_bool
798     \int_zero:N \l__cmd_m_args_int
799     \bool_set_false:N \l__cmd_defaults_bool
800     \tl_clear:N \l__cmd_defaults_tl

```

```

801   \tl_clear:N \l__cmd_process_all_tl
802   \tl_clear:N \l__cmd_process_one_tl
803   \bool_set_false:N \l__cmd_process_some_bool
804   \tl_clear:N \l__cmd_signature_tl
805   \__cmd_prepare_signature_verb_chk:n {#1}
806   \__cmd_prepare_signature:N #1 \q_recursion_tail \q_recursion_stop
807   \bool_if:NF \l__cmd_expandable_bool { \__cmd_flush_m_args: }
808 }

```

A quick check on the final arg. type.

```

809 \cs_new_protected:Npn \__cmd_prepare_signature_verb_chk:n #1
810 {
811   \str_if_eq:eeTF { \tl_head:e { \tl_reverse:n {#1} } } { c }
812   { \bool_set_true:N \l__cmd_final_verb_bool }
813   { \bool_set_false:N \l__cmd_final_verb_bool }
814 }

```

The main looping function does not take an argument, but carries out the reset on the processor boolean. This is split off from the rest of the process so that when actually setting up processors the flag-reset can be bypassed.

For each known argument type there is an appropriate function to actually do the addition to the signature. These are separate for expandable and standard functions, as the approaches are different.

```

815 \cs_new_protected:Npn \__cmd_prepare_signature:N
816 {
817   \bool_set_false:N \l__cmd_prefixed_bool
818   \__cmd_prepare_signature_bypass:N
819 }
820 \cs_new_protected:Npn \__cmd_prepare_signature_bypass:N #1
821 {
822   \quark_if_recursion_tail_stop:N #1
823   \use:c
824   {
825     \__cmd_add
826     \bool_if:NT \l__cmd_grab_expandably_bool { _expandable }
827     _type_ \token_to_str:N #1 :w
828   }
829 }

```

(End of definition for `__cmd_prepare_signature:n` and others.)

1.6 Setting up a standard signature

Each argument-adding function appends to the signature a grabber (and for some types, the delimiters or default value), except the one for `m` arguments. These are collected and added to the signature all at once by `__cmd_flush_m_args:`, called for every other argument type. All of the functions then call the loop function `__cmd_prepare_signature:N`. Default values of arguments are collected by `__cmd_add_default:n` rather than being stored with the argument; this function and `__cmd_add_default:` are also responsible for keeping track of `\l__cmd_current_arg_int`.

`__cmd_add_type_+:+w` Making the next argument long means setting the flag. The `m` arguments are recorded here as this has to be done for every case where there is then a long argument.

```
830 \cs_new_protected:cpx \__cmd_add_type_+:+w }
```

```

831  {
832    \_\_cmd\_flush\_m\_args:
833    \bool\_set\_true:N \l\_\_cmd\_long\_bool
834    \bool\_set\_true:N \l\_\_cmd\_prefixed\_bool
835    \_\_cmd\_prepare\_signature\_bypass:N
836  }

```

(End of definition for __cmd_add_type_+:\w.)

__cmd_add_type_!:\w Much the same for controlling trailing optional arguments.

```

837 \cs\_new\_protected:cpn { \_\_cmd\_add\_type\_!:\w }
838  {
839    \_\_cmd\_flush\_m\_args:
840    \bool\_set\_true:N \l\_\_cmd\_obey\_spaces\_bool
841    \bool\_set\_true:N \l\_\_cmd\_prefixed\_bool
842    \_\_cmd\_prepare\_signature\_bypass:N
843  }

```

(End of definition for __cmd_add_type_!:\w.)

__cmd_add_type_>:\w When a processor is found, the processor code is stored. It will be used by __cmd_args_process: once arguments are all found. Here too the loop calls __cmd_prepare_signature_bypass:N rather than __cmd_prepare_signature:N so that the flag is not reset.

```

844 \cs\_new\_protected:cpn { \_\_cmd\_add\_type\_>:\w } #1
845  {
846    \_\_cmd\_flush\_m\_args:
847    \bool\_set\_true:N \l\_\_cmd\_prefixed\_bool
848    \bool\_set\_true:N \l\_\_cmd\_process\_some\_bool

```

(End of definition for __cmd_add_type_D:w.)

__cmd_add_type_E:w The E-type argument needs a special handling of default values. Since each embellishment is a separate argument, it also needs to replicate the argument processors for each embellishment argument so that the numbers of arguments and processors remain in sync.

```

881 \cs_new_protected:Npn \_\_cmd\_add\_type\_E:w #1#2
882  {
883    \_\_cmd\_flush\_m\_args:
884    \_\_cmd\_add\_default_E:nn {#1} {#2}
885    \use:x
886    {
887      \_\_cmd\_replicate_processor:nn { \tl_count:n {#1} }
888      { \exp_not:o \l_\_cmd\_process\_one\_tl }
889    }
890    \_\_cmd\_add\_grabber:N E
891    \tl_put_right:Nn \l_\_cmd\_signature_tl { {#1} }
892    \_\_cmd\_prepare\_signature:N
893  }

```

(End of definition for __cmd_add_type_E:w.)

__cmd_replicate_processor:nn In the command's argument processor signature (the final argument of __cmd_start:nNNnn) there is one braced item for each formal argument (up to nine), and in each of these items there is one braced item for each processor (as many as there were processors declared for a given argument). Something like this:

```

{ % argument processors
  { % argument 1
    { processor 1 } { processor 2 } ... { processor n }
  } % end argument 1
  { ... } % argument 2
  :

```

```

{ ... } % argument n
} % end argument processors

```

The function `__cmd_add_grabber:N` adds one single grabber for an argument, and adds the braced item for that one argument. However, in an E-type argument each embellishment requires its own formal argument, so we need to break out of one layer of braces in `\l__cmd_process_one_tl`, add copies of the processor as necessary, and then return the removed brace. The function below does just that: it defines `\l__cmd_process_one_tl` starting with a `}2` and ending with a `{1`, so that it adds as many processors as needed when x-expanded.

```

894 \cs_new_protected:Npn \__cmd_replicate_processor:nn #1 #2
895   {
896     \int_compare:nNnF {#1} > { 1 } { \use_none:nnn }
897     \tl_set:Nx \l__cmd_process_one_tl
898     {
899       \exp_not:n { \exp_not:n {#2} \if_false: { \fi: } }
900       \prg_replicate:nn { #1 - 2 }
901       { \exp_not:n { \exp_not:n { {#2} } } }
902       \exp_not:n { { \if_false: } \fi: \exp_not:n {#2} }
903     }
904   }

```

(End of definition for `__cmd_replicate_processor:nn`.)

`__cmd_add_type_m:w` The `m` type is special as short arguments which are not post-processed are simply counted at this stage. Thus there is a check to see if either of these cases apply. If so, a one-argument grabber is added to the signature. On the other hand, if a standard short argument is required it is simply counted at this stage, to be added later using `__cmd_flush_m_args:`.

```

905 \cs_new_protected:Npn \__cmd_add_type_m:w
906   {
907     \__cmd_add_default:
908     \bool_if:NTF \l__cmd_prefixed_bool
909     { \__cmd_add_grabber:N m }
910     { \int_incr:N \l__cmd_m_args_int }
911     \__cmd_prepare_signature:N
912   }

```

(End of definition for `__cmd_add_type_m:w`.)

`__cmd_add_type_R:w` The R-type argument is very similar to the D-type.

```

913 \cs_new_protected:Npn \__cmd_add_type_R:w #1#2#3
914   {
915     \__cmd_flush_m_args:
916     \__cmd_add_default:n {#3}
917     \__cmd_add_grabber:N R
918     \tl_put_right:Nn \l__cmd_signature_tl { #1 #2 }
919     \__cmd_prepare_signature:N
920   }

```

(End of definition for `__cmd_add_type_R:w`.)

`__cmd_add_type_t:w` Setting up a `t` argument means collecting one token for the test, and adding it along with the grabber to the signature.

```
921 \cs_new_protected:Npn \_\_cmd\_add\_type_t:w #1
922   {
923     \_\_cmd\_flush_m\_args:
924     \_\_cmd\_add\_default:
925     \_\_cmd\_add\_grabber:N t
926     \tl_put_right:Nn \l_\_\_cmd\_signature_tl {\#1}
927     \_\_cmd\_prepare\_signature:N
928   }
```

(End of definition for `__cmd_add_type_t:w`.)

`__cmd_add_type_v:w` At this stage, the `v` argument is identical to `l` except that since the grabber may fail to read a verbatim argument we need a default value.

```
929 \cs_new_protected:Npn \_\_cmd\_add\_type_v:w
930   {
931     \_\_cmd\_flush_m\_args:
932     \exp_args:No \_\_cmd\_add\_default:n \c_novalue_tl
933     \_\_cmd\_add\_grabber:N v
934     \_\_cmd\_prepare\_signature:N
935   }
```

(End of definition for `__cmd_add_type_v:w`.)

`__cmd_flush_m_args:` As `m` arguments are simply counted, there is a need to add them to the token register in a block. As this function can only be called if something other than `m` turns up, the flag can be switched here.

```
936 \cs_new_protected:Npn \_\_cmd\_flush_m\_args:
937   {
938     \int_compare:nNnT \l_\_\_cmd_m\_args_int > 0
939     {
940       \tl_put_right:Nx \l_\_\_cmd\_signature_tl
941       { \exp_not:c { \_\_cmd_grab_m_ \int_use:N \l_\_\_cmd_m\_args_int :w } }
942       \tl_put_right:Nx \l_\_\_cmd_process_all_tl
943       { \prg_replicate:nn { \l_\_\_cmd_m\_args_int } { { } } }
944     }
945     \int_zero:N \l_\_\_cmd_m\_args_int
946   }
```

(End of definition for `__cmd_flush_m_args`.)

`__cmd_add_grabber:N` To keep the various checks needed in one place, adding the grabber to the signature is done here. The only questions are whether the grabber should be long or not, and whether to obey spaces. The `\l___cmd_obey_spaces_bool` boolean can only be `true` for trailing optional arguments. In that case spaces will not be ignored when looking for that optional argument.

```
947 \cs_new_protected:Npn \_\_cmd\_add\_grabber:N #1
948   {
949     \tl_put_right:Nx \l_\_\_cmd\_signature_tl
950     {
951       \exp_not:c
952       {
953         \_\_cmd_grab_ #1
```

```

954         \bool_if:NT \l__cmd_long_bool { _long }
955         \bool_if:NT \l__cmd_obey_spaces_bool { _obey_spaces }
956         \bool_lazy_and:nnT
957             { \l__cmd_suppress_strip_bool }
958             { \str_if_eq_p:nn {#1} { D } }
959             { _no_strip }
960         \bool_lazy_all:nT
961             {
962                 { \l__cmd_final_verb_bool }
963                 { \str_if_eq_p:nn {#1} { D } }
964                 {
965                     \int_compare_p:nNn \l__cmd_current_arg_int
966                     = { \l__cmd_total_args_int - 1 }
967                 }
968             }
969             { _verb_safe }
970         :w
971     }
972 }
973 \bool_set_false:N \l__cmd_long_bool
974 \bool_set_false:N \l__cmd_obey_spaces_bool
975 \bool_set_false:N \l__cmd_suppress_strip_bool
976 \bool_set_false:N \l__cmd_verb_safe_bool
977 \tl_put_right:Nx \l__cmd_process_all_tl
978     {
979         {
980             \if_charcode:w E #1 \use_i:nn \fi:
981             \exp_not:o \l__cmd_process_one_tl
982         }
983     }
984 \tl_clear:N \l__cmd_process_one_tl
985 }
```

(End of definition for `__cmd_add_grabber:N`.)

`__cmd_add_default:n` Store the default value of an argument, or rather code that gives that default value (it may involve other arguments). This is `\c_novalue_tl` for arguments with no actual default or with default `-NoValue-`; and (in a brace group) `\prg_do_nothing:` followed by a default value for others. For `E`-type arguments, pad the defaults `#2` with some `\c_novalue_tl` until there are as many as embellishments `#1`. These functions are also used when defining expandable commands.

```

986 \cs_new_protected:Npn \__cmd_add_default:n #1
987     {
988         \tl_if_novalue:nTF {#1}
989             { \__cmd_add_default: }
990             {
991                 \int_incr:N \l__cmd_current_arg_int
992                 \bool_set_true:N \l__cmd_defaults_bool
993                 \tl_put_right:Nn \l__cmd_defaults_tl { { \prg_do_nothing: #1 } }
994             }
995     }
996 \cs_new_protected:Npn \__cmd_add_default:
997     {
998         \int_incr:N \l__cmd_current_arg_int
```

```

999      \tl_put_right:Nn \l__cmd_defaults_tl { \c_novalue_tl }
1000    }
1001 \cs_new_protected:Npn \__cmd_add_default_E:nn #1#2
1002  {
1003    \tl_map_function:nN {#2} \__cmd_add_default:n
1004    \prg_replicate:nn
1005      { \tl_count:n {#1} - \tl_count:n {#2} }
1006      { \__cmd_add_default: }
1007  }

```

(End of definition for `__cmd_add_default:n`, `__cmd_add_default:`, and `__cmd_add_default_E:nn`.)

1.7 Setting up expandable types

The approach here is not dissimilar to that for standard types, but fewer types are supported. There is also a need to define the per-function auxiliaries: this is done here, while the general grabbers are dealt with later.

`__cmd_add_expandable_type_+:w`

We have already checked that short arguments are before long arguments, so `\l__cmd_long_bool` only changes from `false` to `true` once (and there is no need to reset it after each argument). Continue the loop.

```

1008 \cs_new_protected:cpn { __cmd_add_expandable_type_+:w }
1009  {
1010    \bool_set_true:N \l__cmd_long_bool
1011    \__cmd_prepare_signature:N
1012  }

```

(End of definition for `__cmd_add_expandable_type_+:w`.)

`__cmd_add_expandable_type_D:w`
`__cmd_add_expandable_type_D_aux:NNNn`
`__cmd_add_expandable_type_D_aux:NNN`
`__cmd_add_expandable_type_D_aux>NN`

The set up for D-type arguments involves constructing a rather complex auxiliary which is used repeatedly when grabbing. There is an auxiliary here so that the R-type can share code readily: #1 is D or R. The `_aux:NN` auxiliary is needed if the two delimiting tokens are identical: in contrast to the non-expandable route, the grabber here has to act differently for this case.

```

1013 \cs_new_protected:Npn \__cmd_add_expandable_type_D:w
1014  { \__cmd_add_expandable_type_D_aux:NNNn D }
1015 \cs_new_protected:Npn \__cmd_add_expandable_type_D_aux:NNNn #1#2#3#4
1016  {
1017    \__cmd_add_default:n {#4}
1018    \tl_if_eq:nnTF {#2} {#3}
1019      { \__cmd_add_expandable_type_D_aux:NN #1 #2 }
1020      { \__cmd_add_expandable_type_D_aux:NNN #1 #2 #3 }
1021    \__cmd_prepare_signature:N
1022  }
1023 \cs_new_protected:Npn \__cmd_add_expandable_type_D_aux:NNN #1#2#3
1024  {
1025    \bool_if:NTF \l__cmd_long_bool
1026      { \cs_set:cpx }
1027      { \cs_set_nopar:cpx }
1028      { \l__cmd_expandable_aux_name_tl } ##1 ##2 #2 ##3 \q__cmd ##4 #3
1029      { ##1 {##2} {##3} {##4} }
1030    \__cmd_add_expandable_grabber:nn {#1}
1031    {
1032      \exp_not:c { \l__cmd_expandable_aux_name_tl }

```

```

1033         \exp_not:n { #2 #3 }
1034     }
1035   }
1036 \cs_new_protected:Npn \__cmd_add_expandable_type_D_aux:NN #1#2
1037   {
1038     \bool_if:NTF \l__cmd_long_bool
1039     { \cs_set:cpx }
1040     { \cs_set_nopar:cpx }
1041     { \l__cmd_expandable_aux_name_tl } ##1 #2 ##2 #2
1042     { ##1 {##2} }
1043     \__cmd_add_expandable_grabber:nn { #1_alt }
1044     {
1045       \exp_not:c { \l__cmd_expandable_aux_name_tl }
1046       \exp_not:n {#2}
1047     }
1048   }

```

(End of definition for `__cmd_add_expandable_type_D:w` and others.)

`__cmd_add_expandable_type_E:w`
`__cmd_add_expandable_type_E_aux:n`

For each embellishment, use `__cmd_get_grabber:NN` to obtain an auxiliary delimited by that token and store a pair constituted of the auxiliary and the token in `\l__cmd_tmpb_tl`, before appending the whole set of these pairs to the signature, and an equal number of -NoValue- markers (regardless of the default values of arguments). Set the current argument appropriately.

```

1049 \cs_new_protected:Npn \__cmd_add_expandable_type_E:w #1#2
1050   {
1051     \__cmd_add_default_E:nn {#1} {#2}
1052     \tl_clear:N \l__cmd_tmpb_tl
1053     \tl_map_function:nN {#1} \__cmd_add_expandable_type_E_aux:n
1054     \__cmd_add_expandable_grabber:nn
1055     { E \bool_if:NT \l__cmd_long_bool { _long } }
1056     {
1057       { \exp_not:o \l__cmd_tmpb_tl }
1058       {
1059         \prg_replicate:nn { \tl_count:n {#1} }
1060         { { \c_novalue_tl } }
1061       }
1062     }
1063     \__cmd_prepare_signature:N
1064   }
1065 \cs_new_protected:Npn \__cmd_add_expandable_type_E_aux:n #1
1066   {
1067     \__cmd_get_grabber:NN #1 \l__cmd_tmpa_tl
1068     \tl_put_right:Nx \l__cmd_tmpb_tl
1069     { \exp_not:o \l__cmd_tmpa_tl \exp_not:N #1 }
1070   }

```

(End of definition for `__cmd_add_expandable_type_E:w` and `__cmd_add_expandable_type_E_aux:n`.)

`__cmd_add_expandable_type_m:w`

Unlike the standard case, when working expandably each argument is always grabbed separately.

```

1071 \cs_new_protected:Npn \__cmd_add_expandable_type_m:w
1072   {
1073     \__cmd_add_default:

```

```

1074     \__cmd_add_expandable_grabber:nn
1075     { m \bool_if:NT \l__cmd_long_bool { _long } } { }
1076     \__cmd_prepare_signature:N
1077 }
```

(End of definition for `__cmd_add_expandable_type_m:w`.)

`__cmd_add_expandable_type_R:w` The R-type is very similar to the D-type argument, and so the same internals are used.

```

1078 \cs_new_protected:Npn \__cmd_add_expandable_type_R:w
1079 { \__cmd_add_expandable_type_D_aux:NNNn R }
```

(End of definition for `__cmd_add_expandable_type_R:w`.)

`__cmd_add_expandable_type_t:w` An auxiliary delimited by #1 is built now. It will be used to test for the presence of that token.

```

1080 \cs_new_protected:Npn \__cmd_add_expandable_type_t:w #1
1081 {
1082     \__cmd_add_default:
1083     \__cmd_get_grabber:NN #1 \l__cmd_tmpa_tl
1084     \__cmd_add_expandable_grabber:nn { t }
1085     {
1086         \exp_not:o \l__cmd_tmpa_tl
1087         \exp_not:N #1
1088     }
1089     \__cmd_prepare_signature:N
1090 }
```

(End of definition for `__cmd_add_expandable_type_t:w`.)

`__cmd_add_expandable_grabber:nn` This is called for all arguments to place the right grabber in the signature.

```

1091 \cs_new_protected:Npn \__cmd_add_expandable_grabber:nn #1#2
1092 {
1093     \tl_put_right:Nx \l__cmd_signature_tl
1094     { \exp_not:c { __cmd_expandable_grab_ #1 :w } #2 }
1095 }
```

(End of definition for `__cmd_add_expandable_grabber:nn`.)

`__cmd_get_grabber>NN` Given a token #1, defines an expandable function delimited by that token and stores it in the token list #2. The function is named after the token, unless that function name is already taken by some other grabber (this can happen in the rare case where delimiters with different category codes are used in the same document): in that case use a global counter to get a unique name. Since the grabbers are not named after `xparse` commands they should not be used to get material from the input stream.

```

1096 \cs_new_protected:Npn \__cmd_get_grabber>NN #1#2
1097 {
1098     \cs_set:Npn \__cmd_tmp:w ##1 #1 {##1}
1099     \exp_args:Nc \__cmd_get_grabber_auxi:NN
1100     { __cmd_grabber_ \token_to_str:N #1 :w } #2
1101 }
1102 \cs_new_protected:Npn \__cmd_get_grabber_auxi:NN #1#2
1103 {
1104     \cs_if_eq:NNTF \__cmd_tmp:w #1
1105     { \tl_set:Nn #2 {##1} }
```

```

1106    {
1107        \cs_if_exist:NTF #1
1108        {
1109            \int_gincr:N \g__cmd_grabber_int
1110            \exp_args:Nc \__cmd_get_grabber_auxi:NN

1.7.1 Copying a command and its internal structure

```

1125 <latexrelease>\IncludeInRelease{2021/11/15}{\__cmd_copy:NN}%
1126 <latexrelease> {Support~\NewCommandCopy-in-ltcmd}

```

Since the 2020-10-01 L^AT_EX 2 _{ε} release, support for copying, and showing the definition of, robust commands has been available, but the specifics of each command are implemented separately. Here we'll add support for copying and showing `ltcmd` definitions.

To fully support copying, we need two commands: a conditional to test if a command is in fact a `ltcmd` command, and another command to actually copy the command. The conditional is defined later as `__kernel_cmd_if_xparse:NTF`, so now to the copying: This macro just branches to the proper copying command by using `__cmd_cmd_type_cases:NnnnnnF`. The copying command takes the names of the commands to be copied to and from, and the actual commands as its four arguments.

```

1127 \cs_new_protected:Npn \__cmd_copy:NN #1 #2
1128 {
1129     \use:x
1130     {
1131         \int_set:Nn \tex_escapechar:D { 92 }
1132         \exp_not:N \__cmd_cmd_type_cases:NnnnnnF \exp_not:N #2
1133         { \__cmd_copy_command:nN }*
1134         { \__cmd_copy_expandable:nN }*
1135         { \__cmd_copy_optimized:nN }*
1136         { \__cmd_copy_environment:nN }*
1137         { \__cmd_copy_environment_end:nN }*
1138         { \__cmd_cant_copy:nw { non-ltcmd } }*
1139         { \cs_to_str:N #1 } { \cs_to_str:N #2 }
1140         \exp_not:N #1 \exp_not:N #2
1141         \exp_not:N \__cmd_break_point:n { \cs_to_str:N #2 }
1142         \int_set:Nn \tex_escapechar:D { \int_use:N \tex_escapechar:D }

```

```

1143         }
1144     }
1145 \cs_new_protected:Npn \__cmd_set_eq_if_exist:NN #1 #2
1146   { \cs_if_exist:NTF #2 { \cs_set_eq:NN } { \use_none:nn } #1 #2 }
1147 \cs_generate_variant:Nn \__cmd_set_eq_if_exist:NN { cc }

```

An utility macro similar to `__cmd_bad_def:wn` to abort a command copy. Contrary to `__cmd_bad_def:wn` though, when this happens the issue is most likely internal, because the command was already (supposedly) correctly defined so it should be copyable. Hopefully this macro will never be used ever, but if it does, apologise and give the reason for the failure so the user can report.

```

1148 \cs_new_protected:Npn \__cmd_cant_copy:nwn #1 #2 \__cmd_break_point:n #3
1149   { \msg_error:nnnn { cmd } { copy-bug } {#1} {#3} }
1150 \msg_new:nnn { cmd } { copy-bug }
1151   {
1152     Error~while~copying~command~\iow_char:N\#2:\\
1153     \str_case:nn {#1}
1154     {
1155       { non-ltcmd } { Command~is~not~a~valid~ltcmd~command. }
1156       { unknown-type } { Found~an~unknown~argument~type. }
1157       { invalid-end } { Target~command~is~not~named~\iow_char:N \\end<name>. }
1158     }
1159   }
1160 }

```

And, of course, add `__kernel_cmd_if_xparse:NTF` and `__cmd_copy:NN` to `\@declarecommandcopylisthook`:

```

1161 \tl_gput_right:Nn \@declarecommandcopylisthook
1162   { { \__kernel_cmd_if_xparse:NTF \__cmd_copy:NN } }

```

(End of definition for `__cmd_copy:NN`, `__cmd_set_eq_if_exist:NN`, and `__cmd_cant_copy:nwn`.)

`__cmd_copy_command:nnNN` and `__cmd_copy_command:NnNNnnnn`

A normal (non-expandable) command has a pretty straightforward structure. Its definition is stored in `\⟨cmd⟩_code`, its defaults (if any) are stored in `\⟨cmd⟩_defaults`, and its top-level definition contains its signature, which can just be copied over. `__cmd_copy_command:nnNN` copies the command code and defaults, and then defines the top-level command using the auxiliary `__cmd_copy_command:NnNNnnnn`. This macro takes the signature of the command being copied from its top-level definition, and replaces the named bits with the new name.

```

1163 \cs_new_protected:Npn \__cmd_copy_command:nnNN #1 #2 #3 #4
1164   {
1165     \cs_set_eq:cc { #1 ~ code } { #2 ~ code }
1166     \__cmd_set_eq_if_exist:cc { #1 ~ defaults } { #2 ~ defaults }
1167     \cs_set_protected_nopar:Npx #3
1168     { \exp_after:wN \__cmd_copy_command:NnNNnnnn #4 {#1} }
1169   }
1170 \cs_new:Npn \__cmd_copy_command:NnNNnnnn #1 #2 #3 #4 #5 #6 #7 #8
1171   {
1172     #1 \exp_not:n { {#2} }
1173     \exp_not:c { #8 ~ } \exp_not:c { #8 ~ code }
1174     \exp_not:n { {#5} {#6} {#7} }
1175   }

```

(End of definition for `__cmd_copy_command:nnNN` and `__cmd_copy_command:NnNNnnnn`.)

```
\__cmd_copy_expandable:nnNN  
 \__cmd_copy_expandable:NnNNNNnnn
```

An expandable command is slightly more complicated. Besides the `\⟨cmd⟩_code`, and `\⟨cmd⟩_defaults`, it also has an auxiliary `\⟨cmd⟩_l` for grabbing delimited arguments, and possibly another auxiliary `\⟨cmd⟩_ll`, if the command has both long and short arguments. Then, its signature also has several specific bits that are unique to that command; this is in contrast to non-expandable commands, which use a common set of parsing functions.

We start by copying the basics, then call `__cmd_copy_expandable_signature:NnNNNNnnn` to parse the signature of the command and build up the modified copy in a temporary token list, then we call `__cmd_copy_expandable:NnNNNNnnn` that will copy the top-level definition of the command, with the proper internal renames.

```
1176 <texrelease> \EndIncludeInRelease  
1177 <texrelease> \IncludeInRelease{2020/10/01}{\__cmd_copy:NN} %  
1178 <texrelease> {Support~\NewCommandCopy~in~ltcmd}  
1179 <texrelease> \EndIncludeInRelease
```

There's one variant: a command begins with `__cmd_start_expandable:nNNNNn` may still be un-expandable/protected if it's defined by `\NewDocumentCommand` and friends, with empty or only m-type arguments.

```
1180 <texrelease> \IncludeInRelease{2023/06/01}{\__cmd_copy_expandable:nnNN} %

A signature for an expandable command contains as many `\expandable_grab_<type>:w` as there are arguments, and what follows this macro depends on the `<type>`. We'll start a loop through the signature, and at each argument grabber, we'll step the argument count, and look for the `<type>` with `__cmd_copy_parse_grabber:w` so that we know which `__cmd_copy_grabber_<type>:w` to call next.

```

1242 \cs_new_protected:Npn \__cmd_copy_expandable_signature:NnNNNnnn
1243   #1 #2 #3 #4 #5 #6 #7 #8 #9
1244   {

1259       \tl_to_str:n { expandable_grab_ } ##2 \tl_to_str:n { :w }

```

```

1260      {
1261          \tl_put_right:Nx \exp_not:N \l__cmd_tmpa_tl
1262          { \exp_not:N \exp_not:c { __cmd_expandable_grab_##2:w } }
1263          \exp_not:N \cs_if_exist_use:cF { __cmd_copy_grabber_##2:w }
1264          { \__cmd_cant_copy:nwn { unknown-type } }
1265      }
1266  }

```

The most complicated is the Delimited argument: each argument has a dedicated grabbing function named after the command that has to be copied over (of the form $\langle cmd \rangle \cup (\arg \cup (num))$).

```

1267 \cs_new_protected:Npn \__cmd_copy_grabber_D:w #1 #2 #3 #4 #5
1268  {
1269      \tl_put_right:Nx \l__cmd_tmpa_tl
1270      {
1271          \exp_not:c { #1 ~ (arg ~ \int_use:N \l__cmd_current_arg_int ) }
1272          \exp_not:n { #4 #5 }
1273      }
1274      \cs_set_eq:cc
1275          { #1 ~ (arg ~ \int_use:N \l__cmd_current_arg_int ) }
1276          { #2 ~ (arg ~ \int_use:N \l__cmd_current_arg_int ) }
1277          \__cmd_copy_expandable:nnN {#1} {#2}
1278  }

```

`D_alt` is just a special case of `D` that uses a single delimiter (used when both delimiters of the argument are identical):

```

1279 \cs_new_protected:Npn \__cmd_copy_grabber_D_alt:w #1 #2 #3 #4
1280  { \__cmd_copy_grabber_D:w {#1} {#2} {#3} {#4} { } }

```

As far as copying is concerned, `R` is identical to `D`:

```

1281 \cs_new_eq:NN \__cmd_copy_grabber_R:w \__cmd_copy_grabber_D:w
1282 \cs_new_eq:NN \__cmd_copy_grabber_R_alt:w \__cmd_copy_grabber_D_alt:w

```

`E` is straightforward: we just copy the embellishments over, and increase the current argument number `\l__cmd_current_arg_int` by the number of embellishments (minus one because there is a `\int_incr:N` down the line).

```

1283 \cs_new_protected:Npn \__cmd_copy_grabber_E:w #1 #2 #3 #4
1284  {
1285      \tl_put_right:Nn \l__cmd_tmpa_tl { {#3} {#4} }
1286      \int_add:Nn \l__cmd_current_arg_int { \tl_count:n {#4} - 1 }
1287      \__cmd_copy_expandable:nnN {#1} {#2}
1288  }
1289 \cs_new_eq:NN \__cmd_copy_grabber_E_long:w \__cmd_copy_grabber_E:w
    t just needs copying the token to be tested for:
1290 \cs_new_protected:Npn \__cmd_copy_grabber_t:w #1 #2 #3 #4
1291  {
1292      \tl_put_right:Nn \l__cmd_tmpa_tl { #3 #4 }
1293      \__cmd_copy_expandable:nnN {#1} {#2}
1294  }

```

And last but not least, `m` is the simplest; the grabber is just `__cmd_expandable_grab_m:w`, which is already added to the new command so here we just resume the loop:

```

1295 \cs_new_protected:Npn \__cmd_copy_grabber_m:w { \__cmd_copy_expandable:nnN }
1296 \cs_new_eq:NN \__cmd_copy_grabber_m_long:w \__cmd_copy_grabber_m:w

```

(End of definition for `__cmd_copy_expandable:nnNN` and others.)

Copying an environment's `\begin` part is pretty much like copying a command, except it has a longer name, and at the end we have to copy `\environment {name}` into `\{name`.

```
1297 \cs_new_protected:Npn \__cmd_copy_environment:nnNN #1 #2 #3 #4
1298 {
1299   \cs_set_eq:cc { environment~ #1 ~ code } { environment~ #2 ~ code }
1300   \__cmd_set_eq_if_exist:cc
1301   { environment~ #1 ~ defaults } { environment~ #2 ~ defaults }
1302   \cs_set_protected_nopar:cpx { environment~ #1 }
1303   { \exp_after:wN \__cmd_copy_environment:Nnnnnnn #4 {#1} }
1304   \cs_set_eq:cc {#1} { environment~ #1 }
1305 }
1306 \cs_new:Npn \__cmd_copy_environment:Nnnnnnn #1 #2 #3 #4 #5 #6 #7
1307 { #1 \exp_not:n { {#2} } {#7} \exp_not:n { {#4} {#5} {#6} } }
```

(End of definition for `__cmd_copy_environment:nnNN` and `__cmd_copy_environment:Nnnnnnn`.)

Copying an environment's `\end` part is a bit trickier. We first have to make sure that both parts are named `\end{name}` (that's actually not a hard requirement, but an environment `\end` command makes no sense without the `end` in its name), and strip the leading `end` from the strings. After that, copying is straightforward.

```
1308 \cs_new_protected:Npn \__cmd_copy_environment_end:nnNN #1 #2
1309 {
1310   \__cmd_check_end:Nn \l__cmd_tmpa_tl {#1}
1311   \__cmd_check_end:Nn \l__cmd_tmpb_tl {#2}
1312   \exp_args:Nno \__cmd_copy_environment_end_aux:nnNN
1313   { \l__cmd_tmpa_tl } { \l__cmd_tmpb_tl }
1314 }
1315 \cs_new_protected:Npn \__cmd_copy_environment_end_aux:nnNN #1 #2 #3 #4
1316 {
1317   \cs_set_nopar:cpx { environment~ #1 ~end }
1318   { \exp_not:c { environment~ #1 ~end~aux } }
1319   \cs_set_eq:cc
1320   { environment~ #1 ~end~aux~ } { environment~ #2 ~end~aux~ }
1321   \cs_set_eq:cc { end #1 } { environment~ #1 ~end }
1322 }
```

To check whether an `\end` command is valid, we look for the string `end` at the beginning of the command name, and if not found, raise an error:

```
1323 \cs_new_protected:Npn \__cmd_check_end:Nn #1 #2
1324 {
1325   \tl_set:Nx #1 { \__cmd_check_end:n {#2} }
1326   \token_if_eq_meaning:NNT #1 \q_nil
1327   { \__cmd_cant_copy:nwn { invalid-end } }
1328 }
1329 \cs_set_protected:Npn \__cmd_tmp:w #
1330 {
1331   \cs_new:Npn \__cmd_check_end:n ##1
1332   {
1333     \exp_after:wN \__cmd_check_end:w \tl_to_str:n {##1}
1334     #1 \q_mark #1 \q_stop
1335   }
1336 \cs_new:Npn \__cmd_check_end:w ##1 #1 ##2 #1 ##3 \q_stop
```

```

1337      { \if_meaning:w ##2 \q_mark \exp_not:N \q_nil \else: ##2 \fi: }
1338    }
1339 \exp_args:No \__cmd_tmp:w { \tl_to_str:n { end } }

```

(End of definition for `__cmd_copy_environment_end:nnNN` and others.)

Not much to do regarding `\texrelease`: we could remove the entries from `\@declarecommandcopylist` but it doesn't seem worth it.

```

1340 \texrelease\EndIncludeInRelease
1341 \texrelease\IncludeInRelease{2020/10/01}{\__cmd_copy:NN (part 2)}%
1342 \texrelease\{Support~\NewCommandCopy~in~\ltcmd}
1343 \texrelease\EndIncludeInRelease

```

1.7.2 Showing the definition of a command

```

1344 \texrelease\IncludeInRelease{2021/11/15}{\__cmd_show:N}%
1345 \texrelease\{Support~\ShowCommand~in~\ltcmd}

```

To show the definition of a command we need more or less the same building blocks as for copying, except that instead of making a copy, we'll just print stuff to the terminal. This macro just branches to the proper showing command by using `__cmd_cmd_type_cases:NnnnnnF`. The showing command takes the command to be shown as argument.

```

1346 \cs_new_protected:Npn \__cmd_show:N #1
1347 {
1348   \use:x
1349   {

```

Now just print everything in the required format. The auxiliary __cmd_split_signature:n stores a ready-to-print token list in \l__cmd_tmpa_tl, so we ust use that here:

```

1398 \cs_new_protected:Npn \_\_cmd\_show\_command\_aux:NnNNn #1 #2 #3 #4 #5
1399 {
1400     \_\_cmd\_split_signature:n {#5}
1401     #1
1402     {
1403         \token_to_str:N #3 = #2: \iow_newline:
1404         \tl_use:N \l\_\_cmd\_tmpa_tl
1405         -> \cs_replacement_spec:N #4
1406     }
1407 }

```

Optimized functions need things done a bit differently as we need to reconstruct the argument spec.

```

1408 \cs_new_protected:Npn \_\_cmd\_show_optimized:N #
1409 {
1410     \exp_args:Nc \_\_cmd\_show\_optimized:NN
1411     { \cs_to_str:N #1 \c_space_tl code }
1412     #1
1413 }
1414 \cs_new_protected:Npn \_\_cmd\_show_optimized:NN #1#2

```

```

1415  {
1416    \cs_set:Npe \__cmd_show_optimized_aux:N ##1
1417    {
1418      \c_space_tl \c_space_tl \c_hash_str ##1 :
1419      \bool_lazy_or:nnT
1420      { \token_if_long_macro_p:N #1 }
1421      { \token_if_protected_long_macro_p:N #1 }
1422      { + } m
1423      \iow_newline:
1424    }
1425  \tl_show:e
1426  {
1427    \token_to_str:N #2 =
1428    \bool_lazy_or:nnF
1429    { \token_if_protected_macro_p:N #1 }
1430    { \token_if_protected_long_macro_p:N #1 }
1431    { expandable ~ } document~command:
1432    \iow_newline:
1433    \int_step_function:nN
1434    {
1435      \int_div_truncate:nn
1436      { \tl_count:e { \cs_parameter_spec:N #1 } }
1437      { 2 }
1438    }
1439    \__cmd_show_optimized_aux:N
1440    ->
1441    \cs_replacement_spec:N #1
1442  }
1443 }
1444 \cs_generate_variant:Nn \tl_count:n { e }
```

We can reuse most of the above to show an environment, except that we need to ensure that the proper `\environment ...` are passed to `__cmd_show_command_aux:NnNNn`. Additionally, when `\ShowCommand\foo` is used (if `\foo` is an environment), we show `\endfoo` as well, and when `\ShowCommand\endfoo` is used, change that to `\ShowCommand\foo` and do the same.

```

1445 \cs_new_protected:Npn \__cmd_show_environment:N #
1446 {
1447   \exp_after:wN \__cmd_show_environment:Nnnw #1 \q__cmd
1448   \tl_show:x
1449   {
1450     \token_to_str:N \end { \cs_to_str:N #1 } : \iow_newline:
1451     -> \exp_args:Nc \cs_replacement_spec:N
1452     { environment~ \cs_to_str:N #1 ~end~aux~ }
1453   }
1454 }
1455 \cs_new_protected:Npn \__cmd_show_environment:Nnnw #1 #2 #3 #4 \q__cmd
1456 {
1457   \use:x
1458   {
1459     \__cmd_show_command_aux:NnNNn \__cmd_show:x { document~environment }
1460     { \exp_not:N \begin {#3} }
1461     \exp_not:c { environment~ #3 ~ code }
1462     {#2}
```

```

1463         }
1464     }
1465 \cs_new_protected:Npn \__cmd_show:x #1
1466   { \iow_term:x { > ~ #1 . \iow_newline: } }
1467 \cs_new_protected:Npn \__cmd_show_environment_end:N #1
1468   {
1469     \exp_args:NNx \__cmd_check_end:Nn \l__cmd_tma_t1 { \cs_to_str:N #1 }
1470     \exp_args:Nc \__cmd_show_environment:N { \l__cmd_tma_t1 }
1471   }

```

And, of course, add `__kernel_cmd_if_xparse:NTF` and `__cmd_show:N` to `\@showcommandlisthook` and to `\@showenvironmentlisthook` (`__cmd_show:N` takes care of the environment case as well, so both entries are identical):

```

1472 \tl_gput_right:Nn \@showcommandlisthook
1473   { { \__kernel_cmd_if_xparse:NTF \__cmd_show:N } }
1474 \tl_gput_right:Nn \@showenvironmentlisthook
1475   { { \__kernel_cmd_if_xparse:NTF \__cmd_show:N } }

```

(End of definition for `__cmd_show_command:N` and others.)

`__cmd_split_signature:n`

Now we'll try a least-effort adventure into splitting the symbolic user-provided signature for a command into individual parameters for pretty-printing. A counter is used to keep track of the current argument number, and two token lists are used: `\l__cmd_tma_t1` holds the final token list to be printed, and `\l__cmd_tmpb_t1` holds just the current item, so that we can make changes to an individual item without having to dissect the whole thing (this is used for e- and E-types).

```

1476 \cs_new_protected:Npn \__cmd_split_signature:n #1
1477   {
1478     \int_set:Nn \l__cmd_current_arg_int { 1 }
1479     \tl_clear:N \l__cmd_tma_t1
1480     \tl_clear:N \l__cmd_tmpb_t1
1481     \__cmd_split_signature_loop:Nw #1 \q_recursion_tail \q_recursion_stop
1482   }

```

`__cmd_split_signature_loop:Nw`

This is the main chunk of the loop: it starts an item with `__cmd_split_start_item:` (this adds indentation and the argument number to `\l__cmd_tmpb_t1`), then checks if a special token list `\c__cmd_show_type_{type}_tl` exists. If it doesn't, the current argument is a "simple" type which needs no extra processing. Otherwise, call a specific function depending on the value of said token list.

```

1483 \cs_new_protected:Npn \__cmd_split_signature_loop:Nw #1
1484   {
1485     \quark_if_recursion_tail_stop:N #1
1486     \tl_if_empty:NT \l__cmd_tmpb_t1 { \__cmd_split_start_item: }
1487     \tl_if_exist:cTF { \c__cmd_show_type_{#1}_tl }
1488     {
1489       \use:c
1490       {
1491         \__cmd_show_
1492         \if_case:w \tl_use:c { \c__cmd_show_type_{#1}_tl } \exp_stop_f:
1493         \delim \or: delims \or: delims_opt \or: opt \or:
1494         \e \or: E \or: prefix \or: processor \fi: :Nw
1495       } #1
1496     }
1497   { \__cmd_split_end_item:n {#1} \__cmd_split_signature_loop:Nw }

```

```
1498 }
```

The token lists `\c__cmd_show_type_<type>_tl` exist for nontrivial (for printing) `<types>` that require special parsing (like delimiters or optional arguments). Values from 0 to 7 are assigned to each type:

1. a single delimiter token;
2. two delimiter tokens;
3. two delimiter tokens plus a default value;
4. a default value;
5. a list of embellishments (exclusive for e-type);
6. embellishments plus defaults (exclusive for E-type);
7. simple prefixes;
8. prefixes with arguments (argument processors);

```
1499 \cs_set_protected:Npn \__cmd_tmp:w #1 #2
1500 {
1501   \quark_if_nil:nF {#1}
1502   { \tl_const:cn { c__cmd_show_type_#1_tl } {#2} \__cmd_tmp:w }
1503 }
1504 \__cmd_tmp:w t0 r1 d1 R2 D2 03 e4 E5 +6 !6 >7 =7 \q_nil \q_nil
```

Now, based on each type we know how to act. In most cases it is just a matter of feeding in the grabbed arguments and resuming the loop. The embellishments require a bit more attention: the e-type loops through the list of embellishments and adds each to the token list as a separate argument. The E-type does more or less the same, but uses `__cmd_tl_mapthread_function:nnN` to map over two lists simultaneously, adding each token and default to the token list for printing.

```
1505 \cs_new_protected:Npn \__cmd_show_delim:Nw #1 #2
1506   { \__cmd_split_end_item:n { #1 #2 } \__cmd_split_signature_loop:Nw }
1507 \cs_new_protected:Npn \__cmd_show_delims:Nw #1 #2 #3
1508   { \__cmd_split_end_item:n { #1 #2 #3 } \__cmd_split_signature_loop:Nw }
1509 \cs_new_protected:Npn \__cmd_show_delims_opt:Nw #1 #2 #3 #4
1510   { \__cmd_split_end_item:n { #1 #2 #3 {#4} } \__cmd_split_signature_loop:Nw }
1511 \cs_new_protected:Npn \__cmd_show_opt:Nw #1 #2
1512   { \__cmd_split_end_item:n { #1 {#2} } \__cmd_split_signature_loop:Nw }
1513 \cs_new_protected:Npn \__cmd_show_e:Nw #1 #2
1514 {
1515   \tl_map_inline:nn {#2}
1516   {
1517     \__cmd_split_start_item:
1518     \__cmd_split_end_item:n { #1 ##1 }
1519   }
1520   \__cmd_split_signature_loop:Nw
1521 }
1522 \cs_set_protected:Npn \__cmd_tmp:w #1
1523 {
1524   \cs_new_protected:Npn \__cmd_show_E:Nw ##1 ##2 ##3
```

```

1525     {
1526         \cs_set_protected:Npn \__cmd_tmp:w #####1 #####2
1527         {
1528             \__cmd_split_start_item:
1529             \__cmd_split_end_item:n { ##1 #####1 #####2 } }
1530         }
1531         \__cmd_tl_mapthread_function:nnN {##2}
1532         { ##3 {#1} {#1} {#1} {#1} {#1} {#1} {#1} {#1} } \__cmd_tmp:w
1533         \__cmd_split_signature_loop:Nw
1534     }
1535 }
1536 \exp_args:NV \__cmd_tmp:w \c_novalue_tl

```

Minor wrinkle with the prefixes: they use `__cmd_split_add_item:n` instead of `__cmd_split_end_item:n` (add *vs.* end) because they are followed by an argument, so they can't end the item.

```

1537 \cs_new_protected:Npn \__cmd_show_prefix:Nw #1
1538     { \__cmd_split_add_item:n {#1} \__cmd_split_signature_loop:Nw }
1539 \cs_new_protected:Npn \__cmd_show_processor:Nw #1 #2
1540     { \__cmd_split_add_item:n { #1 {#2} } \__cmd_split_signature_loop:Nw }

```

And now the auxiliaries that store the strings to be printed. `__cmd_split_start_item:` starts an item from scratch, `__cmd_split_add_item:n` adds tokens to an item without adding a newline, and `__cmd_split_end_item:n` adds tokens, terminates the item with a newline, and steps the argument count.

```

1541 \cs_new_protected:Npn \__cmd_split_start_item:
1542     {
1543         \tl_set:Nx \l__cmd_tmpb_t1
1544         { ~ \c_space_t1 \c_hash_str \int_use:N \l__cmd_current_arg_int : }
1545     }
1546 \cs_new_protected:Npn \__cmd_split_add_item:n #1
1547     { \tl_put_right:Nx \l__cmd_tmpb_t1 { \tl_to_str:n {#1} } }
1548 \cs_new_protected:Npn \__cmd_split_end_item:n #1
1549     {
1550         \tl_put_right:Nx \l__cmd_tmpa_t1
1551         { \l__cmd_tmpb_t1 \tl_to_str:n {#1} \iow_newline: }
1552         \tl_clear:N \l__cmd_tmpb_t1
1553         \int_incr:N \l__cmd_current_arg_int
1554     }

```

(End of definition for `__cmd_split_signature:n` and others.)

Not much to do regarding `\@showcommandlisthook`: we could remove the entries from `\@showcommandlisthook`, but it doesn't seem worth it.

```

1559 \langle latexrelease \rangle \EndIncludeInRelease

```

1.8 Grabbing arguments

All of the grabbers follow the same basic pattern. The initial function stores in `\l__cmd_signature_t1` the code to grab further arguments, defines (the function in) `\l__cmd_fn_t1` that will grab the argument, and calls it.

Defining `\l__cmd_fn_t1` means determining whether to use `\cs_set:Npn` or `\cs_set_nopar:Npn`, and for optional arguments whether to skip spaces. Once the argument is found, `\l__cmd_fn_t1` calls `__cmd_add_arg:n`, responsible for calling processors and grabbing further arguments.

```
\__cmd_grab_b:w
\__cmd_grab_b_long:w
\__cmd_grab_b_obey_spaces:w
\__cmd_grab_b_long_obey_spaces:w
\__cmd_grab_b_aux>NNw
\__cmd_grab_b_end:Nw
```

This uses the well-tested code of D-type arguments, skipping the peeking step because the b-type argument is always present, and adding a cleanup stage at the end by hijacking the signature. The clean-up consists of properly dealing with `\l__cmd_args_t1` and also putting back the `\end` that served as an end-delimiter: this `\end` receives the environment name as its argument and is run normally. The D-type code stores the argument found (body of the environment) as a brace group in `\l__cmd_args_t1` and depending on the presence of a prefix ! we trim spaces or not before adding this braced argument into the saved `\l__cmd_args_t1`. The strange `\begin_` control sequence is there for display purposes only: it has to look like `\begin` in the terminal but not to delimited arguments.

```
1560 \cs_new_protected:Npn \__cmd_grab_b:w
1561   { \__cmd_grab_b_aux>NNw \cs_set_protected_nopar:Npn \tl_trim_spaces:n }

We need to see if the current line contains `\end` followed by the name of the current environment. To do that and allow for spaces, we have to work stepwise. First, establish if there is an `\end` at all: remember that here we are dealing with “other” tokens. Whether these is an `\end` or not, the tokens *before* it form part of the line.

```

1628 \use:e

1639     }
1640     { \__cmd_grab_c_auxii:w #2 \scan_stop: }
1641 }

```

There is an `\end`, so we now remove the trailing marker we needed to do the test. This is stripped off, then we need to examine the rest of the line one token at a time: see `verbatim.dtx` for the inspiration. Notice that we use `^M` here as the end marker: this allows looping to look for multiple `\end` entries in the line.

```

1642 \group_begin:
1643   \char_set_catcode_other:N \^M %
1644   \use:e %

1653   } %

```

Within the line, we need to collect up the tokens: if we do not find the end-of-environment argument, we will need those to reinsert. There are three special cases here: `^M` (end of line: tidy up and back to the main loop), `\` (possibly skip over) and `{` (start the inner loop). Anything else means we move back to examine the rest of the line for any more `\end` entries.

```

```

In the inner loop, we again have only a few special cases. First, we could again have $\sim\sim M$, in which case we tidy up using a common auxiliary. Second, we check for the escape char: this cannot happen inside the end of an environment and means we loop, re-inserting the token. Finally, we have $\}$, where we need to move on to check what has been collected. Otherwise, collect up and loop. Notice here that the inner loop needs to collect tokens separately: this leaves any spaces after \end in $\l__cmd_tmpa_tl$, so we can test $\l__cmd_tmpb_tl$ directly.

1787     }
1788 }
1789 }
1790 }
```

This is a bit complicated. The idea is that, in order to check for nested optional argument tokens ([[...]]) and so on) the argument needs to be grabbed without removing any braces at all. If this is not done, then cases like [{[]}] fail. So after testing for an optional argument, it is collected piece-wise. Inserting a quark prevents loss of braces, and there is then a test to see if there are nested delimiters to handle.

```

1791 \group_begin:
1792     \char_set_catcode_other:N \^^M

Inside the “standard” grabber, there is a test to see if the grabbed argument is entirely enclosed by braces. There are a couple of extra factors to allow for: the argument might be entirely empty, and spaces at the start and end of the input must be retained around a brace group. Also notice that a *blank* argument might still contain spaces. To allow for suppression of brace stripping, the business end is passed here as #5.

(End of definition for `__cmd_grab_D:w` and others.)

`__cmd_grab_D_nested:NNnN` Catching nested optional arguments means more work. The aim here is to collect up each pair of optional tokens without TeX helping out, and without counting anything. The code above will already have removed the leading opening token and a closing token, but the wrong one. The aim is then to work through the material grabbed so far and divide it up on each opening token, grabbing a closing token to match (thus working in pairs). Once there are no opening tokens, then there is a second check to see if there

`__cmd_grab_D_nested:w`

`\l__cmd_nesting_a_tl`

`\l__cmd_nesting_b_tl`

`\q__cmd`

are any opening tokens in the second part of the argument (for things like `[] []`). Once everything has been found, the entire collected material is added to the output as a single argument. The only tricky part here is ensuring that any grabbing function that might run away is named after the function currently being parsed and not after `xparse`. That leads to some rather complex nesting! There is also a need to prevent the loss of any braces, hence the insertion and removal of quarks along the way.

```

`__cmd_grab_D_call:Nw` For D and R-type arguments, to avoid losing any braces, a token needs to be inserted before the argument to be grabbed. If the argument runs away because the closing token is missing then this inserted token shows up in the terminal. Ideally, `#1` would therefore be used directly, but that is no good as it will mess up the rest of the grabber. Instead, a copy of `#1` with an altered category code is used, as this will look right in the terminal but will not mess up the grabber. The only issue then is that the category code of `#1` is unknown. So there is a quick test to ensure that the inserted token can never be

matched by the grabber. (This assumes that the open and close delimiters are not the same character with different category codes, but that really should not happen in any sensible document-level syntax.) An exception is when #1 is a control sequence token, in which case the character-token treatment is no good because if hit with `\token_to_-str:N` it would add spurious tokens to the argument. In this case a different branch is taken. The token inserted is then the same `<csname>` as #1, but with a space appended, so that the grabber don't see it as another of the same delimiter.

```

\__cmd_peek_meaning_remove:NTF
```

A loop is needed here to allow a random ordering of keys. These are searched for one at a time, with any not found needing to be tracked: they can appear later. The grabbed values are held in a property list which is then turned into an ordered list to be passed back to the user.

```

Firstly, it is necessary to change `\tex_endlinechar:D` so that newlines in different catcode regimes (e.g., `\ExplSyntaxOn`) are not misinterpreted as spaces. The opening delimiter is the first non-space token, and is never read verbatim. This is required by consistency with the case where the preceding argument was optional and absent: then TeX has already read and tokenized that token when looking for the optional argument. The first thing is thus to check is that this delimiter is a character, and to distinguish the case of a left brace (in that case, `\group_align_safe_end:` is needed to compensate for the begin-group character that was just seen). Then set verbatim catcodes with `_cmd_grab_v_aux_catcodes::`.

The group keep catcode changes local, and `\group_align_safe_begin/end:` allow to use a character with category code 4 (normally `&`) as the delimiter (all commands do `\group_align_safe_begin/end:`, so there's no need to do that again here). It is ended by `_cmd_grab_v_group_end:`, which smuggles the collected argument out of the group.

`_cmd_grab_v_aux_test:N` Check that the opening delimiter is a character, setup category codes, then start reading tokens one by one, keeping the delimiter as an argument. If the verbatim was not nested, we will be grabbing one character at each step. Unfortunately, it can happen that what follows the verbatim argument is already tokenized. Thus, we check at each step that the next token is indeed a “nice” character, *i.e.*, is not a character with category code 1 (begin-group), 2 (end-group) or 6 (macro parameter), nor the space character, with category code 10 and character code 32, nor a control sequence. The partially built argument is stored in `\l__cmd_v_arg_t1`. If we ever meet a token which we cannot grab (non-N-type), or which is not a character according to `_cmd_grab_v_token_if_char:NTF`, then we bail out with `_cmd_grab_v_aux_abort:n`. Otherwise, we stop at the first character matching the delimiter.

`__cmd_grab_v_bgroup:` If the opening delimiter is a left brace, we keep track of how many left and right braces were encountered so far in `\l__cmd_v_nesting_int` (the methods used for optional arguments cannot apply here), and stop as soon as it reaches 0.

Some care was needed when removing the opening delimiter, which has already been assigned category code 1: using `\peek_meaning_remove:NTF` in the `__cmd_grab_v_aux:w` function would break within alignments. Instead, we first convert that token to a string, and remove the result as a normal undelimited argument.

`__cmd_grab_v_bgroup_loop:N`.)

`__cmd_grab_v_aux_catcodes:` The approach for short verbatim arguments is to make the end-line character a macro parameter character: this is forbidden by the rest of the code. Then the error branch can check what caused the bail out and give the appropriate error message.

`_cmd_grab_v_token_if_char:NTF`

This function assumes that the escape character is printable. Then the string representation of control sequences is at least two characters, and `\str_tail:n` only removes the escape character. Macro parameter characters are doubled by `\tl_to_str:n`, and will also yield a non-empty result, hence are not considered as characters.

```

2260 \cs_new_protected:Npn \_cmd_grab_v_token_if_char:NTF #1
2261   { \str_if_eq:eeTF { } { \str_tail:n {#1} } }

```

(End of definition for `_cmd_grab_v_token_if_char:NTF.`)

`_cmd_add_arg:n`

When an argument is found it is stored, then further arguments are grabbed by calling `\l__cmd_signature_tl`.

`_cmd_add_arg:V`

1.9 Grabbing arguments expandably

```
\__cmd_expandable_grab_D:w
  \__cmd_expandable_grab_D:NNNwNNn
  \__cmd_expandable_grab_D:NNNwNNnnn
\__cmd_expandable_grab_D:Nw
  \__cmd_expandable_grab_D:nnNNNwNN
```

The first step is to grab the first token or group. The generic grabbers $\langle function \rangle_{\sqcup}$ and $\langle function \rangle_{\sqcap}$ are just after $\backslash q_cmd$, we go and find them (and use the long one).

```
2268 \cs_new:Npn \__cmd_expandable_grab_D:w #1 \q_cmd #2#3
2269 { #2 { \__cmd_expandable_grab_D:NNNwNNn #1 \q_cmd #2 #3 } }
```

We then wish to test whether #7, which we just grabbed, is exactly #2. A preliminary test is whether their string representations coincide, then expand the only grabber function we have, #1, once: the two strings below are equal if and only if #7 matches #2 exactly.² The preliminary test is needed as #7 could validly contain $\backslash par$ (because a later mandatory argument could be long) and our grabber may be short. If #7 does not match #2, then the optional argument is missing, we use the default $-NoValue-$, and put back the argument #7 in the input stream.

If it does match, then interesting things need to be done. We will grab the argument piece by piece, with the following pattern:

```
<grabber> {<tokens>}
\q_nil {<piece 1>} <piece 2> \ERROR \q_cmd
\q_nil <input stream>
```

The *<grabber>* will find an opening delimiter in *<piece 2>*, take the $\backslash q_cmd$ as a second delimiter, and find more material delimited by the closing delimiter in the *<input stream>*. We then move the part before the opening delimiter from *<piece 2>* to *<piece 1>*, and the material taken from the *<input stream>* to the *<piece 2>*. Thus, the argument moves gradually from the *<input stream>* to the *<piece 2>*, then to the *<piece 1>* when we have made sure to find all opening and closing delimiters. This two-step process ensures that nesting works: the number of opening delimiters minus closing delimiters in *<piece 1>* is always equal to the number of closing delimiters in *<piece 2>*. We stop grabbing arguments once the *<piece 2>* contains no opening delimiter any more, hence the balance is reached, and the final argument is *<piece 1>* *<piece 2>*. The indirection via $\backslash _cmd_tmp:w$ allows to insert $-NoValue-$ expanded.

```
2270 \cs_set_protected:Npn \__cmd_tmp:w #1
2271 {
2272   \cs_new:Npn \__cmd_expandable_grab_D:NNNwNNn ##1##2##3##4 \q_cmd ##5##6##7
2273   {
2274     \str_if_eq:nnTF {##2} {##7}
2275     {
2276       \str_if_eq:onTF
2277         { ##1 { } { } ##7 ##2 \q_cmd ##3 }
2278         { { } {##2} { } }
2279     }
2280     { \use_i:nn }
2281   {
2282     ##1
2283     { \__cmd_expandable_grab_D:NNNwNNnnn ##1##2##3##4 \q_cmd ##5##6 }
```

²It is obvious that if #7 matches #2 then the strings are equal. We must check the converse. The right-hand-side of $\backslash str_if_eq:onTF$ does not end with #3, implying that the grabber function took everything as its arguments. The first brace group can only be empty if #7 starts with #2, otherwise the brace group preceding #7 would not vanish. The third brace group is empty, thus the $\backslash q_cmd$ that was used by our grabber #1 must be the one that we inserted (not some token in #7), hence the second brace group contains the end of #7 followed by #2. Since this is #2 on the right-hand-side, and no brace can be lost there, #7 must contain nothing else than its leading #2.

```

2284         \q_nil { } ##2 \ERROR \q__cmd \ERROR
2285     }
2286     { ##4 {#1} \q__cmd ##5 ##6 {##7} }
2287   }
2288 }
2289 \exp_args:No \__cmd_tmp:w { \c_novalue_t1 }

At this stage, #7 is \q_nil {piece 1} <more for piece 1>, and we want to concatenate all that, removing \q_nil, and keeping the opening delimiter #2. Simply use \use_ii:nn. Also, #8 is <remainder of piece 2> \ERROR, and #9 is \ERROR <more for piece 2>. We concatenate those, replacing the two \ERROR by the closing delimiter #3.

```

```

2290 \cs_new:Npn \__cmd_expandable_grab_D:NNNwNNnnn #1#2#3#4 \q__cmd #5#6#7#8#9
2291 {
2292   \exp_args:Nof \__cmd_expandable_grab_D:nnNNNwNN
2293   { \use_ii:nn #7 #2 }
2294   { \__cmd_expandable_grab_D:Nw #3 \exp_stop_f: #8 #9 }
2295   #1#2#3 #4 \q__cmd #5 #6
2296 }
2297 \cs_new:Npn \__cmd_expandable_grab_D:Nw #1#2 \ERROR \ERROR { #2 #1 }

Armed with our two new <pieces>, we are ready to loop. However, we must first see if <piece 2> (here #2) contains any opening delimiter #4. Again, we expand #3, this time removing its whole output with \use_none:nnn. The test is similar to \tl_if_in:nnTF. The token list is empty if and only if #2 does not contain the opening delimiter. In that case, we are done, and put the argument (from which we remove a spurious pair of delimiters coming from how we started the loop). Otherwise, we go back to looping with \__cmd_expandable_grab_D:NNNwNNnnn. The code to deal with brace stripping is much the same as for the non-expandable case.

```

\__cmd_expandable_grab_E_find:w
\__cmd_expandable_grab_E_find:nnw
\__cmd_expandable_grab_E_end:nnw

```

We keep track of long/short by placing the appropriate grabber as the third token after `\q__cmd`; it is eventually removed by the `end:nnw` auxiliary. The `aux:w` auxiliary will be called repeatedly with two arguments: the set of pairs `<parser> <token>`, and the set of arguments found so far (initially all `{-NoValue-}`). At each step, grab what follows in the input stream then call the `loop:nnnNNw` auxiliary to compare it with each possible embellishment in turn. This auxiliary's #1 is what was found in the input, #2 collects `<parser> <token>` pairs that did not match, #3 collects the corresponding arguments found previously, #4 and #5 is the current pair, #6 is the remaining pairs, #7 is empty or two `\q_nil`, and #8 is the current argument. If none of the pairs matched (determined by `\quark_if_nil:NTF`) then call the `end` auxiliary to stop looking for embellishments, remembering to put what was grabbed in the input back where it belongs, and storing

the arguments found just before `\q__cmd`. If the current argument #8 is not `-NoValue-` or if the input #1 does not match #5 (see t-type arguments below for a similar `\str_if_eq:onTF` test) then carry on the loop. Otherwise, we found a new embellishment: grab the corresponding argument in the input using the `find:w` auxiliary. To avoid losing braces around that auxiliary's argument we include a space, which will be eliminated in the next loop through embellishments.

1.11 Conversion to key–value form

This is implemented as a process but with no public interfaces, hence is treated separately from the others: it's a feature of \tcmd which just happens to use the same mechanism as a processor.

The two clear-cut cases have been eliminated, and we therefore have to deal with a search for = signs. We need an “action” loop here so we do not get misled by for example {=}. As the code here is for very much predictable types of input, we hard-code what constitutes math mode opening and closing. At the very beginning, the default key (#1) and the argument as given by the user (#2) are placed right after the \q__cmd_recursion_stop, so that when the recursion ends, the macros __cmd_arg_to_keyvalue_set_default:nn or __cmd_arg_to_keyvalue_set_keyvalue:nn can be used to grab these two items and

set the \ProcessedArgument accordingly.

1.12 Utilities

`__cmd_check_definable:nNT`
`__cmd_check_definable_aux:nN`

Check that a token list is appropriate as a first argument of `\NewDocumentCommand` and similar functions and otherwise produce an error. First trim whitespace to allow for spaces around the actual command to be defined. If the result has multiple tokens, it is not a valid argument. The single token is a control sequence exactly if its string representation has more than one character (using `\token_to_str:N` rather than `\tl_to_str:n` to avoid problems with macro parameter characters, and setting `\tex_escapechar:D` to prevent it from being non-printable). Finally, check for an active character: this is done by lowercasing the token to fix its character code (arbitrarily to that of `?`) and comparing the result to an active `?`. Both control sequences and active characters are valid arguments, and non-active character tokens are not. In all cases, the group opened to keep assignments local must be closed.

```

2661 \cs_new_protected:Npn \__cmd_check_definable:nNT #1
2662   { \tl_trim_spaces_apply:nN {#1} \__cmd_check_definable_aux:nN }
2663 \group_begin:
2664   \char_set_catcode_active:n { ‘? ’ }
2665 \cs_new_protected:Npn \__cmd_check_definable_aux:nN #1#2
2666  {
2667   \group_begin:
2668   \tl_if_single_token:nTF {#1}
2669   {
2670     \int_set:Nn \tex_escapechar:D { 92 }
2671     \exp_args:Nx \tl_if_empty:nTF
2672       { \exp_args:No \str_tail:n { \token_to_str:N #1 } }
2673   }

```

```

2674   \exp_args:Nx \char_set_lccode:nn
2675     { ` \str_head:n {#1} } { '?' }
2676     \tex_lowercase:D { \tl_if_eq:nnTF {#1} } { ? }
2677     { \group_end: \use_iii:nnn }
2678     { \group_end: \use_i:nnn }
2679   }

2691 }
2692 \group_end:

```

(End of definition for `__cmd_check_definable:nNT` and `__cmd_check_definable_aux:nN`.)

`__cmd_token_if_cs:NTF`

Based on the definition of `__cmd_check_definable_aux:nN` above, but only checks for an actual control sequence (*i.e.*, `\anything`). `\tex_escapechar:D` is temporarily changed to a known value and then it checks if `\string#1` contains more than one character: if it does, it's a control sequence. This test differs from `\token_if_cs:NTF` for example in `\token_if_cs:NTF \c_group_begin_token {T}{F}`, where `\token_if_cs:NTF` returns false.

```

2693 \cs_new_protected:Npn \__cmd_token_if_cs:NTF #1

`__kernel_cmd_if_xparse:NTF`
`__cmd_cmd_type_cases:NnnnnF`
`__cmd_cmd_if_xparse_aux:N`

To determine whether the command is an `xparse` command check that its `arg_spec` is empty (this also excludes non-macros) and that its `replacement_spec` starts with either `__cmd_start:nNNnnn` (non-expandable command) or `__cmd_start_expandable:nNNNNn` (expandable command) or `__cmd_start_optimized:` (optimized command) or `__cmd_start_env:nnnnn` (environment) or `\environment #1 end aux` (environment end).

This conditional is needed in several kernel modules and is therefore has a kernel-internal name.

__cmd_peek_meaning:NTF
__cmd_peek_meaning_remove:NTF
__cmd_peek_cs_check_equal:NNN
__cmd_peek_meaning_aux:NNTF
__cmd_peek_true_remove:Nw

Peek ahead for a token with a given meaning. In case the search token is a control sequence, also check that the <csname> is the same as the control sequence peeked at. This extra verification is necessary when the command is delimited by control sequence tokens (as opposed to character tokens), and we want the exact same control sequence to match.

```

1.14 User functions

The user functions are more or less just the internal functions renamed.

\BooleanFalse Design-space names for the Boolean values.

```

3069 \cs_new_eq:NN \BooleanFalse \c_false_bool
3070 \cs_new_eq:NN \BooleanTrue \c_true_bool

```

(End of definition for \BooleanFalse and \BooleanTrue.)

\NewDocumentCommand \RenewDocumentCommand \ProvideDocumentCommand \DeclareDocumentCommand The user macros are pretty simple wrappers around the internal ones. There is however a check that the first argument is a single token, possibly surrounded by spaces (hence the strange \use:nnn), and is definable.

```

```

(End of definition for `\NewExpandableDocumentCommand` and others.)

`\IfBooleanT` The logical `<true>` and `<false>` statements are just the normal `\c_true_bool` and `\c_false_bool` so `\bool_if:NTF` is almost enough. However, this code-level function blows up badly when passed invalid input. We want `\IfBooleanTF` to accept a single (non-space) token equal to `\c_true_bool` or `\c_false_bool`, possibly surrounded by spaces. If the input is blank or multiple items, jump to the error and pick the false branch. If the input, ignoring spaces (we do this by omitting braces in the `\tl_if_single_token:nF` test), is not a single token then jump to the error as well. It is then safe to compare the token to the two booleans, picking the appropriate branch. If neither matches, we jump to the error as well.

```
3229 \cs_new:Npn \IfBooleanTF #1
```

```

3271 \cs_new_eq:NN \TrimSpaces \__cmd_trim_spaces:n
```

(End of definition for \ReverseBoolean and others.)

\ProcessList To support \SplitList.

```
3272 \cs_new_eq:NN \ProcessList \tl_map_tokens:nn
```

(End of definition for \ProcessList.)

Finally as promised, restore __kernel_chk_if_free_cs:N:

```
3273 ⟨latexrelease⟩\cs_gset_eq:NN \__kernel_chk_if_free_cs:N \__cmd_chk_if_free_cs:N  
3274 ⟨latexrelease⟩\cs_undefine:N \__cmd_chk_if_free_cs:N  
3275 ⟨latexrelease⟩  
3276 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}{ltcmd} %  
3277 ⟨latexrelease⟩ \Document~command~parser %  
3278 ⟨latexrelease⟩  
3279 ⟨latexrelease⟩\EndModuleRelease  
3280 \ExplSyntaxOff
```

Now in `latexrelease` mode, redefine `\NewDocumentCommand` to not complain on commands already defined.

```
3281 ⟨latexrelease⟩\@ifundefined{ExplSyntaxOff}{}{\latexrelease@postltcmd}  
3282 ⟨latexrelease⟩\catcode`^@=\@latexrelease@catcode@null\relax  
3283 /2ekernel | latexrelease)
```

We need to stop DocStrip treating `@@` in a special way at this point.

```
3284 ⟨@@=
```

File 08

lthooks.dtx

1 Introduction

Hooks are points in the code of commands or environments where it is possible to add processing code into existing commands. This can be done by different packages that do not know about each other, and to allow for hopefully safe processing it is necessary to sort different chunks of code added by different packages into a suitable processing order.

This is done by the packages adding chunks of code (via `\AddToHook`) and labeling their code with some label by default using the package name as a label.

At `\begin{document}` all code for a hook is then sorted according to some rules (given by `\DeclareHookRule`) for fast execution without processing overhead. If the hook code is modified afterwards (or the rules are changed), a new version for fast processing is generated.

Some hooks are used already in the preamble of the document. If that happens then the hook is prepared for execution (and sorted) already at that point.

2 Package writer interface

The hook management system is offered as a set of CamelCase commands for traditional L^AT_EX 2_E packages (and for use in the document preamble if needed) as well as `expl3` commands for modern packages, that use the L3 programming layer of L^AT_EX. Behind the scenes, a single set of data structures is accessed so that packages from both worlds can coexist and access hooks in other packages.

2.1 L^AT_EX 2_E interfaces

2.1.1 Declaring hooks

With a few exceptions, hooks have to be declared before they can be used. The exceptions are the generic hooks for commands and environments (executed at `\begin` and `\end`), and the generic hooks run when loading files (see section 3.1).

`\NewHook \NewHook {⟨hook⟩}`

Creates a new `⟨hook⟩`. If this hook is declared within a package it is suggested that its name is always structured as follows: `⟨package-name⟩/⟨hook-name⟩`. If necessary you can further subdivide the name by adding more / parts. If a hook name is already taken, an error is raised and the hook is not created.

The `⟨hook⟩` can be specified using the dot-syntax to denote the current package name. See section 2.1.5. The string ?? can't be used as a hook name because it has a special significance as a placeholder in hook rules.

```
\NewReversedHook \NewReversedHook {\hook}
```

Like `\NewHook` declares a new `\hook`. the difference is that the code chunks for this hook are in reverse order by default (those added last are executed first). Any rules for the hook are applied after the default ordering. See sections 2.3 and 2.4 for further details.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\NewMirroredHookPair \NewMirroredHookPair {\hook-1} {\hook-2}
```

A shorthand for `\NewHook{\hook-1}\NewReversedHook{\hook-2}`.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\NewHookWithArguments \NewHookWithArguments {\hook} {number}
```

New: 2023-06-01

Creates a new `\hook` whose code takes `number` arguments, and otherwise works exactly like `\NewHook`. Section 2.7 explains hooks with arguments.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\NewReversedHookWithArguments \NewReversedHookWithArguments {\hook} {number}
```

New: 2023-06-01

Like `\NewReversedHook`, but creates a hook whose code takes `number` arguments. Section 2.7 explains hooks with arguments.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\NewMirroredHookPairWithArguments \NewMirroredHookPairWithArguments {\hook-1} {\hook-2} {number}
```

New: 2023-06-01

A shorthand for `\NewHookWithArguments{\hook-1}{number}`

`\NewReversedHookWithArguments{\hook-2}{number}`. Section 2.7 explains hooks with arguments.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

2.1.2 Special declarations for generic hooks

The declarations here should normally not be used. They are available to provide support for special use cases mainly involving generic command hooks.

```
\DisableGenericHook \DisableGenericHook {\hook}
```

After this declaration³ the `\hook` is no longer usable: Any further attempt to add code to it will result in an error and any use, e.g., via `\UseHook`, will simply do nothing.

This is intended to be used with generic command hooks (see `lthcmdhooks-doc`) as depending on the definition of the command such generic hooks may be unusable. If that is known, a package developer can disable such hooks up front.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

³In the 2020/06 release this command was called `\DisableHook`, but that name was misleading as it shouldn't be used to disable non-generic hooks.

\ActivateGenericHook `\ActivateGenericHook {<hook>}`

This declaration activates a generic hook provided by a package/class (e.g., one used in code with `\UseHook` or `\UseOneTimeHook`) without it being explicitly declared with `\NewHook`). If the hook is already activated, this command does nothing.

Note that this command does not undo the effect of `\DisableGenericHook`. See section 2.6 for a discussion of when this declaration is appropriate.

2.1.3 Using hooks in code

Using a hook that is executing the code that has been associated with it is only allowed if the hook has been previously declared with `\NewHook`. For performance reason there are no runtime checks for this and it is the responsibility of the programmer of a package to ensure that all hooks that are used in a package (with one of the commands in this section) are declared first.

\UseHook `\UseHook {<hook>}`

Execute the code stored in the `<hook>`.

Before `\begin{document}` the fast execution code for a hook is not set up, so in order to use a hook there it is explicitly initialized first. As that involves assignments using a hook at those times is not 100% the same as using it after `\begin{document}`.

The `<hook>` *cannot* be specified using the dot-syntax. A leading `.` is treated literally.

\UseHookWithArguments `\UseHookWithArguments {<hook>} {<number>} {<arg1>} ... {<argn>}`

New: 2023-06-01

Execute the code stored in the `<hook>` and pass the arguments `{<arg1>}` through `{<argn>}` to the `<hook>`. Otherwise, it works exactly like `\UseHook`. The `<number>` should be the number of arguments declared for the hook. If the hook is not declared, this command does nothing and it will remove `<number>` items from the input. Section 2.7 explains hooks with arguments.

The `<hook>` *cannot* be specified using the dot-syntax. A leading `.` is treated literally.

\UseOneTimeHook `\UseOneTimeHook {<hook>}`

Some hooks are only used (and can be only used) in one place, for example, those in `\begin{document}` or `\end{document}`. From that point onwards, adding to the hook through a defined `\addto{cmd}` command (e.g., `\AddToHook` or `\AtBeginDocument`, etc.) would have no effect (as would the use of such a command inside the hook code itself). It is therefore customary to redefine `\addto{cmd}` to simply process its argument, i.e., essentially make it behave like `\@firstofone`.

`\UseOneTimeHook` does that: it records that the hook has been consumed and any further attempt to add to it will result in executing the code to be added immediately.

Using `\UseOneTimeHook` several times with the same `{<hook>}` means that it only executes the first time it is used. For example, if it is used in a command that can be called several times then the hook executes during only the *first* invocation of that command; this allows its use as an “initialization hook”.

Mixing `\UseHook` and `\UseOneTimeHook` for the same `{<hook>}` should be avoided, but if this is done then neither will execute after the first `\UseOneTimeHook`.

The `<hook>` *cannot* be specified using the dot-syntax. A leading `.` is treated literally. See section 2.1.5 for details.

```
\UseOneTimeHookWithArguments \UseOneTimeHookWithArguments {\hook} {\number} {\arg_1} ... {\arg_n}
```

New: 2023-06-01

Works exactly like `\UseOneTimeHook`, but passes arguments $\{\arg_1\}$ through $\{\arg_n\}$ to the $\langle\text{hook}\rangle$. The $\langle\text{number}\rangle$ should be the number of arguments declared for the hook. If the hook is not declared, this command does nothing and it will remove $\langle\text{number}\rangle$ items from the input.

It should be noted that after a one-time hook is used, it is no longer possible to use `\AddToHookWithArguments` or similar with that hook. `\AddToHook` continues to work as normal. Section 2.7 explains hooks with arguments.

The $\langle\text{hook}\rangle$ *cannot* be specified using the dot-syntax. A leading `.` is treated literally. See section 2.1.5 for details.

2.1.4 Updating code for hooks

In contrast to the commands from the previous section, declarations such as `\AddToHook` or `\DeclareHookRule` can be used even when the hook is not yet declared. The rationale is that the hook declaration may be in some package that is loaded later, or perhaps not loaded at all.

A side effect of this design is that misspellings do not raise an error but are simply regarded as declarations for hooks with a different name.

```
\AddToHook \AddToHook {\hook} [{label}] {\code}
```

Adds $\langle\text{code}\rangle$ to the $\langle\text{hook}\rangle$ labeled by $\langle\text{label}\rangle$. When the optional argument $\langle\text{label}\rangle$ is not provided, the $\langle\text{default label}\rangle$ is used (see section 2.1.5). If `\AddToHook` is used in a package/class, the $\langle\text{default label}\rangle$ is the package/class name, otherwise it is **top-level** (the **top-level** label is treated differently: see section 2.1.6).

If there already exists code under the $\langle\text{label}\rangle$ then the new $\langle\text{code}\rangle$ is appended to the existing one (even if this is a reversed hook). If you want to replace existing code under the $\langle\text{label}\rangle$, first apply `\RemoveFromHook`.

The hook doesn't have to exist for code to be added to it. However, if it is not declared, then obviously the added $\langle\text{code}\rangle$ will never be executed. This allows for hooks to work regardless of package loading order and enables packages to add to hooks from other packages without worrying whether they are actually used in the current document. See section 2.1.8.

The $\langle\text{hook}\rangle$ and $\langle\text{label}\rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\AddToHookWithArguments \AddToHookWithArguments {\hook} [{label}] {\code}
```

New: 2023-06-01

Works exactly like `\AddToHook`, except that the `\code` can access the arguments passed to the hook using `#1`, `#2`, ..., `#n` (up to the number of arguments declared for the hook). If the `\code` should contain *parameter tokens* (`#`) that are not supposed to be understood as the arguments of the hook, such tokens should be doubled. For example, with `\AddToHook` one can write:

```
\AddToHook{myhook}{\def\foo#1{Hello, #1!}}
```

but to achieve the same with `\AddToHookWithArguments`, one should write:

```
\AddToHookWithArguments{myhook}{\def\foo##1{Hello, ##1!}}
```

because in the latter case, `#1` refers to the first argument of the hook `myhook`. Section 2.7 explains hooks with arguments.

The `\hook` and `\label` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\RemoveFromHook \RemoveFromHook {\hook} [{label}]
```

Removes any code labeled by `\label` from the `\hook`. When the optional argument `\label` is not provided, the `\default_label` is used (see section 2.1.5).

If there is no code under the `\label` in the `\hook`, or if the `\hook` does not exist, a warning is issued when you attempt to `\RemoveFromHook`, and the command is ignored. `\RemoveFromHook` should be used only when you know exactly what labels are in a hook. Typically this will be when some code gets added to a hook by a package, then later this code is removed by that same package. If you want to prevent the execution of code from another package, use the `voids` rule instead (see section 2.1.7).

If the optional `\label` argument is `*`, then all code chunks are removed. This is rather dangerous as it may well drop code from other packages (that one may not know about); it should therefore not be used in packages but only in document preambles!

The `\hook` and `\label` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

In contrast to the `voids` relationship between two labels in a `\DeclareHookRule` this is a destructive operation as the labeled code is removed from the hook data structure, whereas the relationship setting can be undone by providing a different relationship later.

A useful application for this declaration inside the document body is when one wants to temporarily add code to hooks and later remove it again, e.g.,

```
\AddToHook{env/quote/begin}{\small}
\begin{quote}
  A quote set in a smaller typeface
\end{quote}
...
\RemoveFromHook{env/quote/begin}
... now back to normal for further quotes
```

Note that you can't cancel the setting with

```
\AddToHook{env/quote/begin}{}
```

because that only “adds” a further empty chunk of code to the hook. Adding `\normalsize` would work but that means the hook then contained `\small\normalsize` which means two font size changes for no good reason.

The above is only needed if one wants to typeset several quotes in a smaller typeface. If the hook is only needed once then `\AddToHookNext` is simpler, because it resets itself after one use.

```
\AddToHookNext \AddToHookNext {\<hook>} {\<code>}
```

Adds `<code>` to the next invocation of the `<hook>`. The code is executed after the normal hook code has finished and it is executed only once, i.e. it is deleted after it was used.

Using this declaration is a global operation, i.e., the code is not lost even if the declaration is used inside a group and the next invocation of the hook happens after the end of that group. If the declaration is used several times before the hook is executed then all code is executed in the order in which it was declared.⁴

If this declaration is used with a one-time hook then the code is only ever used if the declaration comes before the hook’s invocation. This is because, in contrast to `\AddToHook`, the code in this declaration is not executed immediately in the case when the invocation of the hook has already happened—in other words, this code will truly execute only on the next invocation of the hook (and in the case of a one-time hook there is no such “next invocation”). This gives you a choice: should my code execute always, or should it execute only at the point where the one-time hook is used (and not at all if this is impossible)? For both of these possibilities there are use cases.

It is possible to nest this declaration using the same hook (or different hooks): e.g.,

```
\AddToHookNext{\<hook>}{\<code-1>}\AddToHookNext{\<hook>}{\<code-2>}}
```

will execute `<code-1>` next time the `<hook>` is used and at that point puts `<code-2>` into the `<hook>` so that it gets executed on following time the hook is run.

A hook doesn’t have to exist for code to be added to it. This allows for hooks to work regardless of package loading order. See section 2.1.8.

The `<hook>` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\AddToHookNextWithArguments \AddToHookNextWithArguments {\<hook>} {\<code>}
```

New: 2023-06-01

Works exactly like `\AddToHookNext`, but the `<code>` can contain references to the arguments of the `<hook>` as described for `\AddToHookWithArguments` above. Section 2.7 explains hooks with arguments.

The `<hook>` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\ClearHookNext \ClearHookNext {\<hook>}
```

Normally `\AddToHookNext` is only used when you know precisely where it will apply and why you want some extra code at that point. However, there are a few use cases in which such a declaration needs to be canceled, for example, when discarding a page with `\DiscardShipoutBox` (but even then not always), and in such situations `\ClearHookNext` can be used.

⁴There is no mechanism to reorder such code chunks (or delete them).

2.1.5 Hook names and default labels

It is best practice to use `\AddToHook` in packages or classes *without specifying a `\label`* because then the package or class name is automatically used, which is helpful if rules are needed, and avoids mistyping the `\label`.

Using an explicit `\label` is only necessary in very specific situations, e.g., if you want to add several chunks of code into a single hook and have them placed in different parts of the hook (by providing some rules).

The other case is when you develop a larger package with several sub-packages. In that case you may want to use the same `\label` throughout the sub-packages in order to avoid that the labels change if you internally reorganize your code.

Except for `\UseHook`, `\UseOneTimeHook` and `\IfHookEmptyTF` (and their `\Expl3` interfaces `\hook_use:n`, `\hook_use_once:n` and `\hook_if_empty:nTF`), all `\hook` and `\label` arguments are processed in the same way: first, spaces are trimmed around the argument, then it is fully expanded until only character tokens remain. If the full expansion of the `\hook` or `\label` contains a non-expandable non-character token, a low-level `\TeX` error is raised (namely, the `\hook` is expanded using `\TeX`'s `\csname...` `\endcsname`, as such, Unicode characters are allowed in `\hook` and `\label` arguments). The arguments of `\UseHook`, `\UseOneTimeHook`, and `\IfHookEmptyTF` are processed much in the same way except that spaces are not trimmed around the argument, for better performance.

It is not enforced, but highly recommended that the hooks defined by a package, and the `\labels` used to add code to other hooks contain the package name to easily identify the source of the code chunk and to prevent clashes. This should be the standard practice, so this hook management code provides a shortcut to refer to the current package in the name of a `\hook` and in a `\label`. If the `\hook` name or the `\label` consist just of a single dot (.), or starts with a dot followed by a slash (./) then the dot denotes the `\default label` (usually the current package or class name—see `\SetDefaultHookLabel`). A “.” or “./” anywhere else in a `\hook` or in `\label` is treated literally and is not replaced.

For example, inside the package `mypackage.sty`, the default label is `mypackage`, so the instructions:

```
\NewHook  {./hook}
\AddToHook {./hook}[]{}{code}      % Same as \AddToHook{./hook}{code}
\AddToHook {./hook}[/sub]{}{code}
\DeclareHookRule{begindocument}{}{before}{babel}
\AddToHook {file/foo.tex/after}{}{code}
```

are equivalent to:

```
\NewHook  {mymodule/hook}
\AddToHook {mymodule/hook}[mymodule]{code}
\AddToHook {mymodule/hook}[mymodule/sub]{}{code}
\DeclareHookRule{begindocument}{mymodule}{before}{babel}
\AddToHook {file/foo.tex/after}{}{code}           % unchanged
```

The `\default label` is automatically set equal to the name of the current package or class at the time the package is loaded. If the hook command is used outside of a package, or the current file wasn't loaded with `\usepackage` or `\documentclass`, then the top-level is used as the `\default label`. This may have exceptions—see `\PushDefaultHookLabel`.

Important:
The dot-syntax is **not** available with \UseHook and some other commands that are typically used within code!

This syntax is available in all `\label` arguments and most `\hook` arguments, both in the L^AT_EX 2_< interface, and the L^AT_EX3 interface described in section 2.2.

Note, however, that the replacement of `.` by the `\defaultLabel` takes place when the hook command is executed, so actions that are somehow executed after the package ends will have the wrong `\defaultLabel` if the dot-syntax is used. For that reason, this syntax is not available in `\UseHook` (and `\hook_use:n`) because the hook is most of the time used outside of the package file in which it was defined. This syntax is also not available in the hook conditionals `\IfHookEmptyTF` (and `\hook_if_empty:nTF`), because these conditionals are used in some performance-critical parts of the hook management code, and because they are usually used to refer to other package's hooks, so the dot-syntax doesn't make much sense.

In some cases, for example in large packages, one may want to separate the code in logical parts, but still use the main package name as the `\label`, then the `\defaultLabel` can be set using `\PushDefaultHookLabel{...} ... \PopDefaultHookLabel` or `\SetDefaultHookLabel{...}`.

```
\PushDefaultHookLabel \PushDefaultHookLabel {\defaultLabel}
                                {code}
\PopDefaultHookLabel
```

`\PushDefaultHookLabel` sets the current `\defaultLabel` to be used in `\label` arguments, or when replacing a leading `."` (see above). `\PopDefaultHookLabel` reverts the `\defaultLabel` to its previous value.

Inside a package or class, the `\defaultLabel` is equal to the package or class name, unless explicitly changed. Everywhere else, the `\defaultLabel` is top-level (see section 2.1.6) unless explicitly changed.

The effect of `\PushDefaultHookLabel` holds until the next `\PopDefaultHookLabel`. `\usepackage` (and `\RequirePackage` and `\documentclass`) internally use

```
\PushDefaultHookLabel{\packageName}
                        {package code}
\PopDefaultHookLabel
```

to set the `\defaultLabel` for the package or class file. Inside the `{package code}` the `\defaultLabel` can also be changed with `\SetDefaultHookLabel`. `\input` and other file input-related commands from the L^AT_EX kernel do not use `\PushDefaultHookLabel`, so code within files loaded by these commands does *not* get a dedicated `\label`! (that is, the `\defaultLabel` is the current active one when the file was loaded.)

Packages that provide their own package-like interfaces (TikZ's `\usetikzlibrary`, for example) can use `\PushDefaultHookLabel` and `\PopDefaultHookLabel` to set dedicated labels and to emulate `\usepackage`-like hook behavior within those contexts.

The **top-level** label is treated differently, and is reserved to the user document, so it is not allowed to change the `\defaultLabel` to **top-level**.

```
\SetDefaultHookLabel \SetDefaultHookLabel {<default label>}
```

Similarly to `\PushDefaultHookLabel`, sets the current `<default label>` to be used in `<label>` arguments, or when replacing a leading “.”. The effect holds until the label is changed again or until the next `\PopDefaultHookLabel`. The difference between `\PushDefaultHookLabel` and `\SetDefaultHookLabel` is that the latter does not save the current `<default label>`.

This command is useful when a large package is composed of several smaller packages, but all should have the same `<label>`, so `\SetDefaultHookLabel` can be used at the beginning of each package file to set the correct label.

`\SetDefaultHookLabel` is not allowed in the main document, where the `<default label>` is **top-level** and there is no `\PopDefaultHookLabel` to end its effect. It is also not allowed to change the `<default label>` to **top-level**.

2.1.6 The top-level label

The **top-level** label, assigned to code added from the main document, is different from other labels. Code added to hooks (usually `\AtBeginDocument`) in the preamble is almost always to change something defined by a package, so it should go at the very end of the hook.

Therefore, code added in the **top-level** is always executed at the end of the hook, regardless of where it was declared. If the hook is reversed (see `\NewReversedHook`), the **top-level** chunk is executed at the very beginning instead.

Rules regarding **top-level** have no effect: if a user wants to have a specific set of rules for a code chunk, they should use a different label to said code chunk, and provide a rule for that label instead.

The **top-level** label is exclusive for the user, so trying to add code with that label from a package results in an error.

2.1.7 Defining relations between hook code

The default assumption is that code added to hooks by different packages are independent and the order in which they are executed is irrelevant. While this is true in many cases it is obviously false in others.

Before the hook management system was introduced packages had to take elaborate precautions to determine whether some other package had also been loaded (before or after) and then to find some ways to alter its behavior accordingly. In addition it was often the user’s responsibility to load packages in the right order so that alterations made by packages were done in that same order; and in some cases even altering the loading order wouldn’t resolve the conflicts.

With the new hook management system it is now possible to define rules (i.e., relationships) between code chunks added by different packages and to specify explicitly the order in which they should be processed.

The rules can be declared for hooks before the hook has been declared with `\NewHook` and they are allowed to refer to code labels that do not yet exist, e.g., because a package defining the code chunk with that label has not yet been loaded. When the hook code is finally sorted for fast execution, all rules that apply are acted on and the others are ignored.

This offers the flexibility needed to handle complicated relationships between code from different packages and to set this up beforehand in a way that is independent of whether or not the packages are actually loaded in a specific document. The downside

of this is that misspellings of hook names or code labels will not raise any error, instead the rule will simply never apply!

`\DeclareHookRule \DeclareHookRule {\hook} {\label1} {\relation} {\label2}`

Defines a relation between `\label1` and `\label2` for a given `\hook`. If `\hook` is ?? this defines a default relation for all hooks that use the two labels, i.e., that have chunks of code labeled with `\label1` and `\label2`.

Currently, the supported relations are the following:

`before` or < Code for `\label1` comes before code for `\label2`.

`after` or > Code for `\label1` comes after code for `\label2`.

`incompatible-warning` Only code for either `\label1` or `\label2` can appear for that hook (a way to say that two packages—or parts of them—are incompatible). A warning is raised if both labels appear in the same hook.

`incompatible-error` Like `incompatible-warning` but instead of a warning a L^AT_EX error is raised, and the code for both labels are dropped from that hook until the conflict is resolved.

`voids` Code for `\label1` overwrites code for `\label2`. More precisely, code for `\label2` is dropped for that hook. This can be used, for example if one package is a superset in functionality of another one and therefore wants to undo code in some hook and replace it with its own version.

`unrelated` The order of code for `\label1` and `\label2` is irrelevant. This rule is there to undo an incorrect rule specified earlier.

There can only be a single relation between two labels for a given hook, i.e., a later `\DeclareHookRule` overwrites any previous declaration. In all cases rules specific to a given hook take precedence over default rules that use ?? as the `\hook`.

If a default rule is applied, it is done before reversing the label order in a reversed hook, e.g., `before` in a default rule effectively becomes `after` in such a hook. In contrast, a rule for a specific hook is always applied to the state after any reversal (i.e., the state you see when using `\ShowHook` on that hook).

The `\hook` and `\label` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\ClearHookRule \ClearHookRule {\hook} {\label1} {\label2}`

Syntactic sugar for saying that `\label1` and `\label2` are unrelated for the given `\hook`.

```
\DeclareDefaultHookRule \DeclareDefaultHookRule {\langle label1\rangle} {\langle relation\rangle} {\langle label2\rangle}
```

This sets up a relation between `\langle label1\rangle` and `\langle label2\rangle` for all hooks unless overwritten by a specific rule for a hook. Useful for cases where one package has a specific relation to some other package, e.g., is `incompatible` or always needs a special ordering `before` or `after`. (Technically it is just a shorthand for using `\DeclareHookRule` with `??` as the hook name.)

If such a rule is applied to a reversed hook it behaves as if the rule is reversed (e.g., `after` becomes `before`) because those rules are applied first and then the order is reversed. The rationale is that in hook pairs (in which the ordering in one is reversed) default rules have to be reversed too in nearly all scenarios. If this is not the case, a default rule can't be used or has to be overwritten with an explicit `\DeclareHookRule` for that specific hook.

Declaring default rules is only supported in the document preamble.⁵

The `\langle label\rangle` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

2.1.8 Querying hooks

Simpler data types, like token lists, have three possible states; they can:

- exist and be empty;
- exist and be non-empty; and
- not exist (in which case emptiness doesn't apply);

Hooks are a bit more complicated: a hook may exist or not, and independently it may or may not be empty. This means that even a hook that doesn't exist may be non-empty and it can also be disabled.

This seemingly strange state may happen when, for example, package *A* defines hook `A/foo`, and package *B* adds some code to that hook. However, a document may load package *B* before package *A*, or may not load package *A* at all. In both cases some code is added to hook `A/foo` without that hook being defined yet, thus that hook is said to be non-empty, whereas it doesn't exist. Therefore, querying the existence of a hook doesn't imply its emptiness, neither does the other way around.

Given that code or rules can be added to a hook even if it doesn't physically exist yet, means that a querying its existence has no real use case (in contrast to other variables that can only be update if they have already been declared). For that reason only the test for emptiness has a public interface.

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its “next” token list. The hook doesn't need to be declared to have code added to its code pool. A hook is said to exist when it was declared with `\NewHook` or some variant thereof. Generic hooks such as `file` and `env` hooks are automatically declared when code is added to them.

⁵Trying to do so, e.g., via `\DeclareHookRule` with `??` has bad side-effects and is not supported (though not explicitly caught for performance reasons).

\IfHookEmptyTF * \IfHookEmptyTF {\hook} {\truecode} {\falsecode}
\IfHookEmptyT * Tests if the `\hook` is empty (*i.e.*, no code was added to it using either `\AddToHook` or `\AddToHookNext`) or such code was removed again (via `\RemoveFromHook`), and branches to either `\truecode` or `\falsecode` depending on the result.
The `\hook` cannot be specified using the dot-syntax. A leading `.` is treated literally.

2.1.9 Displaying hook code

If one has to adjust the code execution in a hook using a hook rule it is helpful to get some information about the code associated with a hook, its current order and the existing rules.

\ShowHook \ShowHook {\hook}
\LogHook \LogHook {\hook}

Displays information about the `\hook` such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

`\LogHook` prints the information to the `.log` file, and `\ShowHook` prints them to the terminal/command window and starts TeX's prompt (only in `\errorstopmode`) to wait for user action.

The `\hook` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

Suppose a hook `example-hook` whose output of `\ShowHook{example-hook}` is:

```
1  -> The hook 'example-hook':  
2  > Code chunks:  
3  >     foo -> [code from package 'foo']  
4  >     bar -> [from package 'bar']  
5  >     baz -> [package 'baz' is here]  
6  > Document-level (top-level) code (executed last):  
7  >     -> [code from 'top-level']  
8  > Extra code for next invocation:  
9  >     -> [one-time code]  
10 > Rules:  
11 >     foo|baz with relation >  
12 >     baz|bar with default relation <  
13 > Execution order (after applying rules):  
14 >     baz, foo, bar.
```

In the listing above, lines 3 to 5 show the three code chunks added to the hook and their respective labels in the format

`<label> -> <code>`

Line 7 shows the code chunk added by the user in the main document (labeled **top-level**) in the format

```
Document-level (top-level) code (executed <first/last>):
-> <top-level code>
```

This code will be either the first or last code executed by the hook (**last** if the hook is normal, **first** if it is reversed). This chunk is not affected by rules and does not take part in sorting.

Line 9 shows the code chunk for the next execution of the hook in the format

```
-> <next-code>
```

This code will be used and disappear at the next `\UseHook{example-hook}`, in contrast to the chunks mentioned earlier, which can only be removed from that hook by doing `\RemoveFromHook{label}{example-hook}`.

Lines 11 and 12 show the rules declared that affect this hook in the format

```
<label-1>|<label-2> with <default?> relation <relation>
```

which means that the **<relation>** applies to **<label-1>** and **<label-2>**, in that order, as detailed in `\DeclareHookRule`. If the relation is **default** it means that this rule applies to **<label-1>** and **<label-2>** in *all* hooks, (unless overridden by a non-default relation).

Finally, line 14 lists the labels in the hook after sorting; that is, in the order they will be executed when the hook is used.

2.1.10 Debugging hook code

<code>\DebugHooksOn</code>	<code>\DebugHooksOn ... \DebugHooksOff</code>
<code>\DebugHooksOff</code>	

Turn the debugging of hook code on or off. This displays most changes made to the hook data structures. The output is rather coarse and not really intended for normal use, but it can be helpful in case hooks do not work as expected. See also 2.1.9 for commands to inspect individual hooks.

2.2 L3 programming layer (`expl3`) interfaces

This is a quick summary of the L^AT_EX3 programming interfaces for use with packages written in `expl3`. In contrast to the L^AT_EX 2_E interfaces they always use mandatory arguments only, e.g., you always have to specify the **<label>** for a code chunk. We therefore suggest to use the declarations discussed in the previous section even in `expl3` packages, but the choice is yours.

<code>\hook_new:n</code>	<code>\hook_new:n {<hook>}</code>
<code>\hook_new_reversed:n</code>	<code>\hook_new_reversed:n {<hook>}</code>
<code>\hook_new_pair:nn</code>	<code>\hook_new_pair:nn {<hook-1>} {<hook-2>}</code>

Creates a new **<hook>** with normal or reverse ordering of code chunks. `\hook_new_-pair:nn` creates a pair of such hooks with `{<hook-2>}` being a reversed hook. If a hook name is already taken, an error is raised and the hook is not created.

The **<hook>** can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\hook_new_with_args:nn      \hook_new_with_args:nn {⟨hook⟩} {⟨number⟩}
\hook_new_reversed_with_args:nn \hook_new_reversed_with_args:nn {⟨hook⟩} {⟨number⟩}
\hook_new_pair_with_args:nnn \hook_new_pair_with_args:nnn {⟨hook-1⟩} {⟨hook-2⟩} {⟨number⟩}
```

New: 2023-06-01

Creates a new ⟨hook⟩ with normal or reverse ordering of code chunks, that takes ⟨number⟩ arguments from the input stream when it is used. \hook_new_pair_with_args:nn creates a pair of such hooks with {⟨hook-2⟩} being a reversed hook. If a hook name is already taken, an error is raised and the hook is not created.

The ⟨hook⟩ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\hook_disable_generic:n \hook_disable_generic:n {⟨hook⟩}
```

Marks {⟨hook⟩} as disabled. Any further attempt to add code to it or declare it, will result in an error and any call to \hook_use:n will simply do nothing.

This declaration is intended for use with generic hooks that are known not to work (see `lcmdhooks-doc`) if they receive code.

The ⟨hook⟩ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\hook_activate_generic:n \hook_activate_generic:n {⟨hook⟩}
```

This is like \hook_new:n but it does nothing if the hook was previously declared with \hook_new:n. This declaration should be used only in special situations, e.g., when a command from another package needs to be altered and it is not clear whether a generic cmd hook (for that command) has been previously explicitly declared.

Normally \hook_new:n should be used instead of this.

```
\hook_use:n \hook_use:n {⟨hook⟩}
```

```
\hook_use:nnw \hook_use:nnw {⟨hook⟩} {⟨number⟩} {⟨arg1⟩} ... {⟨argn⟩}
```

New: 2023-06-01 Executes the {⟨hook⟩} code followed (if set up) by the code for next invocation only, then empties that next invocation code. \hook_use:nnw should be used for hooks declared with arguments, and should be followed by as many brace groups as the declared number of arguments. The ⟨number⟩ should be the number of arguments declared for the hook. If the hook is not declared, this command does nothing and it will remove ⟨number⟩ items from the input.

The ⟨hook⟩ *cannot* be specified using the dot-syntax. A leading . is treated literally.

```
\hook_use_once:n \hook_use_once:n {⟨hook⟩}
```

```
\hook_use_once:nnw \hook_use_once:nnw {⟨hook⟩} {⟨number⟩} {⟨arg1⟩} ... {⟨argn⟩}
```

New: 2023-06-01 Changes the {⟨hook⟩} status so that from now on any addition to the hook code is executed immediately. Then execute any {⟨hook⟩} code already set up. \hook_use_once:nnw should be used for hooks declared with arguments, and should be followed by as many brace groups as the declared number of arguments. The ⟨number⟩ should be the number of arguments declared for the hook. If the hook is not declared, this command does nothing and it will remove ⟨number⟩ items from the input.

The ⟨hook⟩ *cannot* be specified using the dot-syntax. A leading . is treated literally.

\hook_gput_code:nnn \hook_gput_code:nnn {\hook} {\label} {\code}

\hook_gput_code_with_args:nnn \hook_gput_code_with_args:nnn {\hook} {\label} {\code}

New: 2023-06-01

Adds a chunk of `{code}` to the `{hook}` labeled `{label}`. If the label already exists the `{code}` is appended to the already existing code.

If `\hook_gput_code_with_args:nnn` is used, the `{code}` can access the arguments passed to `\hook_use:nnw` (or `\hook_use_once:nnw`) with #1, #2, ..., #n (up to the number of arguments declared for the hook). In that case, if an actual parameter token should be added to the code, it should be doubled.

If code is added to an external `{hook}` (of the kernel or another package) then the convention is to use the package name as the `{label}` not some internal module name or some other arbitrary string.

The `{hook}` and `{label}` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

\hook_gput_next_code:nn \hook_gput_next_code:nn {\hook} {\code}

\hook_gput_next_code_with_args:nn \hook_gput_next_code_with_args:nn {\hook} {\code}

New: 2023-06-01

Adds a chunk of `{code}` for use only in the next invocation of the `{hook}`. Once used it is gone.

If `\hook_gput_next_code_with_args:nn` is used, the `{code}` can access the arguments passed to `\hook_use:nnw` (or `\hook_use_once:nnw`) with #1, #2, ..., #n (up to the number of arguments declared for the hook). In that case, if an actual parameter token should be added to the code, it should be doubled.

This is simpler than `\hook_gput_code:nnn`, the code is simply appended to the hook in the order of declaration at the very end, i.e., after all standard code for the hook got executed. Thus if one needs to undo what the standard does one has to do that as part of `{code}`.

The `{hook}` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

\hook_gclear_next_code:n \hook_gclear_next_code:n {\hook}

Undo any earlier `\hook_gput_next_code:nn`.

\hook_gremove_code:nn \hook_gremove_code:nn {\hook} {\label}

Removes any code for `{hook}` labeled `{label}`.

If there is no code under the `{label}` in the `{hook}`, or if the `{hook}` does not exist, a warning is issued when you attempt to use `\hook_gremove_code:nn`, and the command is ignored.

If the second argument is *, then all code chunks are removed. This is rather dangerous as it drops code from other packages one may not know about, so think twice before using that!

The `{hook}` and `{label}` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\hook_gset_rule:nnnn \hook_gset_rule:nnnn {<hook>} {<label1>} {<relation>} {<label2>}
```

Relate *<label1>* with *<label2>* when used in *<hook>*. See `\DeclareHookRule` for the allowed *<relation>*s. If *<hook>* is ?? a default rule is specified.

The *<hook>* and *<label>* can be specified using the dot-syntax to denote the current package name. See section 2.1.5. The dot-syntax is parsed in both *<label>* arguments, but it usually makes sense to be used in only one of them.

```
\hook_if_empty_p:n * \hook_if_empty:nTF {<hook>} {<true code>} {<false code>}
```

`\hook_if_empty:nTF *` Tests if the *<hook>* is empty (*i.e.*, no code was added to it using either `\AddToHook` or `\AddToHookNext`), and branches to either *<true code>* or *<false code>* depending on the result.

The *<hook>* cannot be specified using the dot-syntax. A leading . is treated literally.

```
\hook_show:n \hook_show:n {<hook>}
```

```
\hook_log:n \hook_log:n {<hook>}
```

Displays information about the *<hook>* such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

`\hook_log:n` prints the information to the .log file, and `\hook_show:n` prints them to the terminal/command window and starts TeX's prompt (only if `\errorstopmode`) to wait for user action.

The *<hook>* can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\hook_debug_on: \hook_debug_on:
```

`\hook_debug_off:` Turns the debugging of hook code on or off. This displays changes to the hook data.

2.3 On the order of hook code execution

Chunks of code for a *<hook>* under different labels are supposed to be independent if there are no special rules set up that define a relation between the chunks. This means that you can't make assumptions about the order of execution!

Suppose you have the following declarations:

```
\NewHook{myhook}
\AddToHook{myhook}[packageA]{\typeout{A}}
\AddToHook{myhook}[packageB]{\typeout{B}}
\AddToHook{myhook}[packageC]{\typeout{C}}
```

then executing the hook with `\UseHook` will produce the typeout A B C in that order. In other words, the execution order is computed to be packageA, packageB, packageC which you can verify with `\ShowHook{myhook}`:

```

-> The hook 'myhook':
> Code chunks:
>   packageA -> \typeout {A}
>   packageB -> \typeout {B}
>   packageC -> \typeout {C}
> Document-level (top-level) code (executed last):
>   ---
> Extra code for next invocation:
>   ---
> Rules:
>   ---
> Execution order:
>   packageA, packageB, packageC.

```

The reason is that the code chunks are internally saved in a property list and the initial order of such a property list is the order in which key-value pairs got added. However, that is only true if nothing other than adding happens!

Suppose, for example, you want to replace the code chunk for `packageA`, e.g.,

```
\RemoveFromHook{myhook}[packageA]
\AddToHook{myhook}[packageA]{\typeout{A alt}}
```

then your order becomes `packageB`, `packageC`, `packageA` because the label got removed from the property list and then re-added (at its end).

While that may not be too surprising, the execution order is also sometimes altered if you add a redundant rule, e.g. if you specify

```
\DeclareHookRule{myhook}{packageA}{before}{packageB}
```

instead of the previous lines we get

```

-> The hook 'myhook':
> Code chunks:
>   packageA -> \typeout {A}
>   packageB -> \typeout {B}
>   packageC -> \typeout {C}
> Document-level (top-level) code (executed last):
>   ---
> Extra code for next invocation:
>   ---
> Rules:
>   packageB|packageA with relation >
> Execution order (after applying rules):
>   packageA, packageC, packageB.

```

As you can see the code chunks are still in the same order, but in the execution order for the labels `packageB` and `packageC` have swapped places. The reason is that, with the rule there are two orders that satisfy it, and the algorithm for sorting happened to pick a different one compared to the case without rules (where it doesn't run at all as there is nothing to resolve). Incidentally, if we had instead specified the redundant rule

```
\DeclareHookRule{myhook}{packageB}{before}{packageC}
```

the execution order would not have changed.

In summary: it is not possible to rely on the order of execution unless there are rules that partially or fully define the order (in which you can rely on them being fulfilled).

2.4 The use of “reversed” hooks

You may have wondered why you can declare a “reversed” hook with `\NewReversedHook` and what that does exactly.

In short: the execution order of a reversed hook (without any rules!) is exactly reversed to the order you would have gotten for a hook declared with `\NewHook`.

This is helpful if you have a pair of hooks where you expect to see code added that involves grouping, e.g., starting an environment in the first and closing that environment in the second hook. To give a somewhat contrived example⁶, suppose there is a package adding the following:

```
\AddToHook{env/quote/before}[package-1]{\begin{itshape}}
\AddToHook{env/quote/after} [package-1]{\end{itshape}}
```

As a result, all quotes will be in italics. Now suppose further that another `package-too` makes the quotes also in blue and therefore adds:

```
\usepackage{color}
\AddToHook{env/quote/before}[package-too]{\begin{color}{blue}}
\AddToHook{env/quote/after} [package-too]{\end{color}}
```

Now if the `env/quote/after` hook would be a normal hook we would get the same execution order in both hooks, namely:

`package-1, package-too`

(or vice versa) and as a result, would get:

```
\begin{itshape}\begin{color}{blue} ...
\end{itshape}\end{color}
```

and an error message saying that `\begin{color}` was ended by `\end{itshape}`. With `env/quote/after` declared as a reversed hook the execution order is reversed and so all environments are closed in the correct sequence and `\ShowHook` would give us the following output:

```
-> The hook 'env/quote/after':
> Code chunks:
>     package-1 -> \end {itshape}
>     package-too -> \end {color}
> Document-level (top-level) code (executed first):
>     ---
> Extra code for next invocation:
>     ---
> Rules:
>     ---
> Execution order (after reversal):
>     package-too, package-1.
```

If there is a matching default rule (done with `\DeclareDefaultHookRule` or with `??` for the hook name) then this default rule is applied before the reversal so that the order in the reversed hook mirrors the one in the normal hook. However, all rules specific to a hook happen always after the reversal of the execution order, so if you alter the order you will probably have to alter it in both hooks, not just in one, but that depends on the use case.

⁶There are simpler ways to achieve the same effect.

2.5 Difference between “normal” and “one-time” hooks

When executing a hook a developer has the choice of using either `\UseHook` or `\UseOneTimeHook` (or their `expl3` equivalents `\hook_use:n` and `\hook_use_once:n`). This choice affects how `\AddToHook` is handled after the hook has been executed for the first time.

With normal hooks adding code via `\AddToHook` means that the code chunk is added to the hook data structure and then used each time `\UseHook` is called.

With one-time hooks it this is handled slightly differently: After `\UseOneTimeHook` has been called, any further attempts to add code to the hook via `\AddToHook` will simply execute the `\langle code \rangle` immediately.

This has some consequences one needs to be aware of:

- If `\langle code \rangle` is added to a normal hook after the hook was executed and it is never executed again for one or the other reason, then this new `\langle code \rangle` will never be executed.
- In contrast if that happens with a one-time hook the `\langle code \rangle` is executed immediately.

In particular this means that construct such as

```
\AddToHook{myhook}
{ \langle code-1 \rangle \AddToHook{myhook}{\langle code-2 \rangle} \langle code-3 \rangle }
```

works for one-time hooks⁷ (all three code chunks are executed one after another), but it makes little sense with a normal hook, because with a normal hook the first time `\UseHook{myhook}` is executed it would

- execute `\langle code-1 \rangle`,
- then execute `\AddToHook{myhook}{code-2}` which adds the code chunk `\langle code-2 \rangle` to the hook for use on the next invocation,
- and finally execute `\langle code-3 \rangle`.

The second time `\UseHook` is called it would execute the above and in addition `\langle code-2 \rangle` as that was added as a code chunk to the hook in the meantime. So each time the hook is used another copy of `\langle code-2 \rangle` is added and so that code chunk is executed `\langle \# of invocations \rangle - 1` times.

2.6 Generic hooks provided by packages

The hook management system also implements a category of hooks that are called “Generic Hooks”. Normally a hook has to be explicitly declared before it can be used in code. This ensures that different packages are not using the same hook name for unrelated purposes—something that would result in absolute chaos. However, there are a number of “standard” hooks where it is unreasonable to declare them beforehand, e.g., each and every command has (in theory) an associated `before` and `after` hook. In such cases, i.e., for command, environment or file hooks, they can be used simply by adding code to them with `\AddToHook`. For more specialized generic hooks, e.g., those provided

⁷This is sometimes used with `\AtBeginDocument` which is why it is supported.

by `babel`, you have to additionally enable them with `\ActivateGenericHook` as explained below.

The generic hooks provided by L^AT_EX are those for `cmd`, `env`, `file`, `include`, `package`, and `class`, and all these are available out of the box: you only have to use `\AddToHook` to add code to them, but you don't have to add `\UseHook` or `\UseOneTimeHook` to your code, because this is already done for you (or, in the case of `cmd` hooks, the command's code is patched at `\begin{document}`, if necessary).

However, if you want to provide further generic hooks in your own code, the situation is slightly different. To do this you should use `\UseHook` or `\UseOneTimeHook`, but *without declaring the hook* with `\NewHook`. As mentioned earlier, a call to `\UseHook` with an undeclared hook name does nothing. So as an additional setup step, you need to explicitly activate your generic hook. Note that a generic hook produced in this way is always a normal hook.

For a truly generic hook, with a variable part in the hook name, such upfront activation would be difficult or impossible, because you typically do not know what kind of variable parts may come up in real documents.

For example, `babel` provides hooks such as `babel/(language)/afterextras`. However, language support in `babel` is often done through external language packages. Thus doing the activation for all languages inside the core `babel` code is not a viable approach. Instead it needs to be done by each language package (or by the user who wants to use a particular hook).

Because the hooks are not declared with `\NewHook` their names should be carefully chosen to ensure that they are (likely to be) unique. Best practice is to include the package or command name, as was done in the `babel` example above.

Generic hooks defined in this way are always normal hooks (i.e., you can't implement reversed hooks this way). This is a deliberate limitation, because it speeds up the processing considerably.

2.7 Hooks with arguments

Sometimes it is necessary to pass contextual information to a hook, and, for one reason or another, it is not feasible to store such information in macros. To serve this purpose, hooks can be declared with arguments, so that the programmer can pass along the data necessary for the code in the hook to function properly.

A hook with arguments works mostly like a regular hook, and most commands that work for regular hooks, also work for hooks that take arguments. The differences are when the hook is declared (`\NewHookWithArguments` is used instead of `\NewHook`), then code can be added with both `\AddToHook` and `\AddToHookWithArguments`, and when the hook is used (`\UseHookWithArguments` instead of `\UseHook`).

A hook with arguments must be declared as such (before it is first used, as all regular hooks) using `\NewHookWithArguments{(hook)}{(number)}`. All code added to that hook can then use #1 to access the first argument, #2 to access the second, and so forth up to the number of arguments declared. However, it is still possible to add code with references to the arguments of a hook that was not yet declared (we will discuss that later). At their core, hooks are macros, so T_EX's limit of 9 arguments applies, and a low-level T_EX error is raised if you try to reference an argument number that doesn't exist.

To use a hook with arguments, just write `\UseHookWithArguments{⟨hook⟩}{⟨number⟩}` followed by a braced list of the arguments. For example, if the hook `test` takes three arguments, write:

```
\UseHookWithArguments{test}{3}{arg-1}{arg-2}{arg-3}
```

then, in the `⟨code⟩` of the hook, all instances of `#1` will be replaced by `arg-1`, `#2` by `arg-2` and so on. If, at the point of usage, the programmer provides more arguments than the hook is declared to take, the excess arguments are simply ignored by the hook. Behavior is unpredictable⁸ if too few arguments are provided. If the hook isn't declared, `⟨number⟩` arguments are removed from the input stream.

Adding code to a hook with arguments can be done with `\AddToHookWithArguments` as well as with the regular `\AddToHook`, to achieve different outcomes. The main difference when it comes to adding code to a hook, in this case, is firstly the possibility of accessing a hook's arguments, of course, and second, how parameter tokens (`#6`) are treated.

Using `\AddToHook` in a hook that takes arguments will work as it does for all other hooks. This allows a package developer to add arguments to a hook that otherwise had none without having to worry about compatibility. This means that, for example:

```
\AddToHook{test}{\def\foo#1{Hello, #1!}}
```

will define the same macro `\foo` regardless if the hook `test` takes arguments or not.

Using `\AddToHookWithArguments` allows the `⟨code⟩` added to access the arguments of the hook with `#1`, `#2`, and so forth, up to the number of the arguments declared in the hook. This means that if one wants to add a `#6` to the `⟨code⟩` that token must be doubled in the input. The same definition from above, using `\AddToHookWithArguments`, needs to be rewritten:

```
\AddToHookWithArguments{test}{\def\foo##1{Hello, ##1!}}
```

Extending the above example to use the hook arguments, we could rewrite something like (now from declaration to usage, to get the whole picture):

```
\NewHookWithArguments{test}{1}
\AddToHookWithArguments{test}{%
  \typeout{Defining foo with "#1"}
  \def\foo##1{Hello, ##1! Some text after: #1}%
}
\UseHook{test}{Howdy!}
>ShowCommand\foo
```

Running the code above prints in the terminal:

```
Defining foo with "Howdy!"
> \foo=macro:
#1->Hello, #1! Some text after: Howdy!.
```

⁸The hook *will* take the declared number of arguments, and what will happen depends on what was grabbed, and what the hook code does with its arguments.

Note how `##1` in the call to `\AddToHookWithArguments` became `#1`, and the `#1` was replaced by the argument passed to the hook. Should the hook be used again, with a different argument, the definition would naturally change.

It is possible to add code referencing a hook’s arguments before such hook is declared and the number of hooks is fixed. However, if some code is added to the hook, that references more arguments than will be declared for the hook, there will be a low-level TeX error about an “Illegal parameter number” at the time the hook is declared, which will be hard to track down because at that point TeX can’t know whence the offending code came from. Thus it is important that package writers explicitly document how many arguments (if any) each hook can take, so users of those packages know how many arguments can be referenced, and equally important, what each argument means.

2.8 Private L^AT_EX kernel hooks

There are a few places where it is absolutely essential for L^AT_EX to function correctly that code is executed in a precisely defined order. Even that could have been implemented with the hook management (by adding various rules to ensure the appropriate ordering with respect to other code added by packages). However, this makes every document unnecessary slow, because there has to be sorting even though the result is predetermined. Furthermore it forces package writers to unnecessarily add such rules if they add further code to the hook (or break L^AT_EX).

For that reason such code is not using the hook management, but instead private kernel commands directly before or after a public hook with the following naming convention: `\@kernel@before@<hook>` or `\@kernel@after@<hook>`. For example, in `\enddocument` you find

```
\UseHook{enddocument}%
\@kernel@after@enddocument
```

which means first the user/package-accessible `enddocument` hook is executed and then the internal kernel hook. As their name indicates these kernel commands should not be altered by third-party packages, so please refrain from that in the interest of stability and instead use the public hook next to it.⁹

2.9 Legacy L^AT_EX 2_ε interfaces

L^AT_EX 2_ε offered a small number of hooks together with commands to add to them. They are listed here and are retained for backwards compatibility.

With the new hook management, several additional hooks have been added to L^AT_EX and more will follow. See the next section for what is already available.

⁹As with everything in TeX there is not enforcement of this rule, and by looking at the code it is easy to find out how the kernel adds to them. The main reason of this section is therefore to say “please don’t do that, this is unconfigurable code!”

```
\AtBeginDocument \AtBeginDocument [⟨label⟩] {⟨code⟩}
```

If used without the optional argument ⟨label⟩, it works essentially like before, i.e., it is adding ⟨code⟩ to the hook `begindocument` (which is executed inside `\begin{document}`). However, all code added this way is labeled with the label `top-level` (see section 2.1.6) if done outside of a package or class or with the package/class name if called inside such a file (see section 2.1.5).

This way one can add code to the hook using `\AddToHook` or `\AtBeginDocument` using a different label and explicitly order the code chunks as necessary, e.g., run some code before or after another package's code. When using the optional argument the call is equivalent to running `\AddToHook {begindocument} [⟨label⟩] {⟨code⟩}`.

`\AtBeginDocument` is a wrapper around the `begindocument` hook (see section 3.2), which is a one-time hook. As such, after the `begindocument` hook is executed at `\begin{document}` any attempt to add ⟨code⟩ to this hook with `\AtBeginDocument` or with `\AddToHook` will cause that ⟨code⟩ to execute immediately instead. See section 2.5 for more on one-time hooks.

For important packages with known order requirement we may over time add rules to the kernel (or to those packages) so that they work regardless of the loading-order in the document.

```
\AtEndDocument \AtEndDocument [⟨label⟩] {⟨code⟩}
```

Like `\AtBeginDocument` but for the `enddocument` hook.

The few hooks that existed previously in L^AT_EX 2_ε used internally commands such as `\@begindocumenthook` and packages sometimes augmented them directly rather than working through `\AtBeginDocument`. For that reason there is currently support for this, that is, if the system detects that such an internal legacy hook command contains code it adds it to the new hook system under the label `legacy` so that it doesn't get lost.

However, over time the remaining cases of direct usage need updating because in one of the future release of L^AT_EX we will turn this legacy support off, as it does unnecessary slow down the processing.

3 L^AT_EX 2_ε commands and environments augmented by hooks

In this section we describe the standard hooks that are now offered by L^AT_EX, or give pointers to other documents in which they are described. This section will grow over time (and perhaps eventually move to usrguide3).

3.1 Generic hooks

As stated earlier, with the exception of generic hooks, all hooks must be declared with `\NewHook` before they can be used. All generic hooks have names of the form “⟨type⟩/⟨name⟩/⟨position⟩”, where ⟨type⟩ is from the predefined list shown below, and ⟨name⟩ is the variable part whose meaning will depend on the ⟨type⟩. The last component, ⟨position⟩, has more complex possibilities: it can always be `before` or `after`; for `env` hooks, it can also be `begin` or `end`; and for `include` hooks it can also be `end`. Each specific hook is documented below, or in `ltcmdhooks-doc.pdf` or `ltfilehook-doc.pdf`.

The generic hooks provided by L^AT_EX belong to one of the six types:

env Hooks executed before and after environments – $\langle \text{name} \rangle$ is the name of the environment, and available values for $\langle \text{position} \rangle$ are **before**, **begin**, **end**, and **after**;

cmd Hooks added to and executed before and after commands – $\langle \text{name} \rangle$ is the name of the command, and available values for $\langle \text{position} \rangle$ are **before** and **after**;

file Hooks executed before and after reading a file – $\langle \text{name} \rangle$ is the name of the file (with extension), and available values for $\langle \text{position} \rangle$ are **before** and **after**;

package Hooks executed before and after loading packages – $\langle \text{name} \rangle$ is the name of the package, and available values for $\langle \text{position} \rangle$ are **before** and **after**;

class Hooks executed before and after loading classes – $\langle \text{name} \rangle$ is the name of the class, and available values for $\langle \text{position} \rangle$ are **before** and **after**;

include Hooks executed before and after \included files – $\langle \text{name} \rangle$ is the name of the included file (without the .tex extension), and available values for $\langle \text{position} \rangle$ are **before**, **end**, and **after**.

Each of the hooks above are detailed in the following sections and in linked documentation.

3.1.1 Generic hooks for all environments

Every environment $\langle \text{env} \rangle$ has now four associated hooks coming with it:

env/⟨env⟩/before This hook is executed as part of \begin as the very first action, in particular prior to starting the environment group. Its scope is therefore not restricted by the environment.

env/⟨env⟩/begin This hook is executed as part of \begin directly in front of the code specific to the environment start (e.g., the third argument of \NewDocumentEnvironment and the second argument of \newenvironment). Its scope is the environment body.

env/⟨env⟩/end This hook is executed as part of \end directly in front of the code specific to the end of the environment (e.g., the forth argument of \NewDocumentEnvironment and the third argument of \newenvironment).

env/⟨env⟩/after This hook is executed as part of \end after the code specific to the environment end and after the environment group has ended. Its scope is therefore not restricted by the environment.

The hook is implemented as a reversed hook so if two packages add code to env/⟨env⟩/before and to env/⟨env⟩/after they can add surrounding environments and the order of closing them happens in the right sequence.

Given that these generic hook names involve / as part of their name they would not work if one tries to define an environment using a name that involves a /.¹⁰

Generic environment hooks are never one-time hooks even with environments that are supposed to appear only once in a document.¹¹ In contrast to other hooks there is also no need to declare them using \NewHook.

¹⁰Officially, LATEX names for environments should only consist of a sequence of letters, numbers, and the character *, i.e., this is not a new restriction.

¹¹Thus if one adds code to such hooks after the environment has been processed, it will only be executed if the environment appears again and if that doesn't happen the code will never get executed.

The hooks are only executed if `\begin{env}` and `\end{env}` is used. If the environment code is executed via low-level calls to `\langle env` and `\rangle env` (e.g., to avoid the environment grouping) they are not available. If you want them available in code using this method, you would need to add them yourself, i.e., write something like

```
\UseHook{env/quote/before}\quote
...
\endquote\UseHook{env/quote/after}
```

to add the outer hooks, etc.

Largely for compatibility with existing packages, the following four commands are also available to set the environment hooks; but for new packages we recommend directly using the hook names and `\AddToHook`.

\BeforeBeginEnvironment `\BeforeBeginEnvironment [<label>] {<env>} {<code>}`

This declaration adds to the `env/<env>/before` hook using the `<label>`. If `<label>` is not given, the `<default label>` is used (see section [2.1.5](#)).

\AtBeginEnvironment `\AtBeginEnvironment [<label>] {<env>} {<code>}`

This is like `\BeforeBeginEnvironment` but it adds to the `env/<env>/begin` hook.

\AtEndEnvironment `\AtEndEnvironment [<label>] {<env>} {<code>}`

This is like `\BeforeBeginEnvironment` but it adds to the `env/<env>/end` hook.

\AfterEndEnvironment `\AfterEndEnvironment [<label>] {<env>} {<code>}`

This is like `\BeforeBeginEnvironment` but it adds to the `env/<env>/after` hook.

3.1.2 Generic hooks for commands

Similar to environments there are now (at least in theory) two generic hooks available for any L^AT_EX command. These are

cmd/<name>/before This hook is executed at the very start of the command execution.

cmd/<name>/after This hook is executed at the very end of the command body. It is implemented as a reversed hook.

In practice there are restrictions and especially the `after` hook works only with a subset of commands. Details about these restrictions are documented in `ltcmdhooks-doc.pdf` or with code in `ltcmdhooks-code.pdf`.

3.1.3 Generic hooks provided by file loading operations

There are several hooks added to L^AT_EX's process of loading file via its high-level interfaces such as `\input`, `\include`, `\usepackage`, `\RequirePackage`, etc. These are documented in `ltfilehook-doc.pdf` or with code in `ltfilehook-code.pdf`.

3.2 Hooks provided by `\begin{document}`

Until 2020 `\begin{document}` offered exactly one hook that one could add to using `\AtBeginDocument`. Experiences over the years have shown that this single hook in one place was not enough and as part of adding the general hook management system a number of additional hooks have been added at this point. The places for these hooks have been chosen to provide the same support as offered by external packages, such as `etoolbox` and others that augmented `\document` to gain better control.

Supported are now the following hooks (all of them one-time hooks):

`begindocument/before` This hook is executed at the very start of `\document`, one can think of it as a hook for code at the end of the preamble section and this is how it is used by `etoolbox`'s `\AtEndPreamble`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

`begindocument` This hook is added to by using `\AddToHook{begindocument}` or by using `\AtBeginDocument` and it is executed after the `.aux` file has been read and most initialization are done, so they can be altered and inspected by the hook code. It is followed by a small number of further initializations that shouldn't be altered and are therefore coming later.

The hook should not be used to add material for typesetting as we are still in L^AT_EX's initialization phase and not in the document body. If such material needs to be added to the document body use the next hook instead.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

`begindocument/end` This hook is executed at the end of the `\document` code in other words at the beginning of the document body. The only command that follows it is `\ignorespaces`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

The generic hooks executed by `\begin` also exist, i.e., `env/document/before` and `env/document/begin`, but with this special environment it is better use the dedicated one-time hooks above.

3.3 Hooks provided by `\end{document}`

L^AT_EX 2_E has always provided `\AtEndDocument` to add code to the `\end{document}`, just in front of the code that is normally executed there. While this was a big improvement over the situation in L^AT_EX 2.09, it was not flexible enough for a number of use cases and so packages, such as `etoolbox`, `atveryend` and others patched `\enddocument` to add additional points where code could be hooked into.

Patching using packages is always problematical as leads to conflicts (code availability, ordering of patches, incompatible patches, etc.). For this reason a number of additional hooks have been added to the `\enddocument` code to allow packages to add code in various places in a controlled way without the need for overwriting or patching the core code.

Supported are now the following hooks (all of them one-time hooks):

enddocument The hook associated with `\AtEndDocument`. It is immediately called at the beginning of `\end{document}`.

When this hook is executed there may be still unprocessed material (e.g., floats on the deferlist) and the hook may add further material to be typeset. After it, `\clearpage` is called to ensure that all such material gets typeset. If there is nothing waiting the `\clearpage` has no effect.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/afterlastpage As the name indicates this hook should not receive code that generates material for further pages. It is the right place to do some final housekeeping and possibly write out some information to the `.aux` file (which is still open at this point to receive data, but since there will be no more pages you need to write to it using `\immediate\write`). It is also the correct place to set up any testing code to be run when the `.aux` file is re-read in the next step.

After this hook has been executed the `.aux` file is closed for writing and then read back in to do some tests (e.g., looking for missing references or duplicated labels, etc.).

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/afteraux At this point, the `.aux` file has been reprocessed and so this is a possible place for final checks and display of information to the user. However, for the latter you might prefer the next hook, so that your information is displayed after the (possibly longish) list of files if that got requested via `\listfiles`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/info This hook is meant to receive code that write final information messages to the terminal. It follows immediately after the previous hook (so both could have been combined, but then packages adding further code would always need to also supply an explicit rule to specify where it should go).

This hook already contains some code added by the kernel (under the labels `kernel/filelist` and `kernel/warnings`), namely the list of files when `\listfiles` has been used and the warnings for duplicate labels, missing references, font substitutions etc.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/end Finally, this hook is executed just in front of the final call to `\@@end`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5). Is it even possible to add code after this one?

There is also the hook `shipout/lastpage`. This hook is executed as part of the last `\shipout` in the document to allow package to add final `\special`'s to that page. Where this hook is executed in relation to those from the above list can vary from document to document. Furthermore to determine correctly which of the `\shipouts` is the last one,

\LaTeX needs to be run several times, so initially it might get executed on the wrong page. See section 3.4 for where to find the details.

It is also possible to use the generic `env/document/end` hook which is executed by `\end`, i.e., just in front of the first hook above. Note however that the other generic `\end` environment hook, i.e., `env/document/after` will never get executed, because by that time \LaTeX has finished the document processing.

3.4 Hooks provided by `\shipout` operations

There are several hooks and mechanisms added to \LaTeX 's process of generating pages. These are documented in `ltshipout-doc.pdf` or with code in `ltshipout-code.pdf`.

3.5 Hooks provided for paragraphs

The paragraph processing has been augmented to include a number of internal and public hooks. These are documented in `ltpara-doc.pdf` or with code in `ltpara-code.pdf`.

3.6 Hooks provided in NFSS commands

In languages that need to support more than one script in parallel (and thus several sets of fonts, e.g., supporting both Latin and Japanese fonts), NFSS font commands such as `\sffamily` need to switch both the Latin family to “Sans Serif” and in addition alter a second set of fonts.

To support this, several NFSS commands have hooks to which such support can be added.

rmfamily After `\rmfamily` has done its initial checks and prepared a font series update, this hook is executed before `\selectfont`.

sffamily This is like the `rmfamily` hook, but for the `\sffamily` command.

ttfamily This is like the `rmfamily` hook, but for the `\ttfamily` command.

normalfont The `\normalfont` command resets the font encoding, family, series and shape to their document defaults. It then executes this hook and finally calls `\selectfont`.

expand@font@defaults The internal `\expand@font@defaults` command expands and saves the current defaults for the meta families (rm/sf/tt) and the meta series (bf/md). If the NFSS machinery has been augmented, e.g., for Chinese or Japanese fonts, then further defaults may need to be set at this point. This can be done in this hook which is executed at the end of this macro.

bfseries/defaults, bfseries If the `\bfdefault` was explicitly changed by the user, its new value is used to set the bf series defaults for the meta families (rm/sf/tt) when `\bfseries` is called. The `bfseries/defaults` hook allows further adjustments to be made in this case. This hook is only executed if such a change is detected. In contrast, the `bfseries` hook is always executed just before `\selectfont` is called to change to the new series.

mdseries/defaults, mdseries These two hooks are like the previous ones but they are in the `\mdseries` command.

selectfont This hook is executed inside `\selectfont`, after the current values for *encoding*, *family*, *series*, *shape*, and *size* are evaluated and the new font is selected (and if necessary loaded). After the hook has executed, NFSS will still do any updates necessary for a new *size* (such as changing the size of `\strut`) and any updates necessary to a change in *encoding*.

This hook is intended for use cases where, in parallel to a change in the main font, some other fonts need to be altered (e.g., in CJK processing where you may need to deal with several different alphabets).

3.7 Hook provided by the mark mechanism

See `ltmarks-doc.pdf` for details.

insertmark This hook allows for a special setup while `\InsertMark` inserts a mark. It is executed in group so local changes only apply to the mark being inserted.

4 The Implementation

```

1  <@@=hook>
2  <*2ekernel | latexrelease>
3  \ExplSyntaxOn
4  <latexrelease> \NewModuleRelease{2020/10/01}{lthooks}
5  <latexrelease>           {The~hook~management~system}
```

4.1 Debugging

`\g__hook_debug_bool` Holds the current debugging state.

```
6  \bool_new:N \g__hook_debug_bool
```

(End of definition for `\g__hook_debug_bool`.)

`\hook_debug_on:` Turns debugging on and off by redefining `__hook_debug:n`.

```

7  \cs_new_eq:NN \__hook_debug:n \use_none:n
8  \cs_new_protected:Npn \hook_debug_on:
9  {
10    \bool_gset_true:N \g__hook_debug_bool
11    \__hook_debug_gset:
12  }
13 \cs_new_protected:Npn \hook_debug_off:
14 {
15  \bool_gset_false:N \g__hook_debug_bool
16  \__hook_debug_gset:
17 }
18 \cs_new_protected:Npn \__hook_debug_gset:
19 {
20  \cs_gset_protected:Npx \__hook_debug:n ##1
21  { \bool_if:NT \g__hook_debug_bool {##1} }
22 }
```

(End of definition for `\hook_debug_on:` and others. These functions are documented on page 214.)

4.2 Borrowing from internals of other kernel modules

__hook_str_compare:nn Private copy of __str_if_eq:nn
23 \cs_new_eq:NN __hook_str_compare:nn __str_if_eq:nn
(End of definition for __hook_str_compare:nn.)

4.3 Declarations

\l__hook_tmpa_bool Scratch boolean used throughout the package.

24 \bool_new:N \l__hook_tmpa_bool

(End of definition for \l__hook_tmpa_bool.)

\l__hook_return_tl Scratch variables used throughout the package.

25 \tl_new:N \l__hook_return_tl

26 \tl_new:N \l__hook_tmpa_tl

27 \tl_new:N \l__hook_tmpb_tl

(End of definition for \l__hook_return_tl, \l__hook_tmpa_tl, and \l__hook_tmpb_tl.)

\g__hook_all_seq In a few places we need a list of all hook names ever defined so we keep track if them in this sequence.

28 \seq_new:N \g__hook_all_seq

(End of definition for \g__hook_all_seq.)

\l__hook_cur_hook_tl Stores the name of the hook currently being sorted.

29 \tl_new:N \l__hook_cur_hook_tl

(End of definition for \l__hook_cur_hook_tl.)

\l__hook_work_prop A property list holding a copy of the \g__hook_<hook>_code_prop of the hook being sorted to work on, so that changes don't act destructively on the hook data structure.

30 \prop_new:N \l__hook_work_prop

(End of definition for \l__hook_work_prop.)

\g__hook_used_prop All hooks that receive code (for use in debugging display).

31 \prop_new:N \g__hook_used_prop

(End of definition for \g__hook_used_prop.)

\g__hook_hook_curr_name_tl \g__hook_name_stack_seq Default label used for hook commands, and a stack to keep track of packages within packages.

32 \tl_new:N \g__hook_hook_curr_name_tl

33 \seq_new:N \g__hook_name_stack_seq

(End of definition for \g__hook_hook_curr_name_tl and \g__hook_name_stack_seq.)

__hook_tmp:w Temporary macro for generic usage.

34 \cs_new_eq:NN __hook_tmp:w ?

(End of definition for __hook_tmp:w.)

<code>\c__hook_empty_tl</code>	An empty token list, and one containing nine parameters.
	<code>35 \tl_const:Nn \c__hook_empty_tl { }</code>
	<code>36 \tl_const:Nn \c__hook_nine_parameters_tl { #1#2#3#4#5#6#7#8#9 }</code>
	<i>(End of definition for \c__hook_empty_tl and \c__hook_nine_parameters_tl.)</i>
<code>\tl_gremove_once:Nx</code>	Some variants of <code>expl3</code> functions.
	<i>FMi: should probably be moved to expl3</i>
	<code>37 \cs_generate_variant:Nn \tl_gremove_once:Nn { Nx }</code>
	<code>38 \cs_generate_variant:Nn \tl_show:n { x }</code>
	<code>39 \cs_generate_variant:Nn \tl_log:n { x }</code>
	<code>40 \cs_generate_variant:Nn \tl_set:Nn { Ne }</code>
	<code>41 \cs_generate_variant:Nn \cs_replacement_spec:N { c }</code>
	<code>42 \cs_generate_variant:Nn \prop_put:Nnn { Nne }</code>
	<code>43 \cs_generate_variant:Nn \str_count:n { e }</code>
	<i>(End of definition for \tl_gremove_once:Nx and others.)</i>
<code>\s__hook_mark</code>	Scan mark used for delimited arguments.
	<code>44 \scan_new:N \s__hook_mark</code>
	<i>(End of definition for \s__hook_mark.)</i>
<code>_hook_use_none_delimit_by_s_mark:w</code>	Removes tokens until the next <code>\s__hook_mark</code> .
<code>_hook_use_i_delimit_by_s_mark:nw</code>	
	<code>45 \cs_new:Npn _hook_use_none_delimit_by_s_mark:w #1 \s__hook_mark { }</code>
	<code>46 \cs_new:Npn _hook_use_i_delimit_by_s_mark:nw #1 #2 \s__hook_mark {#1}</code>
	<i>(End of definition for _hook_use_none_delimit_by_s_mark:w and _hook_use_i_delimit_by_s_mark:nw.)</i>
<code>_hook_tl_set:cn</code>	Private copies of a few <code>expl3</code> functions. <code>\l3debug</code> will only add debugging to the public names, not to these copies, so we don't have to use <code>\debug_suspend:</code> and <code>\debug_resume:</code> everywhere.
	Functions like <code>_hook_tl_set:Nn</code> have to be redefined, rather than copied because in <code>expl3</code> they use <code>_kernel_tl_(g)set:Nx</code> , which is also patched by <code>\l3debug</code> .
	<code>47 \cs_new_protected:Npn _hook_tl_set:cn #1#2</code>
	<code>48 { \cs_set_nopar:cp {#1} { _kernel_exp_not:w {#2} } }</code>
	<i>(End of definition for _hook_tl_set:cn.)</i>
<code>_hook_tl_gset:Nn</code>	Same as above.
<code>_hook_tl_gset:Nx</code>	
<code>_hook_tl_gset:cn</code>	
<code>_hook_tl_gset:co</code>	
<code>_hook_tl_gset:cx</code>	
	<code>49 \cs_new_protected:Npn _hook_tl_gset:Nn #1#2</code>
	<code>50 { \cs_gset_nopar:Npx #1 { _kernel_exp_not:w {#2} } }</code>
	<code>51 \cs_new_protected:Npn _hook_tl_gset:Nx #1#2</code>
	<code>52 { \cs_gset_nopar:Npx #1 {#2} }</code>
	<code>53 \cs_generate_variant:Nn _hook_tl_gset:Nn { c, co }</code>
	<code>54 \cs_generate_variant:Nn _hook_tl_gset:Nx { c }</code>
	<i>(End of definition for _hook_tl_gset:Nn.)</i>
<code>_hook_tl_gput_right:Nn</code>	Same as above.
<code>_hook_tl_gput_right:Nx</code>	
<code>_hook_tl_gput_right:cn</code>	
	<code>55 \cs_new_protected:Npn _hook_tl_gput_right:Nn #1#2</code>
	<code>56 { _hook_tl_gset:Nx #1 { _kernel_exp_not:w \exp_after:wN { #1 #2 } } }</code>
	<code>57 \cs_generate_variant:Nn _hook_tl_gput_right:Nn { Ne, cn }</code>

(End of definition for `__hook_tl_gput_right:Nn`.)

`__hook_tl_gput_left:Nn` Same as above.

```
58 \cs_new_protected:Npn \_\_hook_tl_gput_left:Nn #1#2
59   {
60     \_\_hook_tl_gset:Nx #1
61     { \_\_kernel_exp_not:w {#2} \_\_kernel_exp_not:w \exp_after:wN {#1} }
62   }
```

(End of definition for `__hook_tl_gput_left:Nn`.)

`__hook_tl_gset_eq:NN` Same as above.

```
63 \cs_new_eq:NN \_\_hook_tl_gset_eq:NN \tl_gset_eq:NN
```

(End of definition for `__hook_tl_gset_eq:NN`.)

`__hook_tl_gclear:N` Same as above.

```
64 \cs_new_protected:Npn \_\_hook_tl_gclear:N #1
65   { \_\_hook_tl_gset_eq:NN #1 \c_empty_tl }
66 \cs_generate_variant:Nn \_\_hook_tl_gclear:N { c }
```

(End of definition for `__hook_tl_gclear:N`.)

4.4 Providing new hooks

4.4.1 The data structures of a hook

`\g_hook_<hook>_code_prop` Hooks have a name (called `<hook>` in the description below) and for each hook we have
`__hook_<hook>` to provide a number of data structures. These are

`\g_hook_<hook>_reversed_t1` `\g_hook_<hook>_code_prop` A property list holding the code for the hook in separate
`\g_hook_<hook>_declared_t1` chunks. The keys are by default the package names that add code to the hook, but
`\g_hook_<hook>_parameter_t1` it is possible for packages to define other keys.
`__hook_next_<hook>`

`__hook_toplevel_<hook>` `\g_hook_<hook>_rule_<label1>|<label2>_t1` A token list holding the relation between
`<label1>` and `<label2>` in the `<hook>`. The `<labels>` are lexically (reverse)
sorted to ensure that two labels always point to the same token list. For global
rules, the `<hook>` name is `??`.

`__hook_<hook>` The code that is actually executed when the hook is called in the document
is stored in this token list. It is constructed from the code chunks applying
the information. This token list is named like that so that in case of an error inside
the hook, the reported token list in the error is shorter, and to make it simpler to
normalize hook names in `__hook_make_name:n`.

`\g_hook_<hook>_reversed_t1` Some hooks are “reversed”. This token list stores a `-` for
such hook so that it can be identified. The `-` character is used because `<reversed>1`
is `+1` for normal hooks and `-1` for reversed ones.

`\g_hook_<hook>_declared_t1` This token list serves as a marker for the hook being
officially declared. Its existence is tested to raise an error in case another declaration
is attempted.

`\c_{hook}_{hook}_parameter_t1` This token list stores the parameter text for a declared hook (its existence almost completely intersects the token list above), which is used for managing hooks with arguments.

`__hook_toplevel_{hook}` This token list stores the code inserted in the hook from the user's document, in the `top-level` label. This label is special, and doesn't participate in sorting. Instead, all code is appended to it and executed after (or before, if the hook is reversed) the normal hook code, but before the `next` code chunk.

`__hook_next_{hook}` Finally there is extra code (normally empty) that is used on the next invocation of the hook (and then deleted). This can be used to define some special behavior for a single occasion from within the document. This token list follows the same naming scheme than the main `__hook_{hook}` token list. It is called `__hook_next_{hook}` rather than `__hook_next_{hook}` because otherwise a hook whose name is `next_{hook}` would clash with the next code-token list of the hook called `{hook}`.

4.4.2 On the existence of hooks

A hook may be in different states of existence. Here we give an overview of the internal commands to set up hooks and explain how the different states are distinguished. The actual implementation then follows in subsequent sections.

One problem we have to solve is that we need to be able to add code to hooks (e.g., with `\AddToHook`) even if that code has not yet been declared. For example, one package needs to write into a hook of another package, but that package may not get loaded, or is loaded only later. Another problem is that most hooks, but not the generic hooks, require a declaration.

We therefore distinguish the following states for a hook, which are managed by four different tests: structure existence (`__hook_if_structure_exist:nTF`), creation (`__hook_if_usable:nTF`), declaration (`__hook_if_declared:nTF`) and disabled or not (`__hook_if_disabled:nTF`)

not existing Nothing is known about the hook so far. This state can be detected with `__hook_if_structure_exist:nTF` (which uses the false branch).

In this state the hook can be declared, disabled, rules can be defined or code could be added to it, but it is not possible to use the hook (with `\UseHook`).

basic data structure set up A hook is this state when its basic data structure has been set up (using `__hook_init_structure:n`). The data structure setup happens automatically when commands such as `\AddToHook` are used and the hook is at that point in state "not existing".

In this state the four tests give the following results:

```
\_\_hook_if_structure_exist:nTF returns true.  
    \_\_hook_if_usable:nTF returns false.  
    \_\_hook_if_declared:nTF returns false.  
    \_\_hook_if_disabled:nTF returns false.
```

The allowed actions are the same as in the "not existing" state.

declared A hook is in this state it is not disabled and was explicitly declared (e.g., with `\NewHook`). In this case the four tests give the following results:

```
\_\_hook\_if\_structure\_exist:nTF returns true.
    \_\_hook\_if\_usable:nTF returns true.
    \_\_hook\_if\_declared:nTF returns true.
    \_\_hook\_if\_disabled:nTF returns false.
```

usable A hook is in this state if it is not disabled, was not explicitly declared but nevertheless is allowed to be used (with `\UseHook` or `\hook_use:n`). This state is only possible for generic hooks as they do not need to be declared. Therefore such hooks move directly from state “not existing” to “usable” the moment a declaration such as `\AddToHook` wants to add to the hook data structure. In this state the tests give the following results:

```
\_\_hook\_if\_structure\_exist:nTF returns true.
    \_\_hook\_if\_usable:nTF returns true.
    \_\_hook\_if\_declared:nTF returns false.
    \_\_hook\_if\_disabled:nTF returns false.
```

disabled A generic hook in any state is moved to this state when `\DisableGenericHook` is used. This changes the tests to give the following results:

```
\_\_hook\_if\_structure\_exist:nTF unchanged.
    \_\_hook\_if\_usable:nTF returns false.
    \_\_hook\_if\_declared:nTF returns true.
    \_\_hook\_if\_disabled:nTF returns true.
```

The structure test is unchanged (if the hook was unknown before it is `false`, otherwise `true`). The usable test returns `false` so that any `\UseHook` will bypass the hook from now on. The declared test returns `true` so that any further `\NewHook` generates an error and the disabled test returns `true` so that `\AddToHook` can return an error.

FMi: maybe it should do this only after begin document?

4.4.3 Setting hooks up

\hook_new:n
\hook_new_with_args:nn

```
67  \hook_new:n
68  \hook_new_with_args:nn
69  \cs_new_protected:Npn \hook_new:n #1
70  { \__hook_normalize_hook_args:Nn \__hook_new:nn {#1} { 0 } }
71  \cs_new_protected:Npn \hook_new_with_args:nn #1 #2
72  { \__hook_normalize_hook_args:Nn \__hook_new:nn {#1} {#2} }
73  \cs_new_protected:Npn \__hook_new:nn #1 #2
74  {
```

We check if the hook was already *explicitly* declared with `\hook_new:n`, and if it already exists we complain, otherwise set the “created” flag for the hook so that it errors next time `\hook_new:n` is used.

```

75      \__hook_if_declared:nTF {#1}
76          { \msg_error:nnn { hooks } { exists } {#1} }
77          {
78              \tl_new:c { g__hook_#1_declared_tl }
79              \cs_undefine:c { __hook~#1 }
80              \cs_undefine:c { c__hook_#1_parameter_tl }
81              \__hook_make_usable:nn {#1} {#2}

```

In case there is already code in a hook, but it’s undeclared, run `__hook_update_hook_code:n` to make it ready to be executed (see test `lthooks-034`).

```

82          \__hook_update_hook_code:n {#1}
83      }
84  }
85 \EndIncludeInRelease
86 \IncludeInRelease{2020/10/01}{\hook_new_with_args:nn}
87 {Hooks~with-args}
88 \cs_gset_protected:Npn \hook_new:n #1

```

(End of definition for `\hook_new:n`, `\hook_new_with_args:nn`, and `__hook_new:nn`. These functions are documented on page [211](#).)

`__hook_make_usable:nn`

This initializes all hook data structures for the hook but if used on its own doesn’t mark the hook as declared (as `\hook_new:n` does, so a later `\hook_new:n` on that hook will not result in an error. This command is internally used by `\hook_gput_code:nnn` when adding code to a generic hook.

```

102 \IncludeInRelease{2023/06/01}{\__hook_make_usable:nn}
103 {Hooks~with-args}
104 \cs_new_protected:Npn \__hook_make_usable:nn #1 #2
105 {

```

Now we check if the hook’s data structure can be safely created without `expl3` raising errors, then we add the hook name to the list of all hooks and allocate the necessary data structures for the new hook, otherwise just do nothing.

```

106 \__hook_if_usable:nF {#1}
107 {
108     \seq_gput_right:Nn \g__hook_all_seq {#1}

```

Here we'll define the `\c__hook_<hook>_parameter_tl` to hold a run of parameters up to the number of arguments of the hook (#2).

```

109      \_kernel_cs_parm_from_arg_count:nNF
110      { \tl_const:cn { c__hook_#1_parameter_tl } } {#2}
111      {
112          \msg_error:nnn { hooks } { too-many-args } {#1} {#2}
113          \tl_const:cx { c__hook_#1_parameter_tl }
114          { \exp_not:V \c__hook_nine_parameters_tl }
115      }

```

After that, use `_hook_normalise_cs_args:nn` to correct the number of parameters of the macros `_hook_toplevel<hook>` and `_hook_next<hook>`. We need to be able to add code with arguments to a hook without prior knowledge of the number of arguments of that hook, so `lthooks` assumes 9 until the hook is properly declared and the number of arguments is known. `_hook_normalise_cs_args:nn` does the normalization by using the `\c__hook_<hook>_parameter_tl` defined just above.

```

116      \_hook_normalise_cs_args:nn { _toplevel } {#1}
117      \_hook_normalise_cs_args:nn { _next } {#1}

```

This is only used by the actual code of the current hook, so declare it normally:

```
118      \_hook_code_gset:nn {#1} { }
```

Now ensure that the base data structure for the hook exists:

```
119      \_hook_init_structure:n {#1}
```

The call to `_hook_normalise_code_pool:n` will correct any improper reference to arguments that don't exist in the hook, raising a low-level `TEX` error and doubling the offending parameter tokens. It has to be done after `_hook_init_structure:n` because it operates on `\g__hook_<hook>_code_prop`.

```
120      \_hook_normalise_code_pool:n {#1}
```

The `\g__hook_<hook>_labels_clist` holds the sorted list of labels (once it got sorted). This is used only for debugging. These are defined conditionally, in case `_hook_make_usable:nn` is being used to redefine a hook.

```

121      \clist_if_exist:cF { g__hook_#1_labels_clist }
122      {
123          \clist_new:c { g__hook_#1_labels_clist }

```

Some hooks should reverse the default order of code chunks. To signal this we have a token list which is empty for normal hooks and contains a `-` for reversed hooks.

```

124      \tl_new:c { g__hook_#1_reversed_tl }
125      }

```

The above is all in L3 convention, but we also provide an interface to legacy `LATEX 2 ε` hooks of the form `\@...hook`, e.g., `\begin{document}hook`. There have been a few of them and they have been added to using `\g@addto@macro`. If there exists such a macro matching the name of the new hook, i.e., `\@<hook-name>hook` and it is not empty then we add its contents as a code chunk under the label `legacy`.

Warning: this support will vanish in future releases!

```

126      \_hook_include_legacy_code_chunk:n {#1}
127      }
128  }
129  \end{InRelease}

```

```

```

(End of definition for `__hook_make_usable:nn`.)

`__hook_init_structure:n` This function declares the basic data structures for a hook without explicit declaring the hook itself. This is needed to allow adding to undeclared hooks. Here it is unnecessary to check whether all variables exist, since all three are declared at the same time (either all of them exist, or none).

It creates the hook code pool (`\g__hook_<hook>_code_prop`) and the `top-level` and `next` token lists. A hook is initialized with `__hook_init_structure:n` the first time anything is added to it. Initializing a hook just with `__hook_init_structure:n` will not make it usable with `\hook_use:n`.

`_hook_include_legacy_code_chunk:n` The L^AT_EX legacy concept for hooks uses with hooks the following naming scheme in the code: `\@...hook`.

If this macro is not empty we add it under the label `legacy` to the current hook and then empty it globally. This way packages or classes directly manipulating commands such as `\begindocumenthook` still get their hook data added.

Warning: this support will vanish in future releases!

```

229 \IncludeInRelease{2023/06/01}{\_hook_include_legacy_code_chunk:n}
230                                     {Hooks~with~args}
231 \cs_new_protected:Npn \_hook_include_legacy_code_chunk:n #1
232 {

```

If the macro doesn't exist (which is the usual case) then nothing needs to be done.

```

233   \tl_if_exist:cT { @#1hook }
234   {

```

Of course if the legacy hook exists but is empty, there is no need to add anything under `legacy` the legacy label.

```

235   \tl_if_empty:cF { @#1hook }
236   {

```

Here we set `_hook_replacing_args_false:` because no legacy code will reference hook arguments.

```

237   \_hook_replacing_args_false:
238   \use:e
239   {
240     \_hook_hook_gput_code_do:nnn {#1} { legacy }
241     { \exp_not:v { @#1hook } }
242   }
243   \_hook_replacing_args_reset:

```

Once added to the hook, we need to clear it otherwise it might get added again later if the hook data gets updated.

```

244   \_hook_tl_gclear:c { @#1hook }
245   }
246   }
247   }

4.4.4 Disabling and providing hooks

`\hook_disable_generic:n`
`__hook_disable:n`
`__hook_if_disabled_p:n`
`__hook_if_disabled:nTF`

Disables a hook by creating its `\g__hook_<hook>_declared_tl` so that the hook errors when used with `\hook_new:n`, then it undefines `__hook_<hook>` so that it may not be executed.

This does not clear any code that may be already stored in the hook's structure, but doesn't allow adding more code. `__hook_if_disabled:nTF` uses that specific combination to check if the hook is disabled.

```

264 <latexrelease> \IncludeInRelease{2021/06/01}{\hook_disable_generic:n}
265 <latexrelease> {Disable~hooks}
266 \cs_new_protected:Npn \hook_disable_generic:n #1

(End of definition for `\hook_activate_generic:n` and `_hook_activate_generic:n`. This function is documented on page 212.)

4.5 Parsing a label

`_hook_parse_label_default:nN`

This macro checks if a label was given (not `\c_novalue_tl`), and if so, tries to parse the label looking for a leading `.` to replace by `_hook_currname_or_default:`. #2 is a boolean representing if #1 is a label name.

```
330 \cs_new:Npn \_hook_parse_label_default:nN #1#2
331 {
332     \tl_if_novalue:nTF {#1}
333     { \_hook_currname_or_default: }
334     { \tl_trim_spaces_apply:nN {#1} \_hook_parse_dot_label:nN #2 }
335 }
```

(End of definition for `_hook_parse_label_default:nN`.)

`_hook_parse_dot_label:nN`

Start by checking if the label is empty, which raises an error, and uses the fallback value. If not, split the label at a `./`, if any, and check if no tokens are before the `./`, or if the only character is a `..`. If these requirements are fulfilled, the leading `.` is replaced with `_hook_currname_or_default:`. Otherwise the label is returned unchanged. #2 is a boolean representing if #1 is a label name.

```
336 \cs_new:Npn \_hook_parse_dot_label:nN #1#2
337 {
338     \tl_if_empty:nTF {#1}
339     {
340         \bool_if:NTF #2
341             { \msg_expandable_error:nn { hooks } { empty-label } }
342             { \msg_expandable_error:nn { hooks } { empty-hook } }
343         \_hook_currname_or_default:
344     }
345     {
346         \str_if_eq:nnTF {#1} { . }
347             { \_hook_currname_or_default: }
348             { \_hook_parse_dot_label:w #1 ./ \s__hook_mark }
349     }
350 }
351 \cs_new:Npn \_hook_parse_dot_label:w #1 ./ #2 \s__hook_mark
352 {
353     \tl_if_empty:nTF {#1}
354     {
355         \_hook_parse_dot_label_aux:w #2 \s__hook_mark
356     }
357     {
358         \tl_if_empty:nTF {#2}
359             { \_hook_make_name:n {#1} }
360             { \_hook_parse_dot_label_cleanup:w #1 ./ #2 \s__hook_mark }
361     }
362 \cs_new:Npn \_hook_parse_dot_label_cleanup:w #1 ./ \s__hook_mark {#1}
363 \cs_new:Npn \_hook_parse_dot_label_aux:w #1 ./ \s__hook_mark
364     { \_hook_currname_or_default: / \_hook_make_name:n {#1} }
```

(End of definition for `_hook_parse_dot_label:nN` and others.)

`__hook_currname_or_default:` This uses `\g__hook_hook_curr_name_tl` if it is set, otherwise it tries `\@currname`. If neither is set, it raises an error and uses the fallback value `label-missing`.

```

364 \cs_new:Npn \__hook_currname_or_default:
365   {
366     \tl_if_empty:NTF \g__hook_hook_curr_name_tl
367     {
368       \tl_if_empty:NTF \@currname
369       {
370         \msg_expandable_error:nnn { latex2e } { should-not-happen }
371         {
372           \Empty~default-label.
373           \__hook_make_name:n { label-missing }
374         }
375       }
376     { \g__hook_hook_curr_name_tl }
377   }

```

(End of definition for `__hook_currname_or_default::`)

`__hook_make_name:n` This provides a standard sanitization of a hook's name. It uses `\cs:w` to build a control sequence out of the hook name, then uses `\cs_to_str:N` to get the string representation of that, without the escape character. `\cs:w`-based expansion is used instead of `e`-based because Unicode characters don't behave well inside `\expanded`. The macro adds the `__hook_` prefix to the hook name to reuse the hook's code token list to build the csname and avoid leaving "public" control sequences defined (as `\relax`) in TeX's memory.

```

378 \cs_new:Npn \__hook_make_name:n #1
379   {
380     \exp_after:wN \exp_after:wN \exp_after:wN \__hook_make_name:w
381     \exp_after:wN \token_to_str:N \cs:w __hook~ #1 \cs_end:
382   }
383 \exp_last_unbraced:NNNNo
384 \cs_new:Npn \__hook_make_name:w #1 \tl_to_str:n { __hook~ } { }

```

(End of definition for `__hook_make_name:n` and `__hook_make_name:w`)

`__hook_normalize_hook_args:Nn`
`__hook_normalize_hook_args:Nnn`
`__hook_normalize_hook_rule_args:Nnnnn`
`__hook_normalize_hook_args_aux:Nn`

This is the standard route for normalizing hook and label arguments. The main macro does the entire operation within a group so that csnames made by `__hook_make_name:n` are wiped off before continuing. This means that this function cannot be used for `\hook_use:n!`

```

385 \cs_new_protected:Npn \__hook_normalize_hook_args_aux:Nn #1 #2
386   {
387     \group_begin:
388     \use:e
389     {
390       \group_end:
391       \exp_not:N #1 #2
392     }
393   }
394 \cs_new_protected:Npn \__hook_normalize_hook_args:Nn #1 #2
395   {
396     \__hook_normalize_hook_args_aux:Nn #1
397     { { \__hook_parse_label_default:nN {#2} \c_false_bool } }
398   }

```

```

399 \cs_new_protected:Npn \__hook_normalize_hook_args:Nnn #1 #2 #3
400   {
401     \__hook_normalize_hook_args_aux:Nn #1
402     {
403       { \__hook_parse_label_default:nN {#2} \c_false_bool }
404       { \__hook_parse_label_default:nN {#3} \c_true_bool }
405     }
406   }
407 \cs_new_protected:Npn \__hook_normalize_hook_rule_args:Nnnnn #1 #2 #3 #4 #5
408   {
409     \__hook_normalize_hook_args_aux:Nn #1
410     {
411       { \__hook_parse_label_default:nN {#2} \c_false_bool }
412       { \__hook_parse_label_default:nN {#3} \c_true_bool }
413       { \tl_trim_spaces:n {#4} }
414       { \__hook_parse_label_default:nN {#5} \c_true_bool }
415     }
416   }

```

(End of definition for `__hook_normalize_hook_args:Nn` and others.)

`__hook_curr_name_push:n`
`__hook_curr_name_push_aux:n`
`__hook_curr_name_pop:`
`__hook_end_document_label_check:`

The token list `\g__hook_hook_curr_name_tl` stores the name of the current package/file to be used as the default label in hooks. Providing a consistent interface is tricky because packages can be loaded within packages, and some packages may not use `\SetDefaultHookLabel` to change the default label (in which case `\@currname` is used).

To pull that one off, we keep a stack that contains the default label for each level of input. The bottom of the stack contains the default label for the **top-level** (this stack should never go empty). If we're building the format, set the default label to be **top-level**:

```
417 \tl_gset:Nn \g__hook_hook_curr_name_tl { top-level }
```

Then, in case we're in `latexrelease` we push something on the stack to support roll forward. But in some rare cases, `latexrelease` may be loaded inside another package (notably `platexrelease`), so we'll first push the **top-level** entry:

```
418 ⟨latexrelease⟩\seq_if_empty:NT \g__hook_name_stack_seq
419 ⟨latexrelease⟩ { \seq_gput_right:Nn \g__hook_name_stack_seq { top-level } }
```

then we dissect the `\@currnamestack`, adding `\@currname` to the stack:

```
420 ⟨latexrelease⟩\cs_set_protected:Npn \__hook_tmp:w #1 #2 #3
421 ⟨latexrelease⟩ {
422   ⟨latexrelease⟩ \quark_if_recursion_tail_stop:n {#1}
423   ⟨latexrelease⟩ \seq_gput_right:Nn \g__hook_name_stack_seq {#1}
424   ⟨latexrelease⟩ \__hook_tmp:w
425   ⟨latexrelease⟩ }
426 ⟨latexrelease⟩\exp_after:wN \__hook_tmp:w \@currnamestack
427 ⟨latexrelease⟩ \q_recursion_tail \q_recursion_tail
428 ⟨latexrelease⟩ \q_recursion_tail \q_recursion_stop
```

and finally set the default label to be the `\@currname`:

```
429 ⟨latexrelease⟩\tl_gset:Nx \g__hook_hook_curr_name_tl { \@currname }
430 ⟨latexrelease⟩\seq_gpop_right:NN \g__hook_name_stack_seq \l__hook_tmpa_tl
```

Two commands keep track of the stack: when a file is input, `__hook_curr_name_push:n` pushes the current default label onto the stack and sets the new default label (all in one go):

```

431 \cs_new_protected:Npn \__hook_curr_name_push:n #1
432   { \exp_args:Nx \__hook_curr_name_push_aux:n { \__hook_make_name:n {#1} } }
433 \cs_new_protected:Npn \__hook_curr_name_push_aux:n #1
434   {
435     \tl_if_blank:nTF {#1}
436       { \msg_error:nn { hooks } { no-default-label } }
437       {
438         \str_if_eq:nnTF {#1} { top-level }
439           {
440             \msg_error:nnnn { hooks } { set-top-level }
441             { to } { PushDefaultHookLabel } {#1}
442           }
443           {
444             \seq_gpush:NV \g__hook_name_stack_seq \g__hook_hook_curr_name_tl
445             \tl_gset:Nn \g__hook_hook_curr_name_tl {#1}
446           }
447         }
448     }

```

and when an input is over, the topmost item of the stack is popped, since that label will not be used again, and `\g__hook_hook_curr_name_tl` is updated to equal the now topmost item of the stack:

```

449 \cs_new_protected:Npn \__hook_curr_name_pop:
450   {
451     \seq_gpop:NNTF \g__hook_name_stack_seq \l__hook_return_tl
452       { \tl_gset_eq:NN \g__hook_hook_curr_name_tl \l__hook_return_tl }
453       { \msg_error:nn { hooks } { extra-pop-label } }
454   }

```

At the end of the document we want to check if there was no `__hook_curr_name_push:n` without a matching `__hook_curr_name_pop:` (not a critical error, but it might indicate that something else is not quite right):

```

455 \tl_gput_right:Nn \@kernel@after@enddocument@afterlastpage
456   { \__hook_end_document_label_check: }
457 \cs_new_protected:Npn \__hook_end_document_label_check:
458   {
459     \seq_gpop:NNT \g__hook_name_stack_seq \l__hook_return_tl
460     {
461       \msg_error:nnx { hooks } { missing-pop-label }
462       { \g__hook_hook_curr_name_tl }
463       \tl_gset_eq:NN \g__hook_hook_curr_name_tl \l__hook_return_tl
464       \__hook_end_document_label_check:
465     }
466   }

```

The token list `\g__hook_hook_curr_name_tl` is but a mirror of the top of the stack.

Now define a wrapper that replaces the top of the stack with the argument, and updates `\g__hook_hook_curr_name_tl` accordingly.

```

467 \cs_new_protected:Npn \__hook_set_default_hook_label:n #1
468   {
469     \seq_if_empty:NTF \g__hook_name_stack_seq
470       {
471         \msg_error:nnnn { hooks } { set-top-level }
472         { for } { SetDefaultHookLabel } {#1}

```

```

473     }
474     { \exp_args:Nx
475         \__hook_set_default_label:n { \__hook_make_name:n {#1} } }
476     }
477 \cs_new_protected:Npn \__hook_set_default_label:n #1
478 {
479     \str_if_eq:nnTF {#1} { top-level }
480     {
481         \msg_error:nnnn { hooks } { set-top-level }
482         { to } { SetDefaultHookLabel } {#1}
483     }
484     { \tl_gset:Nn \g__hook_hook_curr_name_tl {#1} }
485 }

```

(End of definition for `__hook_curr_name_push:n` and others.)

4.6 Adding or removing hook code

`\hook_gput_code:nnn`
`\hook_gput_code_with_args:nnn`

```

\__hook_gput_code:nnn
\__hook_gput_code_store:nnn
\__hook_gput_code:nnn
\__hook_gput_code_do:nnn
\__hook_prop_gput_labeled_cleanup:nnn
\__hook_prop_gput_labeled_do:Nnnn
486 <|latexrelease> \IncludeInRelease{2023/06/01}{\hook_gput_code:nnn}
487 <|latexrelease>           {Hooks~with~args}
488 \cs_new_protected:Npn \hook_gput_code:nnn #1 #2 #3
489 {
490     \__hook_replacing_args_false:
491     \__hook_normalize_hook_args:Nnn \__hook_gput_code:nnn {#1} {#2} {#3}
492     \__hook_replacing_args_reset:
493 }
494 \cs_new_protected:Npn \hook_gput_code_with_args:nnn #1 #2 #3
495 {
496     \__hook_replacing_args_true:
497     \__hook_normalize_hook_args:Nnn \__hook_gput_code:nnn {#1} {#2} {#3}
498     \__hook_replacing_args_reset:
499 }

```

If `\AddToHookWithArguments` was used, do some sanity checking, and if it's not possible to use arguments at this point, fall back to regular `\AddToHook` by using `__hook_replacing_args_false`:

```

500 \cs_new_protected:Npn \__hook_gput_code:nnn #1 #2 #3
501 {
502     \__hook_chk_args_allowed:nn {#1} { AddToHook }

```

Then check if the code should be executed immediately, rather than stored:

```

503     \__hook_if_execute_immediately:nTF {#1}
504     {

```

`\AddToHookWithArguments` can't be used on one-time hooks (that were already used).

```

505     \__hook_if_replacing_args:TF
506     {
507         \msg_error:nnnn { hooks } { one-time-args }
508         {#1} { AddToHook }
509     }
510     { }
511     \use:n
512 }

```

```

513     { \__hook_gput_code_store:nnn {#1} {#2} }
514         {#3}
515     }
516 \cs_new_protected:Npn \__hook_gput_code_store:nnn #1 #2 #3
517     {

```

Then check if the hook is usable.

```
518     \__hook_if_usable:nTF {#1}
```

If so we simply add (or append) the new code to the property list holding different chunks for the hook. At `\begin{document}` this is then sorted into a token list for fast execution.

```

519     {
520         \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}

```

However, if there is an update within the document we need to alter this execution code which is done by `__hook_update_hook_code:n`. In the preamble this does nothing.

```

521     \__hook_update_hook_code:n {#1}
522 }
```

If the hook is not usable, before giving up, check if it's not disabled and otherwise try to declare it as a generic hook, if its name matches one of the valid patterns.

```

523     {
524         \__hook_if_disabled:nTF {#1}
525             { \msg_error:nnn { hooks } { hook-disabled } {#1} }
526             { \__hook_try_declarating_generic_hook:nnn {#1} {#2} {#3} }
527     }
528 }
```

This macro will unconditionally add a chunk of code to the given hook.

```

529 \cs_new_protected:Npn \__hook_hook_gput_code_do:nnn #1 #2 #3
530     {

```

However, first some debugging info if debugging is enabled:

```

531     \__hook_debug:n{\iow_term:x{[lthooks]~ Add~ to~
532                         \__hook_if_usable:nF {#1} { undeclared~ }
533                         hook~ '#1'~ (#2) \on@line
534                         ^^J [lthooks] \@spaces
535                         <-- \tl_to_str:n{#3}}}

```

Then try to get the code chunk labeled #2 from the hook. If there's code already there, then append #3 to that, otherwise just put #3. If the current label is `top-level`, the code is added to a dedicated token list `__hook_toplevel_{hook}` that goes at the end of the hook (or at the beginning, for a reversed hook), just before `__hook_next_{hook}`.

```

536     \str_if_eq:nnTF {#2} { top-level }
537     {
538         \str_if_eq:eeTF { top-level } { \__hook_currname_or_default: }
539         {

```

If the hook's basic structure does not exist, we need to declare it with `__hook_init_structure:n`.

```
540     \__hook_init_structure:n {#1}
```

Then append to the `_toplevel` container for the hook.

```

541         \_\_hook\_cs\_gput\_right:nnn { _toplevel } {#1} {#3}
542     }
543     { \msg_error:nnn { hooks } { misused-top-level } {#1} }
544   }
545   {

```

When adding to the code pool, we have to double hashes if `\AddToHook` was used (`replacing_args` is false), so that later it is turned into a single parameter token, rather than a parameter to the hook macro.

```

546     \exp_args:Nx \_\_hook\_prop\_gput\_labeled\_cleanup:nnn
547     {
548       \_\_hook\_if\_replacing\_args:TF
549       { \exp_not:n }
550       { \_\_hook\_double\_hashes:n }
551       {#3}
552     }
553     {#1} {#2}
554   }
555 }

Adds code to a hook's code pool.
```

```

556 \cs_new_protected:Npn \_\_hook\_prop\_gput\_labeled\_cleanup:nnn #1 #2 #3
557   {
558     \tl_set:Nn \l_\_hook_return_tl {#1}

```

(End of definition for \hook_gput_code:nnn and others. These functions are documented on page 213.)

__hook_chk_args_allowed:nn

This macro checks if it is possible to add code with references to a hook's arguments for hook #1. It only does something if the function being run is `replacing_args`. This macro will error if the hook is declared and takes no arguments, then it will set `__hook_replacing_args_false`: so that the macro which called it will add the code normally.

```

`__hook_gput_undeclared_hook:nnn`

Often it may happen that a package *A* defines a hook `foo`, but package *B*, that adds code to that hook, is loaded before *A*. In such case we need to add code to the hook before it is declared. An implicitly declared hook doesn't have arguments (in principle), so use `\c_false_bool` here.

```

652 \cs_new_protected:Npn \__hook_gput_undeclared_hook:nnn #1 #2 #3
653 {
654   \__hook_init_structure:n {#1}
655   \__hook_gput_code_do:nnn {#1} {#2} {#3}
656 }

```

(End of definition for `__hook_gput_undeclared_hook:nnn`.)

`__hook_try_declarng_generic_hook:nnn`
`__hook_try_declarng_generic_next_hook:nn`

These entry-level macros just pass the arguments along to the common `__hook_try_declarng_generic_hook:nNNnn` with the right functions to execute when some action is to be taken.

The wrapper `__hook_try_declarng_generic_hook:nnn` then defers `\hook_gput_code:nnn` if the generic hook was declared, or to `__hook_gput_undeclared_hook:nnn` otherwise (the hook was tested for existence before, so at this point if it isn't generic, it doesn't exist).

The wrapper `__hook_try_declarng_generic_next_hook:nn` for next-execution hooks does the same: it defers the code to `\hook_gput_next_code:nn` if the generic hook was declared, or to `__hook_gput_next_do:nn` otherwise.

(End of definition for \__hook_try_declaring_generic_hook:nnn and
 \__hook_try_declaring_generic_next_hook:nn)

\__hook_try_declaring_generic_hook:nNNnn now splits the hook name at the first /
(if any) and first checks if it is a file-specific hook (they require some normalization) using
\__hook_if_file_hook:wTF. If not then check it is one of a predefined set for generic
names. We also split off the second component to see if we have to make a reversed hook.
In either case the function returns \true for a generic hook and \false in other cases.

740       {

```

If the hook doesn't exist yet we check if it is a `cmd` hook and if so we attempt patching the command in addition to declaring the hook.

For some commands this will not be possible, in which case `__hook_patch_cmd-or_delay:Nnn` (defined in `ltcmdhooks`) will generate an appropriate error message.

```

741           \str_if_eq:nnT {#1} { cmd }
742           {
743             \__hook_try_put_cmd_hook:n {#5}
744             \__hook_make_usable:nn {#5} { 9 }
745             \use_none:nnn
746           }

```

Declare the hook always even if it can't really be used (error message generated elsewhere).

Here we use `__hook_make_usable:nn`, so that a `\hook_new:n` is still possible later. Generic hooks (except `cmd` hooks) take no arguments, so use zero as the second argument.

```

747           \__hook_make_usable:nn {#5} { 0 }
748         }
749         \__hook_if_generic_reversed:nT {#5}
750         { \tl_gset:cn { g__hook_#5_reversed_tl } { - } }

```

```

751         \prg_return_true:
752     }
753 {

```

Generic hooks are all named $\langle type \rangle / \langle name \rangle / \langle place \rangle$, where $\langle type \rangle$ and $\langle place \rangle$ are predefined ($\c_hook_generic_{\langle type \rangle} / . / \langle place \rangle_t1$), and $\langle name \rangle$ is the variable component. Older releases had some hooks with the $\langle name \rangle$ in the third part, so the code below supports that syntax for a while, with a warning.

The $\exp_after:wN \dots \exp:w$ trick is there to remove the conditional structure inserted by $_hook_try_declaring_generic_hook:wnTF$ and thus allow access to the tokens that follow it, as is needed to keep things going.

When the deprecation cycle ends, the lines below should all be replaced by $\prg_return_false:$.

```

754     \_hook_if_DEPRECATED_GENERIC:nTF {#5}
755     {
756         \_hook_DEPRECATED_GENERIC_WARN:n {#5}
757         \exp_after:wN \_hook_DECLARE_DEPRECATED_GENERIC:NNn
758         \exp:w % \exp_end:
759     }
760     { \prg_return_false: }
761 }
762 }

```

$_hook_DEPRECATED_GENERIC_WARN:n$ will issue a deprecation warning for a given hook, and mark that hook such that the warning will not be issued again (multiple warnings can be issued, but only once per hook).

```

763 \cs_new_protected:Npn \_hook_DEPRECATED_GENERIC_WARN:n #1
764     { \_hook_DEPRECATED_GENERIC_WARN:w #1 \s_hook_mark }
765 \cs_new_protected:Npn \_hook_DEPRECATED_GENERIC_WARN:w
766     #1 / #2 / #3 \s_hook_mark
767 {
768     \if_cs_exist:w \_hook~#1/#2/#3 \cs_end: \else:
769         \msg_warning:nnnn { hooks } { generic-deprecated } {#1} {#2} {#3}
770     \fi:
771     \cs_gset_eq:cN { \_hook~#1/#2/#3 } \scan_stop:
772 }

```

Now that the user has been told about the deprecation, we proceed by swapping $\langle name \rangle$ and $\langle place \rangle$ and adding the code to the correct hook.

957  \langle latexrelease \rangle                               {Hooks~with~args}
958  \langle latexrelease \rangle \EndIncludeInRelease

(End of definition for \c__hook_parameter_cmd./before_tl and
 \c__hook_parameter_cmd./after_tl.)

```

\hook_gremove_code:nn With \hook_gremove_code:nn{\hook}{\label} any code for \hook stored under \label is removed.

```

959  \langle latexrelease \rangle \IncludeInRelease{2023/06/01}{\hook_gremove_code:nn}
960  \langle latexrelease \rangle                               {Hooks~with~args}
961  \cs_new_protected:Npn \hook_gremove_code:nn #1 #2
962    { \_hook_normalize_hook_args:Nnn \_hook_gremove_code:nn {#1} {#2} }
963  \cs_new_protected:Npn \_hook_gremove_code:nn #1 #2
964    {

```

First check that the hook code pool exists. _hook_if_usable:nTF isn't used here because it should be possible to remove code from a hook before its defined (see section 2.1.8).

```

965      \_hook_if_structure_exist:nTF {#1}
966      {

```

Then remove the chunk and run _hook_update_hook_code:n so that the execution token list reflects the change if we are after \begin{document}.

If all code is to be removed, clear the code pool \g__hook_<hook>_code_prop, the top-level code _hook_toplevel_<hook>, and the next-execution code _hook_next_<hook>.

```

967      \str_if_eq:nnTF {#2} {*}
968      {
969        \prop_gclear:c { g__hook_#1_code_prop }
970        \_hook_toplevel_gset:nn {#1} { }
971        \_hook_next_gset:nn {#1} { }
972      }
973      {

```

If the label is top-level then clear the token list, as all code there is under the same label.

```

974          \str_if_eq:nnTF {#2} { top-level }
975          {
976            \_hook_toplevel_gset:nn {#1} { }
977            \prop_gpop:cnNF { g__hook_#1_code_prop }
978            {#2} \l__hook_return_tl
979            { \msg_warning:nnnn { hooks } { cannot-remove } {#1} {#2} }
980          }
981        }

```

Finally update the code, if the hook exists.

```

982          \_hook_if_usable:nT {#1}
983          {
984            \_hook_update_hook_code:n {#1}
985          }

```

If the code pool for this hook doesn't exist, show a warning:

```

985          {
986            \_hook_if_deprecated_generic:nTF {#1}
987            {

```

```

988         \__hook_deprecated_generic_warn:n {#1}
989         \__hook_do_DEPRECATED_GENERIC:Nn
990             \__hook_gremove_code:nn {#1} {#2}
991     }
992     { \msg_warning:nnnn { hooks } { cannot-remove } {#1} {#2} }
993 }
994 }

\__hook_code_gset_auxi:nnnn
\__hook_code_gset_auxi:eeen

```

This macro is used to append code to the `toplevel` and `next` token lists, treating them correctly depending on their number of arguments, and depending on whether the code being added should have parameter tokens understood as parameters, or doubled to be stored as parameter tokens.

```
1033 \IncludeInRelease{2023/06/01}{\__hook_cs_gput_right:nnn}
```

```

1034  <|latexrelease>           {Hooks~with~args}
      Check if the current hook is declared and takes no arguments. In this case, we short-
      circuit and use the simpler and much faster approach that doesn't require hash-doubling.
1035 \cs_new_protected:Npn \__hook_cs_gput_right:nnn #1 #2
1036   {
1037     \if:w T
1038       \__hook_if_declared:nF {#2} { F }
1039       \tl_if_empty:cF { c__hook_#2_parameter_tl } { F }
1040       T
1041       \exp_after:wN \__hook_cs_gput_right_fast:nnn
1042     \else:
1043       \exp_after:wN \__hook_cs_gput_right_slow:nnn
1044     \fi:
1045       {#1} {#2}
1046   }
1047 \cs_new_protected:Npn \__hook_cs_gput_right_fast:nnn #1 #2 #3
1048   { \cs_gset:cpx { __hook#1~#2 }
1049     { \exp_not:v { __hook#1~#2 } \exp_not:n {#3} } }
1050 \cs_new_protected:Npn \__hook_cs_gput_right_slow:nnn #1 #2 #3
1051   {

```

The auxiliary `__hook_code_gset_auxi:eeen` just does the assignment at the end. Its first argument is the parameter text of the macro, which is chosen here depending if `\c__hook_{hook}_parameter_tl` exists, if the hook is declared, and if it's a generic hook.

```

1052 \cs_if_exist:cF { __hook#1~#2 }
1053   { \__hook_code_gset_aux:nnn {#1} {#2} { } }
1054 \__hook_code_gset_auxi:eeen
1055   {
1056     \__hook_if_declared:nTF {#2}
1057     { \tl_use:c { c__hook_#2_parameter_tl } }
1058     {
1059       \__hook_if_generic:nTF {#2}
1060         { \__hook_generic_parameter:n {#2} }
1061         { \c__hook_nine_parameters_tl }
1062     }
1063   }

```

Here we take the existing code in the macro, expand it with as many arguments as it takes, then double the hashes so the code can be reused.

```

1064   {
1065     \exp_args:NNo \exp_args:No \__hook_double_hashes:n
1066     {
1067       \cs:w __hook#1~#2 \exp_last_unbraced:Ne \cs_end:
1068         { \__hook_braced_cs_parameter:n { __hook#1~#2 } }
1069     }
1070   }

```

Now the new code: if we are replacing arguments, then hashes are left untouched, otherwise they are doubled.

```

1071   {
1072     \__hook_if_replacing_args:TF
1073       { \exp_not:n }
1074       { \__hook_double_hashes:n }
1075       {#3}
1076   }

```

And finally, the csname which we'll define with all the above.

```
1077     { __hook#1~#2 }
1078 }
```

And as promised, the auxiliary that does the definition.

```
1079 \cs_new_protected:Npn \__hook_code_gset_auxi:nnnn #1 #2 #3 #4
1080   { \cs_gset:cpn {#4} #1 { #2 #3 } }

1136 〈\latexrelease〉\EndIncludeInRelease

(End of definition for \__hook_normalise_cs_args:nn.)

```

__hook_normalise_code_pool:n
__hook_set_normalise_fn:nn

This one's a bit of a hack. It takes a hook, and iterates over its code pool ($\text{\g__hook_}\langle\text{hook}\rangle\text{_code_prop}$), redefining each code label to use only valid arguments. This is used when, for example, a code is added referencing arguments #1 and #2, but the hook has only #1. In this example, every reference to #2 is changed to ##2. This is done because otherwise TeX will throw a low-level error every time some change happens to the hook (code is added, a rule is set, etc), which can get quite repetitive for no good reason.

```

1137 〈\latexrelease〉\IncludeInRelease{2023/06/01}{\__hook_normalise_code_pool:n}
1138 〈\latexrelease〉          {Hooks~with~args}
1139  \cs_new_protected:Npn \__hook_normalise_code_pool:n #1
1140  {

```

First, call $\text{__hook_set_normalise_fn:nn}$ with the hook name to set everything up, then we'll loop over the hook's code pool applying the normalization above. After that's done, copy the temporary property list back to the hook's.

```

1141  \__hook_set_normalise_fn:nn {#1} { Offending-label:~'##1' }
1142  \prop_clear:N \l__hook_work_prop
1143  \prop_map_function:cN { g__hook_#1_code_prop } \__hook_normalise_fn:nn
1144  \prop_gset_eq:cN { g__hook_#1_code_prop } \l__hook_work_prop
1145  }

```

The sole purpose of this function is to define $\text{__hook_normalise_fn:nn}$, which will then do the correcting of the code being added to the hook.

```

1146  \cs_new_protected:Npn \__hook_set_normalise_fn:nn #1 #2
1147  {

```

To start, we define two auxiliary token lists. \l__hook_tmpb_tl contains:

```

{\c__hook_hashes_tl 1}
{\c__hook_hashes_tl 2}
...
{\c__hook_hashes_tl 9}

1148   \cs_set:Npn \__hook_tmp:w ##1##2##3##4##5##6##7##8##9 { }
1149   \tl_set:Ne \l__hook_tmpb_tl
1150     { \__hook_braced_cs_parameter:n { __hook_tmp:w } }
1151   \group_begin:
1152     \__hook_tl_set:cn { c__hook_hash_tl } { \exp_not:N \c__hook_hashes_tl }
1153     \use:e
1154     {
1155   \group_end:
1156   \tl_set:Nn \exp_not:N \l__hook_tmpb_tl { \l__hook_tmpb_tl }
1157 }

```

And `\l__hook_tmpa_tl` contains:

```

{\c__hook_hash_tl 1}
{\c__hook_hash_tl 2}
...
{\c__hook_hash_tl <n>}

```

with `<n>` being the number of arguments declared for the hook.

```

1158   \exp_last_unbraced:Nnf
1159   \cs_set:Npn \__hook_tmp:w { \__hook_parameter:n {#1} } { }
1160   \tl_set:Ne \l__hook_tmpa_tl
1161     { \__hook_braced_cs_parameter:n { __hook_tmp:w } }

```

Now this function does the fun part. It is meant to be used with `\prop_map_function:NN`, taking a label name in `#1` and the code stored in that label in `#2`.

```

1162   \cs_gset_protected:Npx \__hook_normalise_fn:nn ##1 ##2
1163   {

```

Here we'll define two auxiliary macros: the first one throws an error when it detects an invalid argument reference. It piggybacks on TeX's low-level "Illegal parameter number" error, but it defines a weirdly-named control sequence so that the error comes out nicely formatted. For example, if the label "badpkg" adds some code that references argument #3 in the hook "foo", which takes only two arguments, the error will be:

```

! Illegal parameter number in definition of hook 'foo'.
(hooks)           Offending label: 'badpkg'.
<to be read again>
3

```

At the point of this definition, the error is raised if the code happens to reference an invalid argument. If it was possible to detect that this definition raised no error, the next step would be unnecessary. We'll do all this in a group so this weird definition doesn't leak out, and set `\tex_escapechar:D` to `-1` so this hack shows up extra nice in the case of an error.

```

1164   \group_begin:
1165     \int_set:Nn \tex_escapechar:D { -1 }
1166     \cs_set:cpn
1167       {
1168         hook~'#1'. ^^J

```

```

1169             (hooks) \prg_replicate:nn { 13 } { ~ }
1170             #2 % more message text
1171         }
1172         \exp_not:v { c__hook_#1_parameter_tl }
1173     {##2}
1174 \group_end:

```

This next macro, with a much less fabulous name, takes always nine arguments, and it just transfers the code `##2` under the label `##1` to the temporary property list. The first $\langle n \rangle$ arguments are taken from `\l__hook_tmpa_tl`, and the other $9 - \langle n \rangle$ taken from `\l__hook_tmpb_tl` (which contains twice as many # tokens as the former). Then, `__hook_double_hashes:n` is used to double non-argument hashes, and expand the `\c__hook_hash_tl` and `\c__hook_hashes_tl` to the actual parameter tokens.

```

1175     \cs_set:Npn \exp_not:N \__hook_tmp:w
1176         \exp_not:V \c__hook_nine_parameters_tl
1177     {

`__hook_braced_hidden_loop:w`
`__hook_cs_parameter_count:N`
`__hook_cs_parameter_count:w`
`__hook_cs_end:w`

Looks at the `<parameter text>` of a control sequence, and returns a run of “hidden” braced parameters for that macro. This works as long as the macros take a simple run of zero to nine arguments. The parameters are “hidden” because the parameter tokens are returned inside `\c___hook_hash_t1` instead of explicitly, so that `__hook_double_hashes:n` won’t touch these.

4.7 Setting rules for hooks code

```
\g__hook_??_code_prop
  \__hook-??
\g__hook_??_reversed_tl
\c__hook_??_parameter_tl
```

Initially these variables simply used an empty “label” name (not two question marks). This was a bit unfortunate, because then l3doc complains about `--` in the middle of a command name when trying to typeset the documentation. However using a “normal” name such as `default` has the disadvantage of that being not really distinguishable from a real hook name. I now have settled for `??` which needs some gymnastics to get it into the csname, but since this is used a lot, the code should be fast, so this is not done with `c` expansion in the code later on.

`__hook-??` isn’t used, but it has to be defined to trick the code into thinking that `??` is actually a hook.

```

1293 \prop_new:c { g__hook_??_code_prop }
1294 \prop_new:c { __hook-?? }
```

Default rules are always given in normal ordering (never in reversed ordering). If such a rule is applied to a reversed hook it behaves as if the rule is reversed (e.g., `after` becomes `before`) because those rules are applied first and then the order is reversed.

```
1295 \tl_new:c { g__hook_??_reversed_tl }
```

The parameter text for the “default” hook is empty.

```

1296 ⟨latexrelease⟩\IncludeInRelease{2023/06/01}{\c__hook_??_parameter_tl}

1303 ⟨latexrelease⟩\EndIncludeInRelease
```

(End of definition for `\g__hook_??_code_prop` and others.)

```
\hook_gset_rule:nnnn
\__hook_gset_rule:nnnn
```

With `\hook_gset_rule:nnnn{⟨hook⟩}{⟨label1⟩}{⟨relation⟩}{⟨label2⟩}` a relation is defined between the two code labels for the given `⟨hook⟩`. The special hook `??` stands for *any* hook, which sets a default rule (to be used if no other relation between the two hooks exist).

```

1304 \cs_new_protected:Npn \hook_gset_rule:nnnn #1#2#3#4
1305   {
1306     \__hook_normalize_hook_rule_args:Nnnnn \__hook_gset_rule:nnnn
1307     {#1} {#2} {#3} {#4}
1308   }
1309 ⟨latexrelease⟩\IncludeInRelease{2022/06/01}{\__hook_gset_rule:nnnn}
1310 ⟨latexrelease⟩                                {Refuse-setting-rule-for-one-time-hooks}
1311 \cs_new_protected:Npn \__hook_gset_rule:nnnn #1#2#3#4
1312   {
1313     \__hook_if_deprecated_generic:nT {#1}
1314     {
1315       \__hook_deprecated_generic_warn:n {#1}
```

```

1316         \__hook_do_deprecated_generic:Nn \__hook_gset_rule:nnnn {#1}
1317             {#2} {#3} {#4}
1318             \__hook_use_none_delimit_by_s_mark:w
1319         }
1320     \__hook_if_execute_immediately:nT {#1}
1321     {

```

(End of definition for `\hook_gset_rule:nnn` and `_hook_gset_rule:nnn`. This function is documented on page 214.)

```
\_hook_rule_before_gset:nnn
\hook_rule_after_gset:nnn
\hook_rule_<_gset:nnn
\hook_rule_>_gset:nnn
```

Then we add the new rule. We need to normalize the rules here to allow for faster processing later. Given a pair of labels l_A and l_B , the rule $l_A > l_B$ is the same as $l_B < l_A$ only presented differently. But by normalizing the forms of the rule to a single representation, say, $l_B < l_A$, reduces the time spent looking for the rules later considerably.

Here we do that normalization by using `\(pdf)strcmp` to lexically sort labels l_A and l_B to a fixed order. This order is then enforced every time these two labels are used together.

Here we use `_hook_label_pair:nn {<hook>} {<l_A>} {<l_B>}` to build a string $l_B | l_A$ with a fixed order, and use `_hook_label_ordered:nnTF` to apply the correct rule to the pair of labels, depending if it was sorted or not.

```
1364 \cs_new_protected:Npn \_hook_rule_before_gset:nnn #1#2#3
1365   {
1366     \_hook_tl_gset:cx

1391     { g_hook_#1_rule_ \_hook_label_pair:nn {#2} {#3} _tl }
1392     { xW }
1393   }
```

(End of definition for `_hook_rule_incompatible-error_gset:nnn` and `_hook_rule_incompatible-warning_gset:nnn`.)

<code>__hook_rule_unrelated_gset:nnn</code>	Undo a setting. <code>__hook_rule_unrelated_gset:nnn</code> doesn't need to do anything, since we use <code>__hook_rule_gclear:nnn</code> before setting any rule.
	<pre>1394 \cs_new_protected:Npn __hook_rule_unrelated_gset:nnn #1#2#3 { } 1395 \cs_new_protected:Npn __hook_rule_gclear:nnn #1#2#3 1396 { \cs_undefine:c { g___hook_\#1_rule_ __hook_label_pair:nn {#2} {#3} _t1 } }</pre> <p>(End of definition for <code>__hook_rule_unrelated_gset:nnn</code> and <code>__hook_rule_gclear:nnn</code>.)</p>
<code>__hook_label_pair:nn</code>	Ensure that the lexically greater label comes first.
	<pre>1397 \cs_new:Npn __hook_label_pair:nn #1#2 1398 { 1399 \if_case:w __hook_str_compare:nn {#1} {#2} \exp_stop_f: 1400 #1 #1 % 0 1401 \or: #1 #2 % +1 1402 \else: #2 #1 % -1 1403 \fi: 1404 }</pre> <p>(End of definition for <code>__hook_label_pair:nn</code>.)</p>
<code>__hook_label_ordered_p:nn</code> <code>__hook_label_ordered:nnTF</code>	Check that labels #1 and #2 are in the correct order (as returned by <code>__hook_label_pair:nn</code>) and if so return true, else return false.
	<pre>1405 \prg_new_conditional:Npnn __hook_label_ordered:nn #1#2 { TF } 1406 { 1407 \if_int_compare:w __hook_str_compare:nn {#1} {#2} > 0 \exp_stop_f: 1408 \prg_return_true: 1409 \else: 1410 \prg_return_false: 1411 \fi: 1412 }</pre> <p>(End of definition for <code>__hook_label_ordered:nnTF</code>.)</p>
<code>__hook_if_label_case:nnnn</code>	To avoid doing the string comparison twice in <code>__hook_initialize_single:NNn</code> (once with <code>\str_if_eq:nn</code> and again with <code>__hook_label_ordered:nn</code>), we use a three-way branching macro that will compare #1 and #2 and expand to <code>\use_i:nnn</code> if they are equal, <code>\use_ii:nn</code> if #1 is lexically greater, and <code>\use_iii:nn</code> otherwise.
	<pre>1413 \cs_new:Npn __hook_if_label_case:nnnnn #1#2 1414 { 1415 \cs:w use_ 1416 \if_case:w __hook_str_compare:nn {#1} {#2} 1417 i \or: ii \else: iii \fi: :nnn 1418 \cs_end: 1419 }</pre> <p>(End of definition for <code>__hook_if_label_case:nnnnn</code>.)</p>
<code>__hook_update_hook_code:n</code>	Before <code>\begin{document}</code> this does nothing, in the body it reinitializes the hook code using the altered data.
	<pre>1420 \cs_new_eq:NN __hook_update_hook_code:n \use_none:n</pre> <p>(End of definition for <code>__hook_update_hook_code:n</code>.)</p>

__hook_initialize_all: Initialize all known hooks (at \begin{document}), i.e., update the fast execution token lists to hold the necessary code in the right order.

```
1421 <latexrelease>\IncludeInRelease{2023/06/01}{\_\_hook_initialize_all:}
1422 <latexrelease>                                {Hooks~with-args}
1423 \cs_new_protected:Npn \_\_hook_initialize_all:
1424     {
```

First we change __hook_update_hook_code:n which so far was a no-op to now initialize one hook. This way any later updates to the hook will run that code and also update the execution token list.

```
1425     \cs_gset_eq:NN \_\_hook_update_hook_code:n \_\_hook_initialize_hook_code:n
```

Now we loop over all hooks that have been defined and update each of them. Here we have to determine if the hook has arguments so that auxiliaries know what to do with hashes. We look at \c_hook_{hook}_parameter_tl, if it has any parameters, and set replacing_args accordingly.

```
1426     \_\_hook_debug:n { \prop_gclear:N \g\_hook_used_prop }
1427     \seq_map_inline:Nn \g\_hook_all_seq
1428     {
1429         \tl_if_empty:cTF { c\_hook\_##1\_parameter\_tl }
1430             { \_\_hook_replacing_args_false: }
1431             { \_\_hook_replacing_args_true: }
1432             \_\_hook_update_hook_code:n {##1}
1433             \_\_hook_replacing_args_reset:
1434     }
```

If we are debugging we show results hook by hook for all hooks that have data.

```
1435     \_\_hook_debug:n
1436     {
1437         \iow_term:x { ^^J[lthooks]~ All~initialized~(non-empty)~hooks: }
1438         \prop_map_inline:Nn \g\_hook_used_prop
1439         {
1440             \iow_term:x
1441             { ^^J ~ ##1 ~ -> ~ \cs_replacement_spec:c { __hook~##1 } ~ }
1442         }
1443     }
```

After all hooks are initialized we change the “use” to just call the hook code and not initialize it (as this was already done in the preamble).

```
1444     \_\_hook_post_initialization_defs:
1445 }
1446 <latexrelease>\EndIncludeInRelease

1473 ⟨latexrelease⟩ \EndIncludeInRelease

(End of definition for \__hook_initialize_all:.)
```

__hook_initialize_hook_code:n

Initializing or reinitializing the fast execution hook code. In the preamble this is selectively done in case a hook gets used and at \begin{document} this is done for all hooks and afterwards only if the hook code changes.

```

1474 ⟨latexrelease⟩ \IncludeInRelease{2023/06/01}{\__hook_initialize_hook_code:n}
1475 ⟨latexrelease⟩           {Hooks-with-args}
1476 \cs_new_protected:Npn \__hook_initialize_hook_code:n #1
1477   {
1478     \__hook_debug:n
1479     { \iow_term:x { ^~J[lthooks]~ Update~code~for~hook~'#1' \online :^~J } }
```

This does the sorting and the updates. First thing we do is to check if a legacy hook macro exists and if so we add it to the hook under the label `legacy`. This might make the hook non-empty so we have to do this before the then following test.

```
1480   \__hook_include_legacy_code_chunk:n #1}
```

If there aren't any code chunks for the current hook, there is no point in even starting the sorting routine so we make a quick test for that and in that case just update __hook_{hook} to hold the top-level and next code chunks. If there are code chunks we call __hook_initialize_single:NNn and pass to it ready made csnames as they are needed several times inside. This way we save a bit on processing time if we do that up front.

```

1481 \__hook_if_usable:nT {#1}
1482 {
1483   \prop_if_empty:cTF { g__hook_#1_code_prop }
1484   {
1485     \__hook_code_gset:ne {#1}
1486     {
```

The hook may take arguments, so we add a run of braced parameters after the `_next` and `_toplevel` macros, so that the arguments passed to the hook are forwarded to them.

```

1487   \exp_not:c { __hook_toplevel~#1 }
1488   \__hook_braced_parameter:n {#1}
1489   \exp_not:c { __hook_next~#1 }
1490   \__hook_braced_parameter:n {#1}
1491 }
1492 }
```

By default the algorithm sorts the code chunks and then saves the result in a token list for fast execution; this is done by adding the code chunks one after another, using `\tl_gput_right:N`. When we sort code for a reversed hook, all we have to do is to add the code chunks in the opposite order into the token list. So all we have to do in preparation is to change two definitions that are used later on.

```

1494     \__hook_if_reversed:nTF {#1}
1495     { \cs_set_eq:NN \__hook_tl_gput:Nn      \__hook_tl_gput_left:Nn
1496       \cs_set_eq:NN \__hook_clist_gput:NV \clist_gput_left:NV }
1497     { \cs_set_eq:NN \__hook_tl_gput:Nn      \__hook_tl_gput_right:Nn
1498       \cs_set_eq:NN \__hook_clist_gput:NV \clist_gput_right:NV }

```

When sorting, some relations (namely `voids`) need to act destructively on the code property lists to remove code that shouldn't appear in the sorted hook token list, so we make a copy of the code property list that we can safely work on without changing the main one.

```

1499     \prop_set_eq:Nc \l__hook_work_prop { g__hook_#1_code_prop }
1500     \__hook_initialize_single:ccn
1501     { __hook~#1 } { g__hook_#1_labels_clist } {#1}

```

For debug display we want to keep track of those hooks that actually got code added to them, so we record that in plist. We use a plist to ensure that we record each hook name only once, i.e., we are only interested in storing the keys and the value is arbitrary.

```

1502     \__hook_debug:n
1503     { \exp_args:NNx \prop_gput:Nnn \g__hook_used_prop {#1} { } }
1504   }
1505   }
1506 }

```

(End of definition for `__hook_initialize_hook_code:n`.)

`__hook_tl_csname:n` It is faster to pass a single token and expand it when necessary than to pass a bunch of character tokens around.
`__hook_seq_csname:n`

FMi: note to myself: verify

```

1547 \cs_new:Npn \__hook_tl_csname:n #1 { l__hook_label_#1_tl }
1548 \cs_new:Npn \__hook_seq_csname:n #1 { l__hook_label_#1_seq }

```

(End of definition for `__hook_tl_csname:n` and `__hook_seq_csname:n`.)

`\l__hook_labels_seq`
`\l__hook_labels_int`
`\l__hook_front_tl`
`\l__hook_rear_tl`
`\l__hook_label_0_tl`

For the sorting I am basically implementing Knuth's algorithm for topological sorting as given in TAOCP volume 1 pages 263–266. For this algorithm we need a number of local variables:

- List of labels used in the current hook to label code chunks:

```
1549 \seq_new:N \l__hook_labels_seq
```

- Number of labels used in the current hook. In Knuth's algorithm this is called N :

```
1550 \int_new:N \l__hook_labels_int
```

- The sorted code list to be build is managed using two pointers one to the front of the queue and one to the rear. We model this using token list pointers. Knuth calls them F and R :

```

1551 \tl_new:N \l__hook_front_tl
1552 \tl_new:N \l__hook_rear_tl

```

- The data for the start of the queue is kept in this token list, it corresponds to what Don calls `QLINK[0]` but since we aren't manipulating individual words in memory it is slightly differently done:

```
1553 \tl_new:c { \__hook_tl_csname:n { 0 } }
```

(End of definition for `\l__hook_labels_seq` and others.)

__hook_initialize_single:N_n
__hook_initialize_single:c_n

__hook_initialize_single:N_n implements the sorting of the code chunks for a hook and saves the result in the token list for fast execution (#4). The arguments are *<hook-code-plist>*, *<hook-code-tl>*, *<hook-top-level-code-tl>*, *<hook-next-code-tl>*, *<hook-ordered-labels-clist>* and *<hook-name>* (the latter is only used for debugging—the *<hook-rule-plist>* is accessed using the *<hook-name>*).

The additional complexity compared to Don's algorithm is that we do not use simple positive integers but have arbitrary alphanumeric labels. As usual Don's data structures are chosen in a way that one can omit a lot of tests and I have mimicked that as far as possible. The result is a restriction I do not test for at the moment: a label can't be equal to the number 0!

FMi: Needs checking for, just in case ... maybe

```
1554 <|latexrelease>\IncludeInRelease{2023/06/01}{\_\_hook\_initialize\_single:Nn}
1555 <|latexrelease>
1556 \cs_new_protected:Npn \_\_hook_initialize_single:Nn #1#2#3
1557 {
```

Step T1: Initialize the data structure ...

```
1558 \seq_clear:N \l_\_hook_labels_seq
1559 \int_zero:N \l_\_hook_labels_int
```

Store the name of the hook:

```
1560 \tl_set:Nn \l_\_hook_cur_hook_tl {#3}
```

We loop over the property list holding the code and record all the labels listed there. Only the rules for those labels are of interest to us. While we are at it we count them (which gives us the *N* in Knuth's algorithm). The prefix `label_` is added to the variables to ensure that labels named `front`, `rear`, `labels`, or `return` don't interact with our code.

```
1561 \prop_map_inline:Nn \l_\_hook_work_prop
1562 {
1563     \int_incr:N \l_\_hook_labels_int
1564     \seq_put_right:Nn \l_\_hook_labels_seq {##1}
1565     \_\_hook_tl_set:cn { \_\_hook_tl_csname:n {##1} } { 0 }
1566     \seq_clear_new:c { \_\_hook_seq_csname:n {##1} }
1567 }
```

Steps T2 and T3: Here we sort the relevant rules into the data structure...

This loop constitutes a square matrix of the labels in `\l__hook_work_prop` in the vertical and the horizontal directions. However, since the rule $l_A \langle rel \rangle l_B$ is the same as $l_B \langle rel \rangle^{-1} l_A$ we can cut the loop short at the diagonal of the matrix (*i.e.*, when both labels are equal), saving a good amount of time. The way the rules were set up (see the implementation of `__hook_rule_before_gset:nnn` above) ensures that we have no rule in the ignored side of the matrix, and all rules are seen. The rules are applied in `__hook_apply_label_pair:nnn`, which takes the properly-ordered pair of labels as argument.

```
1568 \prop_map_inline:Nn \l_\_hook_work_prop
1569 {
1570     \prop_map_inline:Nn \l_\_hook_work_prop
1571     {
1572         \_\_hook_if_label_case:nnnnn {##1} {####1}
1573         { \prop_map_break: }
1574         { \_\_hook_apply_label_pair:nnn {##1} {####1} }
1575         { \_\_hook_apply_label_pair:nnn {####1} {##1} }
```

```

1576          {##3}
1577      }
1578  }

```

Now take a breath, and look at the data structures that have been set up:

```

1579     \_\_hook\_debug:n { \_\_hook\_debug\_label\_data:N \l\_hook\_work\_prop }
Step T4:

```

```

1580     \tl_set:Nn \l\_hook\_rear_tl { 0 }
1581     \tl_set:cn { \_\_hook_tl_cname:n { 0 } } { 0 }
1582     \seq_map_inline:Nn \l\_hook_labels_seq
1583     {
1584         \int_compare:nNnT { \cs:w \_\_hook_tl_cname:n {##1} \cs_end: } = 0
1585         {
1586             \tl_set:cn { \_\_hook_tl_cname:n { \l\_hook_rear_tl } }{##1}
1587             \tl_set:Nn \l\_hook_rear_tl {##1}
1588         }
1589     }
1590     \tl_set_eq:Nc \l\_hook_front_tl { \_\_hook_tl_cname:n { 0 } }
1591     \_\_hook_tl_gclear:N #1
1592     \clist_gclear:N #2

```

The whole loop gets combined in steps T5–T7:

```

1593     \bool_while_do:nn { ! \str_if_eq_p:Vn \l\_hook_front_tl { 0 } }
1594     {

```

This part is step T5:

```

1595         \int_decr:N \l\_hook_labels_int
1596         \prop_get:NVN \l\_hook_work_prop \l\_hook_front_tl \l\_hook_return_tl
1597         \exp_args:NNV \_\_hook_tl_gput:Nn #1 \l\_hook_return_tl
1598
1599         \_\_hook_clist_gput:NV #2 \l\_hook_front_tl
         \_\_hook_debug:n{ \iow_term:x{[lthooks]~ Handled~ code~ for~ \l\_hook_front_tl} }

```

This is step T6, except that we don't use a pointer P to move through the successors, but instead use ##1 of the mapping function.

```

1600     \seq_map_inline:cn { \_\_hook_seq_cname:n { \l\_hook_front_tl } }
1601     {
1602         \tl_set:cx { \_\_hook_tl_cname:n {##1} }
1603         {
1604             \int_eval:n
1605                 { \cs:w \_\_hook_tl_cname:n {##1} \cs_end: - 1 }
1606         }
1607         \int_compare:nNnT
1608             { \cs:w \_\_hook_tl_cname:n {##1} \cs_end: } = 0
1609             {
1610                 \tl_set:cn
1611                     { \_\_hook_tl_cname:n { \l\_hook_rear_tl } }{##1}
1612                     \tl_set:Nn \l\_hook_rear_tl {##1}
1613             }
1614     }

```

and here is step T7:

```

1614     \tl_set_eq:Nc \l\_hook_front_tl
1615         { \_\_hook_tl_cname:n { \l\_hook_front_tl } }

```

This is step T8: If we haven't moved the code for all labels (i.e., if `\l__hook_labels_int` is still greater than zero) we have a loop and our partial order can't be flattened out.

```

1616     }
1617     \int_compare:nNnF \l__hook_labels_int = 0
1618     {

```

1621     \__hook_debug_label_data:N \l__hook_work_prop
1622     \iow_term:x{=====}
1623 }

```

After we have added all hook code to #1, we finish it off by adding extra code for the top-level (#2) and for one time execution (#3). These should normally be empty. The top-level code is added with `__hook_tl_gput:Nn` as that might change for a reversed hook (then top-level is the very first code chunk added). The next code is always added last (to the right). The hook may take arguments, so we add a run of braced parameters after the `_next` and `_toplevel` macros, so that the arguments passed to the hook are forwarded to them.

```

```

(End of definition for `_hook_initialize_single:Nnn.`)

`_hook_tl_gput:Nn` These append either on the right (normal hook) or on the left (reversed hook). This is setup up in `_hook_initialize_hook_code:n`, elsewhere their behavior is undefined.

```

1719 \cs_new:Npn \_hook_tl_gput:Nn { \ERROR }
1720 \cs_new:Npn \_hook_clist_gput:NV { \ERROR }

```

(End of definition for `_hook_tl_gput:Nn` and `_hook_clist_gput:NV.`)

`_hook_apply_label_pair:nnn` This is the payload of steps T2 and T3 executed in the loop described above. This macro assumes #1 and #2 are ordered, which means that any rule pertaining the pair #1 and #2 is `\g__hook_{hook}_rule:#1|#2_t1`, and not `\g__hook_{hook}_rule:#2|#1_t1`. This also saves a great deal of time since we only need to check the order of the labels once.

The arguments here are `\label1`, `\label2`, `\hook`, and `\hook-code-plist`. We are about to apply the next rule and enter it into the data structure. `_hook_apply_label_pair:nnn` will just call `_hook_label_if_exist_apply:nnnF` for the `\hook`, and if no rule is found, also try the `\hook` name ?? denoting a default hook rule.

`_hook_label_if_exist_apply:nnnF` will check if the rule exists for the given hook, and if so call `_hook_apply_rule:nnn`.

```

1721 \cs_new_protected:Npn \_hook_apply_label_pair:nnn #1#2#3
1722   {

```

Extra complication: as we use default rules and local hook specific rules we first have to check if there is a local rule and if that exist use it. Otherwise check if there is a default rule and use that.

```

1723   \_hook_label_if_exist_apply:nnnF {#1} {#2} {#3}
1724   {

```

If there is no hook-specific rule we check for a default one and use that if it exists.

```

1725     \_hook_label_if_exist_apply:nnnF {#1} {#2} {?? } { }
1726   }
1727 }
1728 \cs_new_protected:Npn \_hook_label_if_exist_apply:nnnF #1#2#3
1729   {
1730     \if_cs_exist:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end:

```

What to do precisely depends on the type of rule we have encountered. If it is a `before` rule it will be handled by the algorithm but other types need to be managed differently. All this is done in `_hook_apply_rule:nnnN`.

```

1731   \_hook_apply_rule:nnn {#1} {#2} {#3}
1732   \exp_after:wN \use_none:n

```

```

1733     \else:
1734         \use:nn
1735     \fi:
1736 }

```

(End of definition for `_hook_apply_label_pair:nnn` and `_hook_label_if_exist_apply:nnnF`.)

`_hook_apply_rule:nnn`

This is the code executed in steps T2 and T3 while looping through the matrix. This is part of step T3. We are about to apply the next rule and enter it into the data structure. The arguments are `\label1`, `\label2`, `\hook-name`, and `\hook-code-plist`.

```

1737 \cs_new_protected:Npn \_hook_apply_rule:nnn #1#2#3
1738 {
1739     \cs:w __hook_apply_
1740     \cs:w g__hook_#3_reversed_tl \cs_end: rule_
1741     \cs:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end: :nnn \cs_end:
1742     {#1} {#2} {#3}
1743 }

```

(End of definition for `_hook_apply_rule:nnn`.)

`_hook_apply_rule_<:nnn`
`_hook_apply_rule_>:nnn`

The most common cases are `<` and `>` so we handle that first. They are relations \prec and \succ in TAOCP, and they dictate sorting.

```

1744 \cs_new_protected:cpn { __hook_apply_rule_<:nnn } #1#2#3
1745 {
1746     \__hook_debug:n { \__hook_msg_pair_found:nnn {#1} {#2} {#3} }
1747     \tl_set:cx { \__hook_tl_cname:n {#2} }
1748     { \int_eval:n{ \cs:w \__hook_tl_cname:n {#2} \cs_end: + 1 } }
1749     \seq_put_right:cn{ \__hook_seq_cname:n {#1} }{#2}
1750 }
1751 \cs_new_protected:cpn { __hook_apply_rule_>:nnn } #1#2#3
1752 {
1753     \__hook_debug:n { \__hook_msg_pair_found:nnn {#1} {#2} {#3} }
1754     \tl_set:cx { \__hook_tl_cname:n {#1} }
1755     { \int_eval:n{ \cs:w \__hook_tl_cname:n {#1} \cs_end: + 1 } }
1756     \seq_put_right:cn{ \__hook_seq_cname:n {#2} }{#1}
1757 }

```

(End of definition for `_hook_apply_rule_<:nnn` and `_hook_apply_rule_>:nnn`.)

`_hook_apply_rule_xE:nnn`
`_hook_apply_rule_xW:nnn`

These relations make two labels incompatible within a hook. `xE` makes raises an error if the labels are found in the same hook, and `xW` makes it a warning.

```

1758 \cs_new_protected:cpn { __hook_apply_rule_xE:nnn } #1#2#3
1759 {
1760     \__hook_debug:n { \__hook_msg_pair_found:nnn {#1} {#2} {#3} }
1761     \msg_error:nnnnn { hooks } { labels-incompatible }
1762     {#1} {#2} {#3} { 1 }
1763     \use:c { __hook_apply_rule_>:nnn } {#1} {#2} {#3}
1764     \use:c { __hook_apply_rule_<:nnn } {#1} {#2} {#3}
1765 }
1766 \cs_new_protected:cpn { __hook_apply_rule_xW:nnn } #1#2#3
1767 {
1768     \__hook_debug:n { \__hook_msg_pair_found:nnn {#1} {#2} {#3} }
1769     \msg_warning:nnnnn { hooks } { labels-incompatible }
1770     {#1} {#2} {#3} { 0 }
1771 }

```

(End of definition for `__hook_apply_rule_xE:nnn` and `__hook_apply_rule_xW:nnn`.)

`__hook_apply_rule_>:nnn`
`__hook_apply_rule_<:nnn`

If we see `->` we have to drop code for label #3 and carry on. We could do a little better and drop everything for that label since it doesn't matter where we put such empty code. However that would complicate the algorithm a lot with little gain.¹² So we still unnecessarily try to sort it in and depending on the rules that might result in a loop that is otherwise resolved. If that turns out to be a real issue, we can improve the code.

Here the code is removed from `\l__hook_cur_hook_tl` rather than #3 because the latter may be `??`, and the default hook doesn't store any code. Removing it instead from `\l__hook_cur_hook_tl` makes the default rules `->` and `<-` work properly.

```

1772 \cs_new_protected:cpn { __hook_apply_rule_->:nnn } #1#2#3
1773   {
1774     \_\_hook_debug:n

1879             }
1880     }

```

If there is code in the top-level token list, print it:

```

1880 \_\_hook\_log\_line:x
1881     {
1882         Document-level~(top-level)~code
1883         \_\_hook\_if\_usable:nT {#1}
1884             { ~(executed~\_\_hook\_if\_reversed:nTF {#1} {first} {last} ) } :
1885         }
1886 \_\_hook\_log\_line_indent:x
1887     {
1888         \_\_hook\_cs\_if\_empty:cTF { \_\_hook\_toplevel~#1 }
1889             { --- }
1890             { -> ~ \cs_replacement_spec:c { \_\_hook\_toplevel~#1 } }
1891     }
1892 \_\_hook\_log\_line:x { Extra~code~for~next~invocation: }
1893 \_\_hook\_log\_line_indent:x
1894     {
1895         \_\_hook\_cs\_if\_empty:cTF { \_\_hook\_next~#1 }
1896             { --- }

```

If the token list is not empty we want to display it but without the first tokens (the code to clear itself) so we call a helper command to get rid of them.

```

1897   {
1898     -> ~ \exp_last_unbraced:Nf \__hook_log_next_code:w
1899     { \cs_replacement_spec:c { _hook_next~#1 } }
1900   }
1901 }
```

Loop through the rules in a hook and for every rule found, print it. If no rule is there, print ---. The boolean `\l__hook_tmpa_bool` here indicates if the hook has no rules.

```

1902   \__hook_log_line:x { Rules: }

2073     }
2074 }
```

(End of definition for \hook_show:n and others. These functions are documented on page 214.)

__hook_list_rules:nn
__hook_list_one_rule:nnn
__hook_list_if_rule_exists:nnnF

This macro takes a 〈hook〉 and an 〈inline function〉 and loops through each pair of 〈labels〉 in the 〈hook〉, and if there is a relation between this pair of 〈labels〉, the 〈inline function〉 is executed with #1 = 〈relation〉, #2 = 〈label₁〉|〈label₂〉, and #3 = 〈hook〉 (the latter may be the argument #1 to __hook_list_rules:nn, or ?? if it is a default rule).

```
2075 \cs_new_protected:Npn \_\_hook_list_rules:nn #1 #2
2076 {
2077     \prop_if_exist:cT { g_\_\_hook_#1_code_prop }
2078     {
2079         \cs_set_protected:Npn \_\_hook_tmp:w ##1 ##2 ##3 {#2}
2080         \prop_map_inline:cn { g_\_\_hook_#1_code_prop }
2081         {
2082             \prop_map_inline:cn { g_\_\_hook_#1_code_prop }
2083             {
2084                 \_\_hook_if_label_case:nnnnn {##1} {####1}
2085                 { \prop_map_break: }
2086                 { \_\_hook_list_one_rule:nnn {##1} {####1} }
2087                 { \_\_hook_list_one_rule:nnn {####1} {##1} }
2088                 {#1}
2089             }
2090         }
2091     }
2092 }
```

These two are quite similar to `__hook_apply_label_pair:nnn` and `__hook_label_if_exist_apply:nnnF`, respectively, but rather than applying the rule, they pass it to the *(inline function)*.

```

2093 \cs_new_protected:Npn \_\_hook_list_one_rule:nnn #1#2#3
2094 {
2095     \_\_hook_list_if_rule_exists:nnnF {#1} {#2} {#3}
2096     { \_\_hook_list_if_rule_exists:nnnF {#1} {#2} { ?? } { } }

`__hook_gput_next_do:nn` Start by sanity-checking with `__hook_chk_args_allowed:nn`. Then check if the “next code” token list is empty: if so we need to add a `\tl_gclear:c` to clear it, so the code lasts for one usage only. The token list is cleared early so that nested usages don’t get lost. `\tl_gclear:c` is used instead of `\tl_gclear:N` in case the hook is used in an expansion-only context, so the token list doesn’t expand before `\tl_gclear:N`: that would make

an infinite loop. Also in case the main code token list is empty, the hook code has to be updated to add the next execution token list.

```

4.9 Using the hook

\hook_use:n \hook_use:n as defined here is used in the preamble, where hooks aren't initialized by default. __hook_use_initialized:n is also defined, which is the non-\protected version for use within the document. Their definition is identical, except for the __hook_preamble_hook:n (which wouldn't hurt in the expandable version, but it would be an unnecessary extra expansion).

__hook_use_initialized:n holds the expandable definition while in the preamble. __hook_preamble_hook:n initializes the hook in the preamble, and is redefined to \use_none:n at \begin{document}.

Both versions do the same thing internally: they check that the hook exists as given, and if so they use it as quickly as possible.

At \begin{document}, all hooks are initialized, and any change in them causes an update, so \hook_use:n can be made expandable. This one is better not protected so that it can expand into nothing if containing no code. Also important in case of generic hooks that we do not generate a \relax as a side effect of checking for a csname. In contrast to the TeX low-level \csname ... \endcsname construct \tl_if_exist:c is careful to avoid this.

```

`__hook_use:wn` `__hook_use:wn` does a quick check to test if the current hook is a file hook: those need a special treatment. If it is not, the hook does not exist. If it is, then `__hook_try_file_hook:n` is called, and checks that the current hook is a file-specific hook using `__hook_if_file_hook:wTF`. If it's not, then it's a generic `file/` hook and is used if it exist.

If it is a file-specific hook, it passes through the same normalization as during declaration, and then it is used if defined. `__hook_if_usable_use:n` checks if the hook exist, and calls `__hook_preamble_hook:n` if so, then uses the hook.

`\hook_use_once:n`
`\hook_use_once:nnw`

For hooks that can and should be used only once we have a special use command that further inhibits the hook from getting more code added to it. This has the effect that any further code added to the hook is executed immediately rather than stored in the hook.

The code needs some gymnastics to prevent space trimming from the hook name, since `\hook_use:n` and `\hook_use_once:n` are documented to not trim spaces.

```

When a hook has arguments, the call to `__hook_use_initialized:n`, should be the very last thing to happen, otherwise the arguments grabbed will be wrong. So, to clean up after the hook we need to cheat a bit and sneak the cleanup code at the end of the hook, along with the next execution code.

```

(End of definition for `__hook_use_once:nn`.)

`__hook_use_once_set:n` `__hook_use_once_set:n` is used before the actual hook code is executed so that any usage of `\AddToHook` inside the hook causes the code to execute immediately. Setting `\g__hook_<hook>_reversed_tl` to `I` prevents further code from being added to the hook. `__hook_use_once_clear:n` then clears the hook so that any further call to `\hook_use:n` or `\hook_use_once:n` will expand to nothing.

(End of definition for \__hook_use_once_set:n and \__hook_use_once_clear:n.)

```

`__hook_if_execute_immediately_p:n`
`__hook_if_execute_immediately:nTF`

To check whether the code being added should be executed immediately (that is, if the hook is a one-time hook), we check if `\g__hook_<hook>_reversed_tl` is `I`. The gymnastics around `\if:w` is there to allow the `reversed` token list to be empty.

```

2430 \prg_new_conditional:Npnn \__hook_if_execute_immediately:n #1 { T, F, TF }
2431   {
2432     \exp_after:wN \__hook_use_none_delimit_by_s_mark:w
2433     \if:w I
2434       \if_cs_exist:w g__hook_#1_reversed_tl \cs_end:
2435         \cs:w g__hook_#1_reversed_tl \exp_after:wN \cs_end:
2436       \fi:
2437       X
2438     \s__hook_mark \prg_return_true:
2439   \else:
2440     \s__hook_mark \prg_return_false:
2441   \fi:
2442 }

(End of definition for \__hook_if_execute_immediately:nTF.)

```

4.10 Querying a hook

Simpler data types, like token lists, have three possible states; they can exist and be empty, exist and be non-empty, and they may not exist, in which case emptiness doesn't apply (though `\tl_if_empty:N` returns false in this case).

Hooks are a bit more complicated: they have several other states as discussed in 4.4.2. A hook may exist or not, and either way it may or may not be empty (even a hook that doesn't exist may be non-empty) or may be disabled.

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its “next” token list. The hook doesn't need to be declared to have code added to its code pool (it may happen that a package *A* defines a hook `foo`, but it's loaded after package *B*, which adds some code to that hook. In this case it is important that the code added by package *B* is remembered until package *A* is loaded).

All other states can only be queried with internal tests as the different states are irrelevant for package code.

```
\hook_if_empty_p:n Test if a hook is empty (that is, no code was added to that hook). A <hook> being empty means that all three of its \g_hook_<hook>_code_prop, its \__hook_toplevel_<hook> and its \__hook_next_<hook> are empty.

2478 \prg_return_true:
2479 \EndIncludeInRelease
```

(End of definition for \hook_if_empty:nTF. This function is documented on page 214.)

__hook_if_usable_p:n A hook is usable if the token list that stores the sorted code for that hook, __hook_<hook>, exists. The property list \g_hook_<hook>_code_prop cannot be used here because often it is necessary to add code to a hook without knowing if such hook was already declared, or even if it will ever be (for example, in case the package that defines it isn't loaded).

```
2479 \prg_new_conditional:Npnn \__hook_if_usable:n #1 { p , T , F , TF }
2480 {
2481     \cs_if_exist:cTF { __hook~#1 }
```

```

2482     { \prg_return_true: }
2483     { \prg_return_false: }
2484 }
```

(End of definition for `_hook_if_usable:nTF`.)

`_hook_if_structure_exist:p:nTF`
`_hook_if_structure_exist:nTF`

An internal check if the hook has already its basic internal structure set up with `_hook_init_structure:n`. This means that the hook was already used somehow (a code chunk or rule was added to it), but it still wasn't declared with `\hook_new:n`.

```

2485 \prg_new_conditional:Npnn \_hook_if_structure_exist:n #1 { p , T , F , TF }
2486 {
2487     \prop_if_exist:cTF { g__hook_#1_code_prop }
2488     { \prg_return_true: }
2489     { \prg_return_false: }
2490 }
```

(End of definition for `_hook_if_structure_exist:nTF`.)

`_hook_if_declared:p:nTF`

Internal test to check if the hook was officially declared with `\hook_new:n` or a variant.

```

2491 \prg_new_conditional:Npnn \_hook_if_declared:n #1 { p , T , F , TF }
2492 {
2493     \tl_if_exist:cTF { g__hook_#1_declared_tl }
2494     { \prg_return_true: }
2495     { \prg_return_false: }
2496 }
```

(End of definition for `_hook_if_declared:nTF`.)

`_hook_if_reversed:p:nTF`

An internal conditional that checks if a hook is reversed.

```

2497 \prg_new_conditional:Npnn \_hook_if_reversed:n #1 { p , T , F , TF }
2498 {
2499     \exp_after:wN \_hook_use_none_delimit_by_s_mark:w
2500     \if:w - \cs:w g__hook_#1_reversed_tl \cs_end:
2501         \s__hook_mark \prg_return_true:
2502     \else:
2503         \s__hook_mark \prg_return_false:
2504     \fi:
2505 }
```

(End of definition for `_hook_if_reversed:nTF`.)

`_hook_if_generic:p:nTF`

An internal conditional that checks if a name belongs to a generic hook. The deprecated version needs to check if #3 is empty to avoid returning true on `file/before`, for example.

```

2506 \prg_new_conditional:Npnn \_hook_if_generic:n #1 { T , TF }
2507     { \_hook_if_generic:w #1 / / \s__hook_mark }
2508 \cs_new:Npn \_hook_if_generic:w #1 / #2 / #3 / #4 \s__hook_mark
2509 {
2510     \cs_if_exist:cTF { c__hook_generic_#/.#3_t1 }

2782 <tex>\ProvideDocumentCommand  
2783 <tex>\cs_new_protected:Npn \AddToHookNextWithArguments #1 #2 {}  
2784 <tex>\EndIncludeInRelease
```

(End of definition for \AddToHookNext and \AddToHookNextWithArguments . These functions are documented on page 204.)

\ClearHookNext

```
2785 \NewDocumentCommand \ClearHookNext { m }
2786   { \hook_gclear_next_code:n {#1} }
```

(End of definition for \ClearHookNext. This function is documented on page 204.)

\RemoveFromHook

```
2787 \NewDocumentCommand \RemoveFromHook { m o }
2788   { \hook_gremove_code:nn {#1} {#2} }
```

(End of definition for \RemoveFromHook. This function is documented on page 203.)

\SetDefaultHookLabel
\PushDefaultHookLabel
\PopDefaultHookLabel

Now define a wrapper that replaces the top of the stack with the argument, and updates \g__hook_hook_curr_name_tl accordingly.

```
2789 \NewDocumentCommand \SetDefaultHookLabel { m }
2790   { \__hook_set_default_hook_label:n {#1} }
```

The label is only automatically updated with \currenfilewithoptions (\usepackage and \documentclass), but some packages, like TikZ, define package-like interfaces, like \usetikzlibrary that are wrappers around \input, so they inherit the default label currently in force (usually top-level, but it may change if loaded in another package). To provide a package-like behavior also for hooks in these files, we provide high-level access to the default label stack.

```
2791 \NewDocumentCommand \PushDefaultHookLabel { m }
2792   { \__hook_curr_name_push:n {#1} }
2793 \NewDocumentCommand \PopDefaultHookLabel { }
2794   { \__hook_curr_name_pop: }
```

The current label stack holds the labels for all files but the current one (more or less like \currnamestack), and the current label token list, \g__hook_hook_curr_name_tl, holds the label for the current file. However \pushfilename happens before \currname is set, so we need to look ahead to get the \currname for the label. expl3 also requires the current file in \pushfilename, so here we abuse \expl@push@filename@aux@@ to do __hook_curr_name_push:n.

```
2795 \cs_gset_protected:Npn \expl@push@filename@aux@@ #1#2#3
2796   {
2797     \__hook_curr_name_push:n {#3}
2798     \str_gset:Nx \g_file_curr_name_str {#3}
2799     #1 #2 {#3}
2800   }
```

(End of definition for \SetDefaultHookLabel, \PushDefaultHookLabel, and \PopDefaultHookLabel. These functions are documented on page 207.)

\UseHook
\UseOneTimeHook

Avoid the overhead of xparse and its protection that we don't want here (since the hook should vanish without trace if empty)!

```
2801 <latexrelease>\IncludeInRelease{2023/06/01}{\UseHookWithArguments}
2802 <latexrelease>                                {Hooks-with-args}
2803 \cs_new:Npn \UseHook          { \hook_use:n }
2804 \cs_new:Npn \UseOneTimeHook { \hook_use_once:n }
2805 \cs_new:Npn \UseHookWithArguments      { \hook_use:nnw }
2806 \cs_new:Npn \UseOneTimeHookWithArguments { \hook_use_once:nnw }
2807 <latexrelease>\EndIncludeInRelease
2808 <latexrelease>\IncludeInRelease{2020/10/01}{\UseHookWithArguments}
```

```

2809  ⟨latexrelease⟩           {Hooks~with~args}
2810  ⟨latexrelease⟩\cs_new:Npn \UseHookWithArguments #1 #2 { }
2811  ⟨latexrelease⟩\cs_new:Npn \UseOneTimeHookWithArguments #1 #2 { }
2812  ⟨latexrelease⟩\EndIncludeInRelease

```

(End of definition for `\UseHook` and others. These functions are documented on page 201.)

`\ShowHook`

```

2813  \cs_new_protected:Npn \ShowHook { \hook_show:n }
2814  \cs_new_protected:Npn \LogHook { \hook_log:n }

```

(End of definition for `\ShowHook` and `\LogHook`. These functions are documented on page 210.)

`\DebugHooksOn`

```

2815  \cs_new_protected:Npn \DebugHooksOn { \hook_debug_on: }
2816  \cs_new_protected:Npn \DebugHooksOff { \hook_debug_off: }

```

(End of definition for `\DebugHooksOn` and `\DebugHooksOff`. These functions are documented on page 211.)

`\DeclareHookRule`

```

2817  \NewDocumentCommand \DeclareHookRule { m m m m }
2818    { \hook_gset_rule:nnnn {#1}{#2}{#3}{#4} }

```

(End of definition for `\DeclareHookRule`. This function is documented on page 208.)

`\DeclareDefaultHookRule`

This declaration is only supported before `\begin{document}`.

```

2819  \NewDocumentCommand \DeclareDefaultHookRule { m m m }
2820    { \hook_gset_rule:nnnn {??}{#1}{#2}{#3} }
2821  \onlypreamble\DeclareDefaultHookRule

```

(End of definition for `\DeclareDefaultHookRule`. This function is documented on page 209.)

`\ClearHookRule`

A special setup rule that removes an existing relation. Basically `_hook_rule_-gclear:nnn` plus fixing the property list for debugging.

FMi: Needs perhaps an L3 interface, or maybe it should get dropped?

```

2822  \NewDocumentCommand \ClearHookRule { m m m }
2823  { \hook_gset_rule:nnnn {#1}{#2}{unrelated}{#3} }

```

(End of definition for `\ClearHookRule`. This function is documented on page 208.)

`\IfHookEmptyTF` `\IfHookEmptyT` `\IfHookEmptyF`

Here we avoid the overhead of `xparse`, since `\IfHookEmptyTF` is used in `\end` (that is, every `LATEX` environment). As a further optimization, use `\let` rather than `\def` to avoid one expansion step.

```

2824  \cs_new_eq:NN \IfHookEmptyTF \hook_if_empty:nTF
2825  \cs_new_eq:NN \IfHookEmptyT \hook_if_empty:nT
2826  \cs_new_eq:NN \IfHookEmptyF \hook_if_empty:nF

```

(End of definition for `\IfHookEmptyTF`, `\IfHookEmptyT`, and `\IfHookEmptyF`. These functions are documented on page 210.)

`\IfHookExistsTF`

Marked for removal and no longer documented in the doc section!

PhO: `\IfHookExistsTF` is used in `jlreq.cls`, `pxatbegshi.sty`, `pxeverysel.sty`, `pxeveryshi.sty`, so the public name may be an alias of the internal conditional for a while. Regardless, those packages' use for `\IfHookExistsTF` is not really correct and can be changed.

```

2827  \cs_new_eq:NN \IfHookExistsTF \__hook_if_usable:nTF

```

(End of definition for `\IfHookExistsTF`.)

4.13 Deprecated that needs cleanup at some point

File 09

ltcmdhooks.dtx

1 Introduction

This file implements generic hooks for (arbitrary) commands. In theory every command `\langle name \rangle` offers now two associated hooks to which code can be added using `\AddToHook`,¹³ `\AddToHookNext`, `\AddToHookWithArguments`, and `\AddToHookNextWithArguments`.¹⁴

However, this is only true “in theory”. In practice there are a number of restrictions that makes it impossible to use such generic command hooks in a number of cases, so please read all of section 2 to understand what may prevent you from using them successfully.

The generic command hooks are:

`cmd/\langle name \rangle/before` This hook is executed at the very start of the command, right after its arguments (if any) are parsed. The hook `\langle code \rangle` runs in the command inside a call to `\UseHookWithArguments`. Any code added to this hook using `\AddToHookWithArguments` or `\AddToHookNextWithArguments` can access the command’s arguments using #1, #2, etc., up to the number of arguments of the command. If `\AddToHook` or `\AddToHookNext` are used, the arguments cannot be accessed (see the `lthooks` documentation¹⁵ on hooks with arguments).

`cmd/\langle name \rangle/after` This hook is similar to `cmd/\langle name \rangle/before`, but it is executed at the very end of the command body. This hook is implemented as a reversed hook.

The hooks are not physically present before `\begin{document}`¹⁶ (i.e., using a command in the preamble will never execute the hook) and if nobody has declared any code for them, then they are not added to the command code ever. For example, if we have the following definition

```
\newcommand\foo[2]{Code #1 for #2!}
```

then executing `\foo{A}{B}` will simply run `Code_A_for_B!` as it was always the case. However, if somebody, somewhere (e.g., in a package) adds

```
\AddToHook{cmd/foo/before}{<before code>}
```

then, after `\begin{document}` the definition of `\foo` will be:

```
\renewcommand\foo[2]{%
  \UseHookWithArguments{cmd/foo/before}{2}{#1}{#2}%
  Code #1 for #2!}
```

and similarly `\AddToHook{cmd/foo/after}{<after code>}` alters the definition to

¹³In this documentation, when something is being said about `\AddToHook`, the same will be valid for `\AddToHookWithArguments`, unless that particular paragraph is highlighting the differences between both. The same is true for the other hook-related functions and their ...`WithArguments` counterparts.

¹⁴In practice this is not supported for all types of commands, see section 2.2 for the restrictions that apply and what happens if one tries to use this with commands for which this is not supported.

¹⁵`texdoc lthooks-doc`

¹⁶More specifically, they are inserted in the commands after the `begindocument` hook, so they are also not present while L^AT_EX is reading the `.aux` file.

```
\renewcommand\foo[2]{%
  Code #1 for #2!%
  \UseHookWithArguments{cmd/foo/after}{2}{#1}{#2}}
```

In other words, the mechanism is similar to what `etoolbox` offers with `\pretocmd` and `\apptocmd` with the important differences

- that code can be prepended or appended (i.e., added to the hooks) even if the command itself is not (yet) defined, because the defining package has not been loaded at this point;
- and that by using the hook management interface it is now possible to define how the code chunks added in these places are ordered, if different packages want to add code at these points.

2 Restrictions and Operational details

Adding arbitrary material to commands is tricky because most of the time we do not know what the macro expects as arguments when expanding and `TeX` doesn't have a reliable way to see that, so some guesswork has to be employed.

We can do this in most cases when commands are defined using `\NewDocumentCommand` or `\newcommand` (with a few exceptions). For commands defined with `\def` the situation is less good. Common cases where the command hooks will not work are:

- Commands that use special catcode settings within their definition. In that case it is usually not possible to augment the definition (see [2.1](#)).
- If a command is defined while `\ExplSyntaxOn` is in force **and** the command contains `\~` characters to represent spaces, then it can't be patched to include the command hooks. In fact in some very special circumstances you might even get a low-level error rather than the information that the command can't be patched (see, for example, <https://github.com/latex3/latex2e/issues/1430>).
- Commands that have arguments as far as the user is concerned (e.g., `\section` or `\caption`), but are defined in a way that these arguments are not read by the user level command but only later during the processing. In that case the `after` hook doesn't work at all. The before hook only works with `\AddToHook` but not with `\AddToHookWithArguments` because the arguments haven't been read at that point where the hook is patched in. See section [2.2](#).
- Adding a specific generic command hook is only attempted once per command, thus after redefining a command such hooks will no longer be there and will also not be re-added, see section [2.1.1](#).

All this means that you have to have a good understanding of how commands are defined when you attempt to make use of such hooks and something goes wrong. What can help in that case is to turn on `\DebugHooksOn` in which case you get much more (low-level) details on why something fails and what was tried to enable the hooks.

2.1 Patching

The code here tries to find out if a command was defined with `\newcommand` or `\DeclareRobustCommand` or `\NewDocumentCommand`, and if so it *assumes* that the argument specification of the command is as expected (which is not fail-proof, if someone redefines the internals of these commands in devious ways, but is a reasonable assumption).

If the command is one of the defined types, the code here does a sandboxed expansion of the command such that it can be redefined again exactly as before, but with the hook code added.

If however the command is not a known type (it was defined with `\def`, for example), then the code uses an approach similar to `etoolbox`'s `\patchcmd` to retokenize the command with the hook code in place. This procedure, however, is more likely to fail if the catcode settings are not the same as the ones at the time of command's definition, so not always adding a hook to a command will work.

2.1.1 Timing

When `\AddToHook` (or its `expl3` equivalent) is called with a generic `cmd` hook, say, `cmd/foo/before`, for the first time (that is, no code was added to that same hook before), in the preamble of a document, it will store a patch instruction for that command until `\begin{document}`, and only then all the commands which had hooks added will be patched in one go. That means that no command in the preamble will have hooks patched into them.

At `\begin{document}` all the delayed patches will be executed, and if the command doesn't exist the code is still added to the hook, but it will not be executed. After `\begin{document}`, when `\AddToHook` is called with a generic `cmd` hook the first time, the command will be immediately patched to include the hook, and if it doesn't exist or if it can't be patched for any reason, an error is thrown; if `\AddToHook` was already used in the preamble no new patching is attempted.

This has the consequence that a command defined or redefined after `\begin{document}` only uses generic `cmd` hook code if `\AddToHook` is called for the first time after the definition is made, or if the command explicitly uses the generic hook in its definition by declaring it with `\NewHookPair` adding `\UseHook` as part of the code.¹⁷

2.2 Commands that look ahead

Some commands are defined in different “steps” and they look ahead in the input stream to find more arguments. If you try to add some code to the `cmd/<name>/after` hook of such command, it will not work, and it is not possible to detect that programmatically, so the user has to know (or find out) which commands can or cannot have hooks attached to them.

One good example is the `\section` command. You can add something to the `cmd/section/before` hook (but only with `\AddToHook` not `\AddToHookWithArguments`), but if you try to add anything to the `cmd/section/after` hook, `\section` will no longer work at all. That happens because the `\section` macro takes no argument, but instead calls a few internal L^AT_EX macros to look for the optional and mandatory arguments. By adding code to the `cmd/section/after` hook, you get in the way of that scanning.

¹⁷We might change this behavior in the main document slightly after gaining some usage experience.

In such a case, where it is known that a specific generic command hook does not work if code is added to it, the package author can add a `\DisableGenericHook`¹⁸ declaration to prevent this from happening in user documents and thereby avoiding obscure errors.

3 Package Author Interface

The `cmd` hooks are, by default, available for all commands that can be patched to add the hooks. For some commands, however, the very beginning or the very end of the code is not the best place to put the hooks, for example, if the command looks ahead for arguments (see section 2.2).

If you are a package author and you want to add the hooks to your own commands in the proper position you can define the command and manually add the `\UseHookWithArguments` calls inside the command in the proper positions, and manually define the hooks with `\NewHookWithArguments` or `\NewReversedHookWithArguments`. When the hooks are explicitly defined, patching is not attempted so you can make sure your command works properly. For example, an (admittedly not really useful) command that typesets its contents in a framed box with width optionally given in parentheses:

```
\newcommand\fancybox{\@ifnextchar({\@fancybox}{\@fancybox(5cm)}}
\def\@fancybox(#1)#2{\fbox{\parbox{#1}{#2}}}
```

If you try that definition, then add some code after it with

```
\AddToHook{cmd/fancybox/after}{<code>}
```

and then use the `\fancybox` command you will see that it will be completely broken, because the hook will get executed in the middle of parsing for optional (...) argument.

If, on the other hand, you want to add hooks to your command you can do something like:

```
\newcommand\fancybox{\@ifnextchar({\@fancybox}{\@fancybox(5cm)}}
\def\@fancybox(#1)#2{\fbox{%
    \UseHookWithArguments{cmd/fancybox/before}{2}{#1}{#2}%
    \parbox{#1}{#2}%
    \UseHookWithArguments{cmd/fancybox/after}{2}{#1}{#2}}}
\NewHookWithArguments{cmd/fancybox/before}{2}
\NewReversedHookWithArguments{cmd/fancybox/after}{2}
```

then the hooks will be executed where they should and no patching will be attempted. It is important that the hooks are declared with `\NewHookWithArguments` or `\NewReversedHookWithArguments`, otherwise the command hook code will try to patch the command. Note also that the call to `\UseHookWithArguments{cmd/fancybox/before}` does not need to be in the definition of `\fancybox`, but anywhere it makes sense to insert it (in this case in the internal `\@fancybox`).

Alternatively, if for whatever reason your command does not support the generic hooks provided here, you can disable a hook with `\DisableGenericHook`¹⁹, so that when someone tries to add code to it they will get an error. Or if you don't want the error, you can simply declare the hook with `\NewHook` and never use it.

¹⁸Please use `\DisableGenericHook` if at all, only on hooks that you “own”, i.e., for commands your package or class defines and not second guess whether or not hooks of other packages should get disabled!

¹⁹Please use `\DisableGenericHook` if at all, only on hooks that you “own”, i.e., for commands your package or class defines and not second guess whether or not hooks of other packages should get disabled!

The above approach is useful for really complex commands where for one or the other reason the hooks can't be placed at the very beginning and end of the command body and some hand-crafting is needed. However, in the example above the real (and in fact only) issue is the cascading argument parsing in the style developed long ago in L^AT_EX 2.09. Thus, a much simpler solution for this case is to replace it with the modern `\NewDocumentCommand` syntax and define the command as follows:

```
\DeclareDocumentCommand\fancybox{D(){5cm}m}{\fbox{\parbox{#1}{#2}}}
```

If you do that then both hooks automatically work and are patched into the right places.

3.1 Arguments and redefining commands

The code in `ltcmdhooks` does its best to find out how many arguments a given command has, and to insert the appropriate call to `\UseHookWithArguments`, so that the arguments seen by the hook are exactly those grabbed by the command (the hook, after all, is a macro call, so the arguments have to be placed in the right order, or they won't match).

When using the package writer interface, as discussed in section 3, to change the position of the hooks in your commands, you are also free to change how the hook code in your command sees its arguments. When a `cmd` hook is declared with `\NewHook` (or `\NewHookWithArguments` or other variations of that), it loses its "generic" nature and works as a regular hook. This means that you may choose to declare it without arguments regardless if the command takes arguments or not, or declare it with arguments, even if the command takes none.

However, this flexibility should not be abused. When using a nonstandard configuration for the hook arguments, think reasonably: a user will expect that the argument `#1` in the hook corresponds to the argument's first argument, and so on. Any other configuration is likely to cause confusion and, if used, will have to be well documented.

This flexibility, however, allows you to "correct" the arguments for the hooks. For example, L^AT_EX's `\refstepcounter` has a single argument, the name of the counter. The `cleveref` package adds an optional argument to `\refstepcounter`, making the name of the counter argument `#2`. If the author of `cleveref` wanted, for whatever reason, to add hooks to `\refstepcounter`, to preserve compatibility he could write something along the lines of:

```
\NewHookWithArguments{cmd/refstepcounter/before}{1}
\renewcommand\refstepcounter[2] [〈default〉]{%
  \UseHookWithArguments{cmd/refstepcounter/before}{1}{#2}%
  <code for \refstepcounter>}
```

so that the mandatory argument, which is arg `#2` in the definition, would still be seen as `#1` in the hook code.

Another possibility would be to place the optional argument as the second argument for the hook, so that people looking for it would be able to use it. In either case, it would have to be well documented to cause as little confusion as possible.

4 The Implementation

4.1 Execution plan

To add `before` and `after` hooks to a command we will need to peek into the definition of a command, which is always a tricky thing to do. Some cases are easy because we

know how the command was defined, so we can assume how its `\parameter` looks like (for example a command defined with `\newcommand` may have an optional argument followed by a run of mandatory arguments), so we can just expand that command and make it grab #1, #2, etc. as arguments and define it all back with the hooks added.

Life's usually not that easy, so with some commands we can't do that (a #1 might as well be `#1212` instead of the expected `#612`, for example) so we need to resort to "patching" the command: read its `\meaning`, and tokenize it again with `\scantokens` and hope for the best.

So the overall plan is:

1. Check if a command is of a known type (that is, defined with `\newcommand`²⁰, `\DeclareRobustCommand`, or `\New(Expandable)DocumentCommand`), and if is, take appropriate action.
2. If the command is not a known type, we'll check if the command can be patched. Two things will prevent a command from being patched: if it was defined in a nonstandard catcode setting, or if it is an internal expl3 command with `_⟨module⟩` in its name, in which case we refuse to patch.
3. If the command was defined in nonstandard catcode settings, we will try a few standard ones to try our best to carry out the patching. If this doesn't help either, the code will give up and throw an error.

```

1  ⟨@=hook⟩
2  ⟨*2ekernel | latexrelease⟩
3  \ExplSyntaxOn
4  ⟨latexrelease⟩ \NewModuleRelease{2021/06/01}{ltcmdhooks}
5  ⟨latexrelease⟩           {The~hook~management~system~for~commands}

```

4.2 Variables

Pairs of `\if<cmd>.. \patch<cmd>` to be used with `\robust@command@act` when looking for a known patching rule. This token list is exposed because we see some future applications (with very specialized packages, such as `etoolbox` that may want to extend the pairs processed. It is not meant for general use which is why it is not documented in the interface documentation above.

```
6  \tl_new:N \g_hook_patch_action_list_tl
```

(End of definition for `\g_hook_patch_action_list_tl`.)

`\l_hook_patch_num_args_int` The number of arguments in a macro being patched.

```
7  \int_new:N \l_hook_patch_num_args_int
```

(End of definition for `\l_hook_patch_num_args_int`.)

`\l_hook_patch_prefixes_tl` The prefixes and parameters of the definition for the macro being patched.

```

8  \tl_new:N \l_hook_patch_prefixes_tl
9  \tl_new:N \l_hook_param_text_tl
10 \tl_new:N \l_hook_replace_text_tl
```

²⁰It's not always possible to reliably detect this case because a command defined with no optional argument is indistinguishable from a `\def` command.

	(End of definition for \l_hook_patch_prefixes_t1, \l_hook_param_text_t1, and \l_hook_replace_text_t1.)
\c_hook_hash_t1	Two constant token lists that contain one and two parameter tokens.
\c_hook_hashes_t1	<pre> 11 \tl_const:Nn \c_hook_hash_t1 { # } 12 \tl_const:Nn \c_hook_hashes_t1 { # # }</pre>
	(End of definition for \c_hook_hash_t1 and \c_hook_hashes_t1.)
_hook_exp_not:NN	Two temporary macros that change depending on the macro being patched.
_hook_def_cmd:w	<pre> 13 \cs_new_eq:NN _hook_exp_not:NN ? 14 \cs_new_eq:NN _hook_def_cmd:w ?</pre>
	(End of definition for _hook_exp_not:NN and _hook_def_cmd:w.)
\q_hook_recursion_tail	Internal quarks for recursion: they can't appear in any macro being patched.
\q_hook_recursion_stop	<pre> 15 \quark_new:N \q_hook_recursion_tail 16 \quark_new:N \q_hook_recursion_stop</pre>
	(End of definition for \q_hook_recursion_tail and \q_hook_recursion_stop.)
\g_hook_delayed_patches_prop	A list containing the patches delayed to \begin{document}, so that patching is not attempted twice.
	<pre> 17 \prop_new:N \g_hook_delayed_patches_prop</pre>
	(End of definition for \g_hook_delayed_patches_prop.)
_hook_patch_debug:x	A helper for patching debug info.
	<pre> 18 \cs_new_protected:Npn _hook_patch_debug:x #1 19 { _hook_debug:n { \iow_term:x { [lthooks]~#1 } } }</pre>
	(End of definition for _hook_patch_debug:x.)

4.3 Variants

\tl_rescan:nV	expl3 function variants used throughout the code.
	<pre> 20 \cs_generate_variant:Nn \tl_rescan:nn { nV }</pre>
	(End of definition for \tl_rescan:nV.)

4.4 Patching or delaying

Before \begin{document} all patching is delayed.

_hook_try_put_cmd_hook:n _hook_try_put_cmd_hook:w	This function is called from within \AddToHook, when code is first added to a generic cmd hook. If it is called within the preamble, it delays the action until \begin{document}; otherwise it tries to update the hook.
	<pre> 21 ⟨latexrelease⟩\IncludeInRelease{2024/12/22}{_hook_try_put_cmd_hook:n}% 22 ⟨latexrelease⟩ {Don't~define~command} 23 \cs_new_protected:Npn _hook_try_put_cmd_hook:n #1 24 { _hook_try_put_cmd_hook:w #1 / / \s_hook_mark {#1} } 25 \cs_new_protected:Npn _hook_try_put_cmd_hook:w 26 #1 / #2 / #3 / #4 \s_hook_mark #5 27 { 28 _hook_debug:n { \iow_term:n { ->~Adding~cmd~hook~to~'#2'~'~(#3): } }</pre>

__hook_patch_cmd_or_delay:Nnn expects the command to be patched as its first argument so we need to construct it from its name (#2). However, at this moment it may not exist yet, so using \cs:w would incorrectly turn it from “undefined” into \relax. We therefore use the following curious construction: we start a group and expand out of it to call \cs:w. If the command is now changed to \relax the \group_end: will undo that change, but the token is nevertheless there to be consumed by __hook_patch_cmd_or_delay:Nnn.

```

29      \group_begin:
30          \exp_after:wN
31      \group_end:
32          \exp_after:wN
33      \_\_hook_patch_cmd_or_delay:Nnn
34          \cs:w #2\cs_end:
35          {#2} {#3}
36      }
37  \end{IncludeInRelease}
38 \IncludeInRelease{2021/11/15}{\_\_hook_try_put_cmd_hook:n}%
39 \Standardise-generic-hook-names
40 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:n #1
41 { \_\_hook_try_put_cmd_hook:w #1 // \s__hook_mark {#1} }
42 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:w
43 { #1 / #2 / #3 / #4 \s__hook_mark #5
44 \{
45 \_\_hook_debug:n { \iow_term:n { ->~Adding~cmd~hook~to~'#2'~(#3): } }
46 \exp_args:Nc \_\_hook_patch_cmd_or_delay:Nnn {#2} {#2} {#3}
47 \}
48 \end{IncludeInRelease}
49 \IncludeInRelease{2021/06/01}{\_\_hook_try_put_cmd_hook:n}%
50 \Standardise-generic-hook-names
51 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:n #1
52 { \_\_hook_try_put_cmd_hook:w #1 // \s__hook_mark {#1} }
53 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:w
54 { #1 / #2 / #3 / #4 \s__hook_mark #5
55 \{
56 \_\_hook_debug:n { \iow_term:n { ->~Adding~cmd~hook~to~'#2'~(#3): } }
57 \str_case:nnTF {#3}
58 { { before } { } { after } { } }
59 { \exp_args:Nc \_\_hook_patch_cmd_or_delay:Nnn {#2} {#2} {#3} }
60 { \msg_error:nnnn { hooks } { wrong-cmd-hook } {#2} {#3} }
61 \}
62 \end{IncludeInRelease}

```

(End of definition for __hook_try_put_cmd_hook:n and __hook_try_put_cmd_hook:w.)

In the preamble, __hook_patch_cmd_or_delay:Nnn just adds the patch instruction to a property list to be executed later.

```

63 \cs_new_protected:Npn \_\_hook_patch_cmd_or_delay:Nnn #1 #2 #3
64 {
65     \_\_hook_debug:n { \iow_term:n { ->~Add-generic-cmd-hook-for~#2~(#3). } }
66     \_\_hook_debug:n
67     { \iow_term:n { !~In~the~preamble:~delaying. } }
68     \prop_gput:Nnn \g__hook_delayed_patches_prop { #2 / #3 }
69     { \_\_hook_cmd_try_patch:nn {#2} {#3} }

```

```
70 }
```

The delayed patches are added to a property list to prevent duplication, and the code stored in the property list for each key is executed. The function `__hook_patch_cmd_or_delay:Nnn` is also redefined to be `__hook_patch_command:Nnn` so that no further delaying is attempted.

```
71 \cs_new_protected:Npn \_\_hook_cmd_begindocument_code:
72 {
73     \cs_gset_eq:NN \_\_hook_patch_cmd_or_delay:Nnn \_\_hook_patch_command:Nnn
74     \prop_map_function:NN \g_\_\_hook_delayed_patches_prop { \use_i:nn }
75     \prop_gclear:N \g_\_\_hook_delayed_patches_prop
76     \cs_undefine:N \_\_hook_cmd_begindocument_code:
77 }
78 \g@addto@macro \g@kernel@after@begindocument
79 { \_\_hook_cmd_begindocument_code: }
```

(End of definition for `__hook_patch_cmd_or_delay:Nnn` and `__hook_cmd_begindocument_code:..`)

`__hook_cmd_try_patch:nn`

At `\begin{document}` tries patching the command if the hook was not manually created in the meantime. If the document does not exist, no error is raised here as it may hook into a package that wasn't loaded. Hooks added to commands in the document body still raise an error if the command is not defined.

```
80 \cs_new_protected:Npn \_\_hook_cmd_try_patch:nn #1 #2
81 {
82     \_\_hook_debug:n
83     { \iow_term:x { ->~\string\begin{document}~try-cmd / #1 / #2. } }
84     \_\_hook_if_declared:nTF { cmd / #1 / #2 }
85     {
86         \_\_hook_debug:n
87         { \iow_term:n { .->~Giving-up:~hook~already~created. } }
88     }
89     {
90         \cs_if_exist:cT {#1}
91         { \exp_args:Nc \_\_hook_patch_command:Nnn {#1} {#1} {#2} }
92     }
93 }
```

(End of definition for `__hook_cmd_try_patch:nn`.)

4.5 Patching commands

`__hook_patch_command:Nnn`
`__hook_patch_check:NNnn`
`__hook_if_public_command:NTF`
`__hook_if_public_command:w`

`__hook_patch_command:Nnn` will do some sanity checks on the argument to detect if it is possible to add hooks to the command, and raises an error otherwise. If the command can contain hooks, then it uses `\robust@command@act` to find out what type is the command, and patch it accordingly.

```
94 \cs_new_protected:Npn \_\_hook_patch_command:Nnn #1 #2 #3
95 {
96     \_\_hook_patch_debug:x { analyzing~'\token_to_str:N #1' }
97     \_\_hook_patch_debug:x { \token_to_str:N #1 = \token_to_meaning:N #1 }
98     \_\_hook_patch_check:NNnn \cs_if_exist:NTF #1 { undef }
99     {
100         \_\_hook_patch_debug:x { ++~control~sequence~is~defined }
101         \_\_hook_patch_check:NNnn \token_if_macro:NTF #1 { macro }
102     }
```

```

103         \_\_hook_patch_debug:x { +\~control\~sequence\~is\~a\~macro }
104         \_\_hook_patch_check:NNnn \_\_hook_if_public_command:NTF #1 { expl3 }
105         {
106             \_\_hook_patch_debug:x { +\~macro\~is\~not\~private }
107             \robust@command@act
108             \g_hook_patch_action_list_tl #1
109             \_\_hook_retokenize_patch:Nnn { #1 {#2} {#3} }
110         }
111     }
112 }
113 }
```

And here's the auxiliary used above:

```

114 \cs_new_protected:Npn \_\_hook_patch_check:NNnn #1 #2 #3 #4
115 {
116     #1 #2 {#4}
117     {
118         \msg_error:nnxx { hooks } { cant-patch }
119         { \token_to_str:N #2 } {#3}
120     }
121 }
```

and a conditional __hook_if_public_command:NTF to check if a command has __ in its name (no other checking is performed). Primitives with :D in their name could be included here, but they are already discarded in the \token_if_macro:NTF test above.

```

122 \use:x
123 {
124     \prg_new_protected_conditional:Npnn
125         \exp_not:N \_\_hook_if_public_command:N ##1 { TF }
126     {
127         \exp_not:N \exp_last_unbraced:Nf
128         \exp_not:N \_\_hook_if_public_command:w
129         { \exp_not:N \cs_to_str:N ##1 }
130         \tl_to_str:n { __ } \s__hook_mark
131     }
132 }
133 \exp_last_unbraced:NNNNo
134 \cs_new_protected:Npn \_\_hook_if_public_command:w
135     #1 \tl_to_str:n { __ } #2 \s__hook_mark
136 {
137     \tl_if_empty:nTF {#2}
138     { \prg_return_true: }
139     { \prg_return_false: }
140 }
```

(End of definition for __hook_patch_command:Nnn and others.)

4.5.1 Patching by expansion and redefinition

This is the list of known command types and the function that patches the command hooks into them. The conditionals are taken from \ShowCommand, \NewCommandCopy and __kernel_cmd_if_xparse:NTF defined in ltcmd.

```

141 \tl_gset:Nn \g_hook_patch_action_list_tl
142 {
143     { \c@if@DeclareRobustCommand \_\_hook_patch_DeclareRobustCommand:Nnn }
```

```

144     { \c@if@newcommand \_hook_patch_newcommand:Nnn }
145     { \_kernel_cmd_if_xparse:NTF \_hook_cmd_patch_xparse:Nnn }
146 }

```

(End of definition for `\g_hook_patch_action_list_t1`.)

`_hook_patch_DeclareRobustCommand:Nnn` At this point we know that the commands can be patched by expanding then redefining. These are the cases of commands defined with `\newcommand` with an optional argument or with `\DeclareRobustCommand`.

With `_hook_patch_DeclareRobustCommand:Nnn` we check if the command has an optional argument (with a test counter-intuitively called `\c@if@newcommand`; also make sure the command doesn't take args by calling `\robust@command@chk@safe`). If so, we pass the patching action to `_hook_patch_newcommand:Nnn`, otherwise we call the patching engine `_hook_patch_expand_redefine:NNnn \c_false_bool` to indicate that there is no optional argument.

```

147 \cs_new_protected:Npn \_hook_patch_DeclareRobustCommand:Nnn #1
148 {
149     \exp_args:Nc \_hook_patch_DeclareRobustCommand_aux:Nnn
150     { \cs_to_str:N #1 ~ }
151 }
152 \cs_new_protected:Npn \_hook_patch_DeclareRobustCommand_aux:Nnn #1
153 {
154     \robust@command@chk@safe #1
155     { \c@if@newcommand #1 }
156     { \use_i:nn }
157     { \_hook_patch_newcommand:Nnn }
158     { \_hook_patch_expand_redefine:NNnn \c_false_bool }
159     #1
160 }

```

(End of definition for `_hook_patch_DeclareRobustCommand:Nnn`.)

`_hook_patch_newcommand:Nnn` If the command was defined with `\newcommand` and an optional argument, call the patching engine with a `\c_true_bool` to flag the presence of an optional argument, and with `\backslash command` to patch the actual code for `\command`.

```

161 \cs_new_protected:Npn \_hook_patch_newcommand:Nnn #1
162 {
163     \exp_args:NNc \_hook_patch_expand_redefine:NNnn \c_true_bool
164     { \c_backslash_str \cs_to_str:N #1 }
165 }

```

(End of definition for `_hook_patch_newcommand:Nnn`.)

`_hook_cmd_patch_xparse:Nnn` And for commands defined by the `xparse` commands use this for patching:

```

166 \cs_new_protected:Npn \_hook_cmd_patch_xparse:Nnn #1
167 {
168     \exp_args:NNc \_hook_patch_expand_redefine:NNnn \c_false_bool
169     { \cs_to_str:N #1 ~ code }
170 }

```

(End of definition for `_hook_cmd_patch_xparse:Nnn`.)

```
\_\_hook\_patch\_expand\_redefine:Nnnn
\_\_hook\_redefine\_with\_hooks:Nnnn
\_\_hook\_make\_prefixes:w
```

Now the real action begins. Here we have in #1 a boolean indicating if the command has a leading [...] -delimited argument, in #2 the command control sequence, in #3 the name of the command (note that #1 ≠ \csname#2\endcsname at this point!), and in #4 the hook position, either `before` or `after`.

Patching with expansion+redefinition is trickier than it looks like at first glance. Suppose the simple definition:

```
\def\foo#1{#1##2}
```

When defined, its `<replacement text>` will be a token list containing:

```
out_param 1, mac_param #, character 2
```

Then, after expanding `\foo{##1}` (here ## denotes a single #₆) we end up with a token list with `out_param 1` replaced:

```
mac_param #, character 1, mac_param #, character 2
```

that is, the definition would be:

```
\def\foo#1{#1#2}
```

which obviously fails, because the original input in the definition was ## but TeX reduced that to a single parameter token #₆ when carrying out the definition. That leaves no room for a clever solution with (say) `\unexpanded`, because anything that would double the second #₆, would also (incorrectly) double the first, so there's not much to do other than a manual solution.

There are three cases we can distinguish to make things hopefully faster on simpler cases:

1. a macro with no parameters;
2. a macro with no parameter tokens in its definition;
3. a macro with parameters *and* parameter tokens.

The first case is trivial: if the macro has no parameters, we can just use `\unexpanded` around it, and if there is a parameter token in it, it is handled correctly (the macro can be treated as a `tl` variable).

The second case requires looking at the `<replacement text>` of the macro to see if it has a parameter token in there. If it does not, then there is no worry, and the macro can be redefined normally (without `\unexpanded`).

The third case, as usual, is the devious one. Here we'll have to loop through the definition token by token, and double every parameter token, so that this case can be handled like the previous one.

```
171 <|latexrelease>\IncludeInRelease{2023/06/01}{\_\_hook\_patch\_expand\_redefine:Nnnn}
172 <|latexrelease>                                {cmd~hooks~with~args}
173 \cs_new_protected:Npn \_\_hook_patch_expand_redefine:Nnnn #1 #2 #3 #4
174   {
175     \_\_hook_patch_debug:x { +--+command~can~be~patched~without~rescanning }
```

We'll start by counting the number of arguments in the command by counting the number of characters in the `\cs_parameter_spec:N` of the macro, divided by two, and subtracting one if the command has an optional argument (that is, an extra `[]` in its `<parameter text>`).

```

176      \int_set:Nn \l__hook_patch_num_args_int
177      {
178          \exp_args:Nf \str_count:n { \__kernel_cs_parameter_spec:N #2 } / 2
179          \bool_if:NT #1 { -1 }
180      }

```

Now build two token lists:

`\l__hook_param_text_tl` will contain the `<parameter text>` to be used when redefining the macro. It should be identical to the `<parameter text>` used when originally defining that macro.

`\l__hook_replace_text_tl` will contain braced pairs of `\c__hook_hashes_tl<num>` to feed to the macro when expanded. This token list as well as the previous will have the first item surrounded by `[...]` in the case of an optional argument.

The use of `\c__hook_hashes_tl` here is to differentiate actual parameters in the macro from parameter tokens in the original definition of the macro. Later on, `\c__hook_hashes_tl` is either replaced by actual parameter tokens, or expanded into them.

```

181      \int_compare:nNnTF { \l__hook_patch_num_args_int } > { \c_zero_int }
182      {

```

We'll first check if the command has any parameter token in its definition (feeding it empty arguments), and set `__hook_exp_not:n` accordingly. `__hook_exp_not:n` will be used later to either leave `\c__hook_hashes_tl` or expand it, and also to remember the result of `__hook_if_has_hash:nTF` to avoid testing twice (the test can be rather slow).

```

183      \tl_set:Nx \l__hook_tmpa_tl { \bool_if:NTF #1 { [ ] } { { } } }
184      \int_step_inline:nnn { 2 } { \l__hook_patch_num_args_int }
185          { \tl_put_right:Nn \l__hook_tmpa_tl { { } } }
186          \exp_args:NNo \exp_args:No \__hook_if_has_hash:nTF
187              { \exp_after:wN #2 \l__hook_tmpa_tl }
188              { \cs_set_eq:NN \__hook_exp_not:n \exp_not:n }
189              { \cs_set_eq:NN \__hook_exp_not:n \use:n }
190          \cs_set_protected:Npn \__hook_tmp:w ##1 ##2
191          {
192              ##1 \l__hook_param_text_tl { \use:n ##2 }
193              ##1 \l__hook_replace_text_tl { \__hook_exp_not:n {##2} }
194          }

```

Here we'll conditionally add `[...]` around the first parameter:

```

195      \bool_if:NTF #1
196          { \__hook_tmp:w \tl_set:Nx { [ \c__hook_hashes_tl 1 ] } }
197          { \__hook_tmp:w \tl_set:Nx { { \c__hook_hashes_tl 1 } } }

```

Then, for every parameter from the second, just add it normally:

```

198      \int_step_inline:nnn { 2 } { \l__hook_patch_num_args_int }
199          { \__hook_tmp:w \tl_put_right:Nx { { \c__hook_hashes_tl ##1 } } }

```

Now, if the command has any parameter token in its definition (then `__hook_exp_not:n` is `\exp_not:n`), call `__hook_double_hashes:n` to double them, and replace every `\c__hook_hashes_tl` by #:

```

200      \tl_set:Nx \l__hook_replace_text_tl
201          { \exp_not:N #2 \exp_not:V \l__hook_replace_text_tl }
202      \tl_set:Nx \l__hook_replace_text_tl
203          {
204              \token_if_eq_meaning:NNTF \__hook_exp_not:n \exp_not:n
205                  { \exp_args:NNV \exp_args:No \__hook_double_hashes:n }
206                  { \exp_args:NV \exp_not:o }
207                      \l__hook_replace_text_tl
208          }

```

And now, set a few auxiliaries for the case that the macro has parameters, so it won't be passed through `\unexpanded` (twice):

```

209      \cs_set_eq:NN \__hook_def_cmd:w \tex_gdef:D
210      \cs_set_eq:NN \__hook_exp_not:NN \prg_do_nothing:
211          }
212          {

```

In the case the macro has no parameters, we'll treat it as a token list and things are much simpler (expansion control looks a bit complicated, but it's just a pair of `\exp_not:N` preventing another `\exp_not:n` from expanding):

```

213          \tl_clear:N \l__hook_param_text_tl
214          \tl_set_eq:NN \l__hook_replace_text_tl #2
215          \cs_set_eq:NN \__hook_def_cmd:w \tex_xdef:D
216          \cs_set:Npn \__hook_exp_not:NN ##1 { \exp_not:N ##1 \exp_not:N }
217      }

```

Before redefining, we need to also get the prefixes used when defining the command. Here we ensure that the `\escapechar` is printable, otherwise a macro defined with prefixes `\protected \long` will have it `\meaning` printed as `protectedlong`, making life unnecessarily complicated. Here the `\escapechar` is changed to /, then we loop between pairs of /.../ extracting the prefixes.

```

218      \group_begin:
219          \int_set:Nn \tex_escapechar:D { '\/>
220          \use:x
221              {
222          \group_end:
223          \tl_set:Nx \exp_not:N \l__hook_patch_prefixes_tl
224              { \exp_not:N \__hook_make_prefixes:w \cs_prefix_spec:N #2 / / }
225      }

```

Here we redefine the hook to have the right number of arguments. Disabling the hook, undefining the `parameter` token list then calling `__hook_make_usable:nn` are enough to redefine the hook to the extent we want. Code stored in the hook and other metadata about it are not lost in the process.

```

226      \__hook_disable:n { cmd / #3 / #4 }
227      \cs_undefine:c { c__hook_cmd / #3 / #4_parameter_tl }
228      \__hook_make_usable:nn { cmd / #3 / #4 } { \l__hook_patch_num_args_int }

```

Now call `__hook_redefine_with_hooks:Nnnn` with the macro being redefined in #1, then `\UseHook{cmd/<name>/before}` in #2 or `\UseHook{cmd/<name>/after}` in #3 (one is always empty), and in #4 the `<replacement text>` of the macro.

```

229      \use:e
230      {
231          \__hook_redefine_with_hooks:Nnnn \exp_not:N #2
232          \str_if_eq:nnTF {#4} { after }
233              { \use_i:i:nn }
234              { \use:nn }
235              {
236                  \__hook_exp_not>NN \exp_not:N \UseHookWithArguments
237                      { cmd / #3 / #4 } { \int_use:N \l__hook_patch_num_args_int }
238                      \__hook_braced_parameter:n { cmd / #3 / #4 }
239              }
240              { { } }
241          { \__hook_exp_not>NN \exp_not:V \l__hook_replace_text_t1 }
242      }

```

Finally, update the hook code.

```

243      \__hook_update_hook_code:n { cmd / #3 / #4 }
244  }

311 <latexrelease>       }
312 <latexrelease> \EndIncludeInRelease

```

Now that all the needed tools are ready, without further ado we'll redefine the command. The definition uses the prefixes gathered in `\l__hook_patch_prefixes_tl`, a primitive `__hook_def_cmd:w` (which is `\tex_gdef:D` or `\tex_xdef:D`) to avoid adding extra prefixes, and the `<parameter text>` from `\l__hook_param_text_tl`.

Then finally, in the body of the definition, we insert #2, which is `cmd/#1/before` or empty, #4 which is the `<replacement text>`, and #3 which is `cmd/#1/after` or empty.

```

313 \cs_new_protected:Npn \__hook_redefine_with_hooks:Nnnn #1 #2 #3 #4
314   {
315     \l__hook_patch_prefixes_tl
316     \exp_after:wN \__hook_def_cmd:w
317     \exp_after:wN #1 \l__hook_param_text_tl
318     { #2 #4 #3 }
319   }

```

Here's the auxiliary that makes the prefix control sequences for the redefinition. Each item has to be `\tl_trim_spaces:n`'d because the last item (and not any other) has a trailing space.

```

320 \cs_new:Npn \__hook_make_prefixes:w / #1 /
321   {
322     \tl_if_empty:nF {#1}
323     {
324       \exp_not:c { \tex_ \tl_trim_spaces:n {#1} :D }

```

```

325           \__hook_make_prefixes:w /
326       }
327   }

(End of definition for \__hook_patch_expand_redefine:Nn nn, \__hook_redefine_with_hooks:Nnnn,
and \__hook_make_prefixes:w.)
```

Here are some auxiliaries for the contraption above.

```
\__hook_if_has_hash_p:n \__hook_if_has_hash:nTF
\__hook_if_has_hash:nTF \__hook_if_has_hash:w
\__hook_if_has_hash_check:w

\__hook_if_has_hash_p:n \__hook_if_has_hash:nTF searches the token list #1 for a catcode 6 token, and if any is found, it returns true, and false otherwise. The searching doesn't care about preserving groups or spaces: we can ignore those safely (braces are removed) so that searching is as fast as possible.
```

```

328 \prg_new_conditional:Npnn \__hook_if_has_hash:n #1 { TF }
329   { \__hook_if_has_hash:w #1 ## \s__hook_mark }
330 \cs_new:Npn \__hook_if_has_hash:w #1
331   {
332     \tl_if_single_token:nTF {#1}
333     {
334       \token_if_eq_catcode:NNTF ## #1
335         { \__hook_if_has_hash_check:w }
336         { \__hook_if_has_hash:w }
337     }
338     { \__hook_if_has_hash:w #1 }
339   }
340 \cs_new:Npn \__hook_if_has_hash_check:w #1 \s__hook_mark
341   { \tl_if_empty:nTF {#1} { \prg_return_false: } { \prg_return_true: } }
```

(End of definition for __hook_if_has_hash:nTF, __hook_if_has_hash:w, and
__hook_if_has_hash_check:w.)

```
\__hook_double_hashes:n \__hook_double_hashes:n loops through the token list #1 and duplicates any catcode 6 token, and expands tokens \ifx-equal to \c__hook_hashes_t1, and leaves all other tokens \notexpanded with \exp_not:N. Unfortunately pairs of explicit catcode 1 and catcode 2 character tokens are normalised to {1 and }1 because it's not feasible to expandably detect the character code (maybe it could be done using something along the lines of https://tex.stackexchange.com/a/527538, but it's far too much work for close to zero benefit).
```

__hook_double_hashes:w is the tail-recursive loop macro, that tests which of the three types of item is in the head of the token list.

```

342 \cs_new:Npn \__hook_double_hashes:n #1
343   { \__hook_double_hashes:w #1 \q__hook_recursion_tail \q__hook_recursion_stop }
344 \cs_new:Npn \__hook_double_hashes:w #1 \q__hook_recursion_stop
345   {
346     \tl_if_head_is_N_type:nTF {#1}
347     { \__hook_double_hashes_output:N }
348     {
349       \tl_if_head_is_group:nTF {#1}
350         { \__hook_double_hashes_group:n }
351         { \__hook_double_hashes_space:w }
352     }
353     #1 \q__hook_recursion_stop
354   }
```

`__hook_double_hashes_output:N` checks for the end of the token list, then checks if the token is `\c_hook_hashes_tl`, and if so just leaves it.

```

355 \cs_new:Npn \__hook_double_hashes_output:N #1
356   {
357     \if_meaning:w \q__hook_recursion_tail #1
358     \__hook_double_hashes_stop:w
359   \fi:
360   \if:w ?
361     \if_meaning:w \c_hook_hash_tl #1 ! \fi:
362     \if_meaning:w \c_hook_hashes_tl #1 ! \fi:
363     ?
364   \else:

```

(this `\use_i:nnnn` uses `\fi:` and consumes `\use:n`, the whole `\if_catcode:w` block, and the `\exp_not:N`, leaving just `#1` which is `\c_hook_hashes_tl`.)

```

365   \use_i:nnnn
366   \fi:
367   \use:n
368   {

```

If `#1` is not `\c_hook_hashes_tl`, then check if its catcode is 6, and if so, leave it doubled in `\exp_not:n` and consume the following `\exp_not:N #1`.

```

369   \if_catcode:w ## \exp_not:N #1
370     \exp_after:wN \use_i:nnnn
371   \fi:
372   \use_none:n
373   { \exp_not:n { #1 #1 } }
374 }
```

If both previous tests returned `false`, then leave the token unexpanded and resume the loop.

```

375   \exp_not:N #1
376   \__hook_double_hashes:w
377 }
378 \cs_new:Npn \__hook_double_hashes_stop:w #1 \q__hook_recursion_stop { \fi: }

Dealing with spaces and grouped tokens is trivial:
379 \cs_new:Npn \__hook_double_hashes_group:n #1
380   { { \__hook_double_hashes:n {#1} } \__hook_double_hashes:w }
381 \exp_last_unbraced:NNo
382 \cs_new:Npn \__hook_double_hashes_space:w \c_space_tl
383   { ~ \__hook_double_hashes:w }
```

(End of definition for `__hook_double_hashes:n` and others.)

4.5.2 Patching by retokenization

At this point we've drained the possibilities of patching a command by expansion-and-redefinition, so we have to resort to patching by retokenizing the command. Patching by retokenization is done by getting the `\meaning` of the command, doing the necessary manipulations on the generated string, and the retokenizing that again by using `\scantokens`.

Patching by retokenization is definitely a riskier business, because it relies that the tokens printed by `\meaning` produce the exact same tokens as the ones in the original

definition. That is, the catcode régime must be exactly(ish) the same, and there is no way of telling except by trial and error.

```
\_\_hook\_retokenize\_patch:Nnn
```

This is the macro that will control the whole process. First we'll try out one final, rather trivial case, of a command with no arguments; that is, a token list. This case can be patched with the expand-and-redefine routine but it has to be the very last case tested for, because most (all?) robust commands start with a top-level macro with no arguments, so testing this first would short-circuit `\robust@command@act` and the top-level macros would be incorrectly patched. In that case, we just check if the `\cs_parameter_spec:N` is empty, and call `__hook_patch_expand_redefine>NNnn`.

```
384 \cs_new_protected:Npn \_\_hook_retokenize_patch:Nnn #1 #2 #3
385   {
386     \str_if_eq:eeTF { \_kernel_cs_parameter_spec:N #1 } { }
387       { \_\_hook_patch_expand_redefine:NNnn \c_false_bool #1 {#2} {#3} }
388       {
389         \_\_hook_patch_debug:x { ..~command~can~only~be~patched~by~rescanning }
```

Otherwise, we start the actual patching by retokenization job. The code calls `__hook_try_patch_with_catcodes:Nnnnw` with a different catcode setting:

- The current catcode setting;
- Switching the catcode of `\@`;
- Switching the `expl3` syntax on or off;
- Both of the above.

If patching succeeds, `__hook_try_patch_with_catcodes:Nnnnw` has the side-effect of patching the macro `#1` (which may be an internal from the command whose name is `#2`).

```
390 \tl_set:Nx \l_\_hook_tmpa_tl
391   {
392     \int_compare:nNnTF { \char_value_catcode:n {'\@} } = { 12 }
393       { \exp_not:N \makeatletter } { \exp_not:N \makeatother }
394   }
395 \tl_set:Nx \l_\_hook_tmpb_tl
396   {
397     \bool_if:NTF \l_\_kernel_expl_bool
398       { \ExplSyntaxOff } { \ExplSyntaxOn }
399   }
400 \use:x
401   {
402     \exp_not:N \_\_hook_try_patch_with_catcodes:Nnnnw
403       \exp_not:n { #1 {#2} {#3} }
404       { \prg_do_nothing: }
405       { \exp_not:V \l_\_hook_tmpa_tl } % @
406       { \exp_not:V \l_\_hook_tmpb_tl } % _:
407       {
408         \exp_not:V \l_\_hook_tmpa_tl % @
409         \exp_not:V \l_\_hook_tmpb_tl % _:
410       }
411   }
412   \q_recursion_tail \q_recursion_stop
```

If no catcode setting succeeds, give up and raise an error. The command isn't changed in any way in that case.

```

413   {
414     \msg_error:n { hooks } { cant-patch }
415     { \c_backslash_str #2 } { retok }
416   }
417 }
418 }
```

(End of definition for `_hook_retokenize_patch:Nnn.`)

`_hook_try_patch_with_catcodes:Nnnnw`

This function is a simple wrapper around `_hook_cmd_if_scannable:NnTF` and `_hook_patch_retokenize:Nnnn` if the former returns `\true`, plus some debug messages.

```

```

(End of definition for `_hook_try_patch_with_catcodes:Nnnnw.`)

\kerneltmpDoNotUse This is an oddity required to be safe (as safe as reasonably possible) when patching the command. The entirety of

```
<prefixes> \def <cs> <parameter text> {<replacement text>}
```

will go through `\scantokens`. The `<parameter text>` and `<replacement text>` are what we are trying to retokenize, so not much worry there. The other items, however, should “just work”, so some care is needed to not use too fancy catcode settings. Therefore we can’t use an `expl3`-named macro for `<cs>`, nor the `expl3` versions of `\def` or the `<prefixes>`. That is why the definitions that will eventually go into `\scantokens` will use the oddly (but hopefully clearly)-named `\kerneltmpDoNotUse`:

```
457 \cs_new_eq:NN \kerneltmpDoNotUse !
```

PhO: Maybe this can be avoided by running the `<parameter text>` and the `<replacement text>` separately through `\scantokens` and then putting everything together at the end.

(End of definition for `\kerneltmpDoNotUse`.)

`_hook_patch_required_catcodes:` Here are the catcode settings that are *mandatory* when retokenizing commands. These are the minimum necessary settings to perform the definitions: they identify control sequences, which must be escaped with `_0`, delimit the definition with `\{` and `\}`, and mark parameters with `#_6`. Everything else may be changed, but not these.

```
458 \cs_new_protected:Npn \_hook_patch_required_catcodes:
459   {
460     \char_set_catcode_escape:N \\ 
461     \char_set_catcode_group_begin:N \{
462     \char_set_catcode_group_end:N \}
463     \char_set_catcode_parameter:N \#
464     % \int_set:Nn \tex_endlinechar:D { -1 }
465     % \int_set:Nn \tex_newlinechar:D { -1 }
466 }
```

PhO: etoolbox sets the `\endlinechar` and `\newlinechar` when patching, but as far as I tested these didn’t make much of a difference, so I left them out for now. Maybe `\newlinechar=-1` avoids a space token being added after the definition.

PhO: If the patching is split by `<parameter text>` and `<replacement text>`, then only # will have to stay in that list.

PhO: Actually now that we patch `\UseHook{cmd/foo/before}`, all the tokens there need to have the right catcodes, so this list now includes all lowercase letters, U and H, the slash, and whatever characters in the command name... sigh...

(End of definition for `_hook_patch_required_catcodes`.)

`_hook_cmd_if_scannable:NnTF` Here we’ll do a quick test if the command being patched can in fact be retokenized with the specific catcode setting without changing in meaning. The test is straightforward:

1. apply `\meaning` to the command;
2. split the `<prefixes>`, `<parameter text>` and `<replacement text>` and arrange them as

```
<prefixes>\def\kerneltmpDoNotUse<parameter text>{<replacement text>}
```

3. rescan that with the given catcode settings, and do the definition; then finally

4. compare `\kerneltmpDoNotUse` with the original command.

If both are `\ifx`-equal, the command can be safely patched.

```

467 \prg_new_protected_conditional:Npnn \__hook_cmd_if_scable:Nn #1 #2 { TF }

498         \c_hash_str 0 \s__hook_mark
499     }
500   }
501 \use:e
502   { \cs_new:Npn \exp_not:N \__hook_guess_arg_count:nw #1 #2 \c_hash_str #3 }
503   {
504     \int_compare:nNnTF { #1 + 1 } = {#3}
505       { \__hook_guess_arg_count:nw {#3} }
506       { #1 \__hook_use_none_delimit_by_s_mark:w }
507   }
508 \IfLatexRelease{EndIncludeInRelease}
509 \IfLatexRelease{2021/06/01}{\__hook_guess_arg_count:NN}
510 \IfLatexRelease{cmd~hooks~with~args}

```

```

511 <latexrelease>\cs_undefine:N \__hook_guess_arg_count:NN
512 <latexrelease>\EndIncludeInRelease

(End of definition for \__hook_guess_arg_count:NN, \__hook_guess_arg_count:wN, and
\__hook_guess_arg_count:nw.)

```

__hook_patch_retokenize:Nnnn Then, if __hook_cmd_if_scansable:NnTF returned true, we can go on and patch the command.

```

513 <latexrelease>\IncludeInRelease{2023/06/01}{\__hook_patch_retokenize:Nnnn}
514 <latexrelease>
515 \cs_new_protected:Npn \__hook_patch_retokenize:Nnnn #1 #2 #3 #4
516 {

```

Here, when patching by retokenization, we can only guess the number of arguments of the macro.

```

517 \__hook_guess_arg_count:NN #1 \l__hook_patch_num_args_int

```

Then we redefine the hook to have the right number of arguments. Disabling the hook, undefining the parameter token list then calling __hook_make_usable:nn are enough to redefine the hook to the extent we want. Code stored in the hook and other metadata about it are not lost in the process.

```

518 \__hook_disable:n {#2}
519 \cs_undefine:c { c__hook_##2_parameter_t1 }
520 \__hook_make_usable:nn {#2} { \l__hook_patch_num_args_int }
521 \tl_set:Ne \l__hook_tmpa_t1
522 { \exp_args:Ne \tl_to_str:n { \__hook_braced_parameter:n {#2} } }
523 \use:x
524 {
525 \str_replace_all:Nnn \exp_not:N \l__hook_tmpa_t1
526 { ##### } { \c_hash_str }
527 }

```

Then, make some things \relax to avoid lots of \noexpand below.

```

528 \cs_set_eq:NN \kerneltmpDoNotUse \scan_stop:
529 \cs_set_eq:NN \__hook_tmp:w \scan_stop:
530 \use:x
531 {

```

Now we'll define __hook_tmp:w such that it splits the \meaning of the macro (#1) into its three parts:

```

#####1. <prefixes>
#####2. <parameter text>
#####3. <replacement text>

```

and arrange that a complete definition, then place the before or after hooks around the <replacement text>: accordingly.

```

532 \cs_set:Npn \__hook_tmp:w
533 #####1 \tl_to_str:n { macro: } #####2 -> #####3 \s__hook_mark
534 {
535 #####1 \def \kerneltmpDoNotUse #####2
536 {
537 \str_if_eq:nnT {#3} { before }
538 {

```

```

539          \token_to_str:N \UseHookWithArguments {#2}
540          { \int_use:N \l__hook_patch_num_args_int }
541          \l__hook_tmpa_tl
542      }
543 #####3
544 \str_if_eq:nnT {#3} { after }
545 {
546     \token_to_str:N \UseHookWithArguments {#2}
547     { \int_use:N \l__hook_patch_num_args_int }
548     \l__hook_tmpa_tl
549 }
550 }
551

```

Now we just have to get the \meaning of the command being patched and pass it through the meat grinder above.

```

552     \tl_set:Nx \exp_not:N \l__hook_tmpa_tl
553     { \exp_not:N \__hook_tmp:w \token_to_meaning:N #1 \s__hook_mark }
554 }

```

Now rescan with the given catcode settings (overridden by the __hook_patch_required_catcodes:), and implicitly (by using the rescanned token list) carry out the definition from above.

```
555     \tl_rescan:nV { #4 \__hook_patch_required_catcodes: } \l__hook_tmpa_tl
```

And to close, copy the newly-defined command into the old name and the patching is finally completed:

```
556     \cs_gset_eq:NN #1 \kerneltmpDoNotUse
```

Finally, update the hook code.

```

557     \__hook_update_hook_code:n {#2}
558 }

```

The command `__hook_cmd_begindocument_code:` is used in an internal hook, so we need to make sure it has a harmless definition after rollback as that will not remove it from the kernel hook.

```

623 <latexrelease>\cs_set_eq:NN \__hook_cmd_begindocument_code: \prg_do_nothing:
624 <latexrelease>
625 <latexrelease>\EndModuleRelease
626 \ExplSyntaxOff

```

ltsockets.dtx

Abstract

This code implements sockets which are places in the code into which predeclared chunks of code (plugs) can be placed. Both the sockets and the plugs are “named” and each socket is assigned exactly one plug at any given time.

1 Introduction

A L^AT_EX source file is transformed into a typeset document by executing code for each command or environment in the document source. Through various steps this code transforms the input and eventually generates typeset output appearing in a “galley” from which individual pages are cut off in an asynchronous way. This page generating process is normally not directly associated with commands in the input²¹ but is triggered whenever the galley has received enough material to form another page (giving current settings).

As part of this transformation input data may get stored in some form and later reused, for example, as part of the output routine processing.

2 Configuration of the transformation process

There are three different major methods offered by L^AT_EX to configure the transformation process:

- through the template mechanism,
- through the hook mechanism, or
- through sockets and plugs.

They offer different possibilities (with different features and limitations) and are intended for specific use cases, though it is possible to combine them.

2.1 The template mechanism

The template mechanism is intended for more complex document-level elements (e.g., headings such as `\section` or environments like `itemize`). The template code implements the overall processing logic for such an element and offers a set of parameters to influence the final result.

The document element is then implemented by (a) selecting a suitable template (there may be more than one available for the kind of document element) and (b) by setting its parameters to desired values. This then forms a so-called instance which is executed when the document element is found in the source.

By altering the parameter values (in a document class or in the document preamble) or, if more drastic layout changes are desired, by selecting a different template and

²¹Expects for directives such as `\newpage`.

then adjusting its parameters, a wide variety of layouts can be realized through simple configuration setups without the need to develop new code.

The target audience of this method are therefore document class developers or users who wish to alter an existing layout (implemented by a document class) in certain (minor) ways.

The template mechanism is currently documented as part of the `xtemplate` package and one more elaborate implementation can be found as part of the `latex-lab` code for lists (to be documented further).

2.2 The hook mechanism

Hooks are places in the kernel code (or in packages) that offer packages the possibility to inject additional code at specific points in the processing in a controlled way without the need to replace the existing code block (and thereby overwriting modifications/extensions made by other packages). The target audience is therefore mainly package developers, even though some hooks can be useful for document authors.

Obviously, what can reasonably be added into a hook depends on the individual hook (hopefully documented as part of the hook documentation), but in general the idea behind hooks is that more than one package could add code into the hook at the same time. Perhaps the most famous hook (that L^AT_EX had for a very long time) is `begindocument` into which many packages add code to through `\AtBeginDocument{\(code)}` (which is nowadays implemented as a shorthand for `\AddToHook{begindocument}{\(code)}`). To resolve possible conflicts between injections by different packages there is a rule mechanism by which code chunks in a hook can be ordered in a certain way and by which incompatible packages can be detected if a resolution is impossible.

In contrast to template code, there is no standard configuration method through parameters for hooks, i.e., the code added to a hook “is” the configuration. If it wants to provide for configuration through parameters it has to also provide its own method to set such parameters in some way. However, in that case it is likely that using a hook is not the right approach and the developer better calls a template instance instead which then offers configuration through a key/value interface.

In most cases, hooks do not take any arguments as input. Instead, the data that they can (and are allowed to) access depends on the surrounding context.

For example, the various hooks available during the page shipout process in L^AT_EX’s output routine can (and have to) access the accumulated page material stored in a box named `\ShipoutBox`. This way, code added to, say, the `shipout/before` hook could access the page content, alter it, and then write it back into `\ShipoutBox` and any other code added to this hook could then operate on the modified content. Of course, for such a scheme to work the code prior to executing the hook would need to setup up data in appropriate places and the hook documentation would need to document what kind of storage can be accessed (and possibly altered) by the hook.

There are also hooks that take arguments (typically portions of document data) and in that case the hook code can access these arguments through #1, #2, etc.

The hook mechanism is documented in `lthooks-doc.pdf`.

2.3 The socket mechanism

In some cases there is code that implements a certain programming logic (for example, combining footnotes, floats, and the text for the current page to be shipped out) and

if this logic should change (e.g., footnotes to be placed above bottom floats instead of below) then this whole code block needs to be replaced with different code.

In theory, this could be implemented with templates, i.e., the code simply calls some instance that implements the logic and that instance is altered by selecting a different templates and/or adjusting their parameters. However, in many cases customization through parameters is overkill in such a case (or otherwise awkward, because parameterization is better done on a higher level instead of individually for small blocks of code) and using the template mechanism just to replace one block of code with a different one results in a fairly high performance hit. It is therefore usually not a good choice.

In theory, it would also be possible to use a hook, but again that is basically a misuse of the concept, because in this use case there should never be more than one block of code inside the hook; thus, to alter the processing logic one would need to set up rules that replace code rather than (as intended) execute all code added to the hook.

For this reason L^AT_EX now offers a third mechanism: “sockets” into which one can place exactly one code block — a “plug”.

In a nutshell: instead of having a fixed code block somewhere as part of the code, implementing a certain programming logic there is a reference to a named socket at this point. This is done by first declaring the named socket with:

```
\NewSocket{\langle socket-name\rangle}{\langle number-of-inputs\rangle}
```

This is then referenced at the point where the replaceable code block should be executed with:

```
\UseSocket{\langle socket-name\rangle}
```

or, if the socket should take a number of inputs (additional arguments beside the name) with

```
\UseSocket{\langle socket-name\rangle}{\langle arg_1\rangle}...{\langle arg_{\langle number-of-inputs\rangle}\rangle}
```

In addition, several code blocks (a.k.a. plugs) implementing different logic for this socket are set up, each with a declaration of the form:

```
\NewSocketPlug{\langle socket-name\rangle}{\langle socket-plug-name\rangle}{\langle code\rangle}
```

Finally, one of them is assigned to the socket:

```
\AssignSocketPlug{\langle socket-name\rangle}{\langle socket-plug-name\rangle}
```

If the programming logic should change, then all that is necessary is to make a new assignment with `\AssignSocketPlug` to a different `\langle socket-plug-name\rangle`. This assignment obeys scope so that an environment can alter a socket without the need to restore the previous setting manually.

If the socket takes inputs, then those need to be provided to `\UseSocket` and in that case they can be referenced in the `\langle code\rangle` argument of `\NewSocketPlug` with #1, #2, etc.

In most cases a named socket is used only in a single place, but there is, of course, nothing wrong with using it in several places, as long as the code in all places is supposed to change in the same way.

2.3.1 Examples

We start by declaring a new socket named `foo` that expects two inputs:

```
\NewSocket{foo}{2}
```

Such a declaration has to be unique across the whole L^AT_EX run. Thus, if another package attempts to use the same name (regardless of the number of inputs) it will generate an error:

```
\NewSocket{foo}{2}
\NewSocket{foo}{1}
```

Both declarations would therefore produce:

```
! LaTeX socket Error: Socket 'foo' already declared!
```

You also get an error if you attempt to declare some socket plug and the socket name is not yet declared, e.g.,

```
\NewSocketPlug{baz}{undeclared}{some code}
```

generates

```
! LaTeX socket Error: Socket 'baz' undeclared!
```

Setting up plugs for the socket is done like this:

```
\NewSocketPlug{foo}{plug-A}
  {\begin{quote}\itshape foo-A: #1!#2\end{quote}}
\NewSocketPlug{foo}{plug-B}
  {\begin{quote}\sffamily foo-B: #2\textsuperscript{2}\end{quote}}
```

This will set up the plugs `plug-A` and `plug-B` for this socket.

We still have to assign one or the other to the socket, thus without doing that the line

```
\UseSocket{foo}{hello}{world}
```

produces nothing because the default plug for sockets with 2 inputs is `noop` (which grabs the additional arguments and throws them away).²²

So let's do the assignment

```
\AssignSocketPlug{foo}{plug-A}
```

and then

```
\UseSocket{foo}{hello}{world}
```

will properly typeset

foo-A: hello!world

and after

```
\AssignSocketPlug{foo}{plug-B}
```

²²If socket `foo` would have been a socket with one input, then the default plug would be `identity`, in which case the socket input would remain without braces and gets typeset!

and another call to

```
\UseSocket{foo}{hello}{world}
```

we get

```
foo-B: world2
```

If we attempt to assign a plug that was not defined, e.g.,

```
\AssignSocketPlug{foo}{plug-C}
```

then we get an error during the assignment

```
! LaTeX socket Error: Plug 'plug-C' for socket 'foo' undeclared!
```

and the previous assignment remains in place.

To see what is known about a socket and its plugs you can use `\ShowSocket` or `\LogSocket` which displays information similar to this on the terminal or in the transcript file:

```
Socket foo:  
    number of inputs = 2  
    available plugs = noop, plug-A, plug-B  
    current plug = plug-B  
    definition = \long macro:#1#2->\begin {quote}\sffamily  
    foo-B: #2\textsuperscript {2}\end {quote}
```

2.3.2 Details and semantics

In this section we collect some normative statements.

- From a functional point of view sockets are like simple T_EX macros, i.e., they expect 0 to 9 mandatory arguments (the socket inputs) and get replaced by their “expansion”
- A socket is “named” and the name consists of ASCII letters [a-z], [A-Z], [0-9], [-/\@] only
- Socket names have to be unique, i.e., there can be only one socket named `\name`. This is ensured by declaring each socket with `\NewSocket`.

However, there is no requirement that sockets and hook names have to be different. In fact, if a certain action that could otherwise be specified as hook code has to be executed always last (or first) one could ensure this by placing a socket (single action) after a hook (or vice versa) and using the same name to indicate the relationship, e.g.,

```
\UseHook{foo}      % different package can add code here  
\UseSocket{foo}   % only one package can assign a plug
```

This avoids the need to order the hook code to ensure that something is always last.

- Best practice naming conventions are ... *to be documented*

- A socket has documented inputs which are
 - the positional arguments (if any) with a description of what they contain when used
 - implicit data (registers and other 2e/expl3 data stores) that the socket is allowed to make use of, with a documented description of what they contain (if relevant for the task at hand—no need to describe the whole L^AT_EX universe)
 - information about the state of the T_EX engine (again when relevant), e.g. is called in mmode or vmode or in the output routine or ...
 - ... anything missing?
- A socket has documented results/outputs which can be
 - what kind of data it should write to the current list (if that is part of its task)
 - what kind of registers and other 2e/expl3 data stores it should modify and in what way
 - what kind of state changes it should do (if any)
 - ... *anything else?*
- At any time a socket has one block of code (a plug :-)) associated with it. Such code is itself named and the association is done by linking the socket name to the code name (putting a plug into the socket).
- The name of a plug consists of ASCII letters [a-z], [A-Z], [0-9], [-@] only.
- Socket plug names have to be unique within on a per socket basis, but it is perfectly allowed (and sensible in some cases) to use the same plug name with different sockets (where based on the sockets' purposes, different actions may be associated with the plug name). For example `noop` is a plug name declared for every socket, yet its action “grab the socket inputs and throw them away” obviously differs depending on how many inputs the socket has.
- When declaring a plug it is stated for which socket it is meant (i.e., its code can only be used with that socket). This means that the same plug name can be used with different sockets referring to different code in each case.
- Configuration of a socket can only be done by linking different code to it. Nevertheless the code linked to it can provide its own means of configuration (but this is outside of the spec).
- Technically execution of a socket (`\UseSocket`) involves
 - doing any house keeping (like writing debugging info, ...);
 - looking up the current code association (what plug is in the socket);
 - executing this code which will pick up the mandatory arguments (happens at this point, not before), i.e., it is like calling a csname defined with
`\def\foo#1#2...{...#1...#2...}`
 - do some further house keeping (if needed).
- A socket is typically only used in one place in code, but this is not a requirement, i.e., if the same operation with the same inputs need to be carried out in several places the same named socket can be used.

2.3.3 Command syntax

We give both the L^AT_EX 2 _{ε} and the L3 programming layer command names.

```
\NewSocket      \NewSocket    {\langle socket-name\rangle} {\langle number-of-inputs\rangle}
\socket_new:nn  \socket_new:nn {\langle socket-name\rangle} {\langle number-of-inputs\rangle}
```

Declares a new socket with name *<socket-name>* having *<number-of-inputs>* inputs. There is automatically a plug *noop* declared for it, which does nothing, i.e., it gobbles the socket inputs (if any). This is made the default plug except for sockets with one input which additionally define the plug *identity* and assign that as their default.

This *identity* plug simply returns the socket input without its outer braces. The use case for this plug are situations like this:

```
\UseSocket{tagsupport/footnote}{\langle code\rangle}
```

If tagging is not active and the socket contains the plug *identity* then this returns *\langle code\rangle* without the outer braces and to activate tagging all that is necessary is to change the plug to say *tagpdf* so that it surrounds *\langle code\rangle* by some tagging magic. This is the most common use case for sockets with one input, which is why they have this special default.

The socket documentation should describe its purpose, its inputs and the expected results as discussed above.

The declaration is only allowed at top-level, i.e., not inside a group.

```
\NewSocketPlug   \NewSocketPlug  {\langle socket-name\rangle} {\langle socket-plug-name\rangle} {\langle code\rangle}
\socket_new_plug:nnn \socket_new_plug:nnn {\langle socket-name\rangle} {\langle socket-plug-name\rangle} {\langle code\rangle}
\socket_set_plug:nnn \socket_set_plug:nnn {\langle socket-name\rangle} {\langle socket-plug-name\rangle} {\langle code\rangle}
```

Declares a new plug for socket *<socket-name>* that runs *<code>* when executing. It complains if the plug was already declared previously.

The form *\socket_set_plug:nnn* changes an existing plug. As this should normally not be necessary, we currently have only an L3 layer name for the few cases it might be useful.

The declarations can be made inside a group and obey scope, i.e., they vanish if the group ends.

```
\AssignSocketPlug \AssignSocketPlug {\langle socket-name\rangle} {\langle socket-plug-name\rangle}
\socket_assign_plug:nn \socket_assign_plug:nn {\langle socket-name\rangle} {\langle socket-plug-name\rangle}
```

Assigns the plug *<socket-plug-name>* to the socket *<socket-name>*. It errors if either socket or plug is not defined.

The assignment is local, i.e., it obeys scope.

\UseSocket	\UseSocket { <i>socket-name</i> }
\socket_use:nw	\socket_use:nm { <i>socket-name</i> } { <i>socket-arg₁</i> } { <i>socket-arg₂</i> }
\socket_use:n	Executes the socket <i>socket-name</i> by retrieving the <i>code</i> of the current plug assigned to the socket. This is the only command that would appear inside macro code in packages.
\socket_use:nn	
\socket_use:nnn	
\socket_use:nnnn	For performance reasons there is no explicit check that the socket was declared!

The different L3 programming layer commands are really doing the same thing: they grab as many arguments as defined as inputs for the socket and then pass them to the plug. The different names are only there to make the code more readable, i.e., to indicate how many arguments are grabbed in total (note that no runtime check is made to verify that this is actually true). We only provide them for sockets with up to 3 inputs (most likely those with zero or one input would have been sufficient). If you happen to have a socket with more inputs, use \socket_use:nw.

\socket_use_expandable:nw *	\socket_use_expandable:n { <i>socket-name</i> }
\socket_use_expandable:n *	

Fully expandable variant of \socket_use:n. This can be used in macro code to retrieve code from sockets which need to appear in an expandable context.

This usually requires the plug to only contain expandable code and should therefore only be used for sockets which are clearly documented to be used in an expandable context. This command does not print any debugging info when \DebugSocketsOn is active and should therefore be avoided whenever possible.

For performance reasons there is no explicit check that the socket was declared!

\ShowSocket	\ShowSocket { <i>socket-name</i> }
\LogSocket	\socket_show:n { <i>socket-name</i> }
\socket_show:n	Displays information about the socket <i>socket-name</i> and its state then stops and waits for further instructions — at the moment some what rudimentary.
\socket_log:n	\LogSocket and \socket_log:n only differ in that they don't stop.

It is sometimes necessary/helpful to know if a particular socket or plug exists (or is assigned to a certain socket) and based on that take different actions.

\IfSocketExistsTF *	\IfSocketExistsTF { <i>socket-name</i> } { <i>true code</i> } { <i>false code</i> }
\socket_if_exist:nTF *	If socket <i>socket-name</i> exists then execute <i>true code</i> otherwise <i>false code</i> . Variants with only T or F are also available.

\IfSocketPlugExistsTF	* \IfSocketPlugExistsTF { <i>socket-name</i> } { <i>plug-name</i> }
\socket_if_plug_exist:nnTF *	{ <i>true code</i> } { <i>false code</i> }

If plug *plug-name* for socket *socket-name* exists then execute *true code* otherwise *false code*. Variants with only T or F are also available.

\IfSocketPlugAssignedTF	* \IfSocketPlugAssignedTF { <i>socket-name</i> } { <i>plug-name</i> }
\socket_if_plug_assigned:nnTF *	{ <i>true code</i> } { <i>false code</i> }

If plug *plug-name* is assigned to socket *socket-name* then execute *true code* otherwise *false code*. Variants with only T or F are also available.

<code>\DebugSocketsOn</code>	<code>\DebugSocketsOn ... \DebugSocketsOff</code>
<code>\DebugSocketsOff</code>	
<code>\socket_debug_on:</code>	Turns debugging of sockets on or off.
<code>\socket_debug_off:</code>	

2.3.4 Rationale for error handling

The errors during the declarations are produced to help with typos—after all, such declarations might be part of a document preamble (not that likely, but possible). However, `\UseSocket` is not doing much checking, e.g.,

```
\UseSocket{misplaced-socket}{hello}{world}
```

will generate a rather low-level error and then typesets “helloworld” because there is no dedicated runtime check if `misplaced-socket` is a known socket.

The reason is that if the misspelling is in the code, then this is a programming error in the package and for speed reasons L^AT_EX does not repeatedly make runtime checks for coding errors unless they can or are likely to be user introduced.

3 The Implementation

The implementation of the socket mechanism should be (partially) redone and we should probably store the different code chunks in a property list so that we can have a decent `\ShowSocket` command that shows the available alternatives.

TODO: *implement?*

```

1  {*2ekernel | latexrelease}
2  \ExplSyntaxOn
3  <@@=socket>
4  <| latexrelease> \NewModuleRelease{2023/11/01}{ltsockets}
5  <| latexrelease>                                {The~socket~management~system}
```

3.1 Debugging the socket structures

Code and commands in this section are not final, it needs more experimentation to see what kind of tracing information is going to be useful in practice. For now the tracing is mainly meant to be used for code testing and not so much for application testing.

It is quite likely that the commands and the behavior of the tracing might change in the future once we gained some experience with it.

<code>\g__socket_debug_bool</code>	Holds the current debugging state.
	<code>6 \bool_new:N \g__socket_debug_bool</code>
	<i>(End of definition for <code>\g__socket_debug_bool</code>.)</i>
<code>\socket_debug_on:</code>	Turns debugging on and off by redefining <code>__socket_debug:n</code> and <code>__socket_debug_-term:n</code> . By default they do nothing.
<code>\socket_debug_off:</code>	
<code>__socket_debug:n</code>	<code>7 \cs_new_eq:NN __socket_debug:n \use_none:n</code>
<code>__socket_debug_term:n</code>	<code>8 \cs_new_eq:NN __socket_debug_term:n \use_none:n</code>
<code>__socket_debug_gset:</code>	

```

9 \cs_new_protected:Npn \socket_debug_on:
10 {
11     \bool_gset_true:N \g__socket_debug_bool
12     \__socket_debug_gset:
13 }
14 \cs_new_protected:Npn \socket_debug_off:
15 {
16     \bool_gset_false:N \g__socket_debug_bool
17     \__socket_debug_gset:
18 }
19 \cs_new_protected:Npn \__socket_debug_gset:
20 {
21     \cs_gset_protected:Npx \__socket_debug:n ##1
22     { \bool_if:NT \g__socket_debug_bool {##1} }
23     \cs_gset_protected:Npx \__socket_debug_term:n ##1
24     { \bool_if:NT \g__socket_debug_bool
25         { \iow_term:x { ^~J [Sockets]~ ==>~ ##1} } }
26 }

```

(End of definition for `\socket_debug_on`: and others. These functions are documented on page 343.)

3.2 The L3 layer commands

`\socket_new:nn`

Declaring a socket creates a str to hold the name (a pointer) to the code that should be used when the socket is executed, and an integer to hold the number of inputs of that socket. Initially, an “empty” code chunk is created and assigned so the socket does nothing by default other than swallowing its inputs (if any).

```

27 \cs_new_protected:Npn \socket_new:nn #1 #2 {
28     \socket_if_exist:nTF {#1}
29     {
30         \msg_error:nnn { socket } { already-declared } {#1}
31     }
32 }

```

We only support declarations on top-level.

```

33     \int_if_zero:nTF \tex_currentgrouplevel:D
34     {
35         \str_new:c { l__socket_#1_plug_str }
36         \seq_new:c { l__socket_#1_plugs_seq }
37         \int_const:cn { c__socket_#1_args_int } {#2}
38         \socket_new_plug:nnn {#1} { noop } {}
39         \int_compare:nNnTF {#2} = 1
40         {
41             \socket_new_plug:nnn {#1} { identity } {##1}
42             \socket_assign_plug:nn {#1} { identity }
43         }
44         { \socket_assign_plug:nn {#1} { noop } }
45         \__socket_debug_term:n
46         { \Socket~ '#1'~ declared~ with~ #2~ input(s) }
47     }
48     {
49         \msg_error:nn { socket } { not-top-level }
50     }
51 }

```

52 }

(End of definition for \socket_new:nn. This function is documented on page 341.)

\socket_if_exist_p:n Conditional testing the existance of a socket. The argument is fully expanded as part of the csname generation.

```
53 \prg_new_conditional:Npnn \socket_if_exist:n #1 { p , T , F , TF }
54   { \str_if_exist:cTF { l__socket_#1_plug_str }
55     \prg_return_true:
56     \prg_return_false:
57 }
```

(End of definition for \socket_if_exist:nTF. This function is documented on page 342.)

\socket_log:n Show the current state of the socket — for now this is just a quick draft and should be redone and extended.

```
58 \cs_new_protected:Npn \socket_log:n #1 {
59   \typeout{ Socket~ #1:}
60   \socket_if_exist:nTF {#1}
61   {
62     \typeout{ \@spaces number~ of~ inputs~ ==
63               \int_use:c { c__socket_#1_args_int } }
64     \typeout{ \@spaces available~plugs~ ==
65               \seq_use:cnnn { l__socket_#1_plugs_seq }{,}{,}{,}{,} }
66     \typeout{ \@spaces current~ plug~ ==
67               \str_use:c { l__socket_#1_plug_str } }
68     \typeout{ \@spaces definition~ ==
69               \cs_meaning:c
70               { __socket_#1_plug_ \str_use:c { l__socket_#1_plug_str } :w } }
71     \typeout{ }
72   }
73 }
```

If we are showing a socket it is not an error if it doesn't exist.

```
74   \typeout { Socket~ is~ not~ declared! }
75 }
76 }
```

And here the version that stops:

```
77 \cs_new_protected:Npn \socket_show:n #1 {\socket_log:n {#1} \errmessage{}}
```

(End of definition for \socket_log:n and \socket_show:n. These functions are documented on page 342.)

\socket_new_plug:nnn Declaring a code for a socket is just making a definition, taking the number of arguments from the saved int.

```
78 \cs_new_protected:Npn \socket_new_plug:nnn #1#2#3 {
79   \socket_if_exist:nTF {#1}
80   {
81     \socket_if_plug_exist:nnTF {#1} {#2}
82     {
83       \msg_error:nnnn { socket } { plug-already-declared } {#1} {#2}
84     }
85     {
86       \cs_generate_from_arg_count:cNnn
```

```

87     { __socket_#1_plug_#2:w }
88     \cs_new:Npn
89     { \int_use:c { c__socket_#1_args_int } }
90     {#3}

```

This is a new declaration so we add the name to a seq for the debugging info.

```

91     \seq_put_right:cn { l__socket_#1_plugs_seq } {#2}
92     \__socket_debug_term:n
93     { Plug~ '#2'~ for~ socket~ '#1'~ declared. }
94     }
95   }
96   { \msg_error:nnn { socket } { undeclared } {#1} }
97 }

```

Changing the plug of an existing socket is rather similar, except that we don't have to deal with adding it to the debugging sequence.

```

98 \cs_new_protected:Npn \socket_set_plug:nnn #1#2#3 {
99   \socket_if_exist:nTF {#1}
100   {
101     \socket_if_plug_exist:nnTF {#1} {#2}
102     {
103       \cs_generate_from_arg_count:cNnn
104       { __socket_#1_plug_#2:w }
105       \cs_set:Npn
106       { \int_use:c { c__socket_#1_args_int } }
107       {#3}
108     \__socket_debug_term:n
109     { Plug~ '#2'~ for~ socket~ '#1'~ changed. }
110   }
111   {
112     \msg_error:nnnn { socket } { plug-undeclared } {#1} {#2}
113   }
114 }
115 { \msg_error:nnn { socket } { undeclared } {#1} }
116 }

```

(End of definition for `\socket_new_plug:nnn` and `\socket_set_plug:nnn`. These functions are documented on page [341](#).)

`\socket_if_plug_exist_p:nn` Conditional testing the existance of a plug. Both arguments are fully expanded as part of the csname generation.

```

117 \prg_new_conditional:Npnn \socket_if_plug_exist:nn #1#2 { p , T , F , TF }
118   { \cs_if_exist:cTF { __socket_#1_plug_#2:w }
119     \prg_return_true:
120     \prg_return_false:
121   }

```

(End of definition for `\socket_if_plug_exist:nnTF`. This function is documented on page [342](#).)

`\socket_assign_plug:nn` Assigning a plug to a socket just changes the name in the socket string. The assignment is local to the current group.

```

122 \cs_new_protected:Npn \socket_assign_plug:nn #1 #2 {
123   \socket_if_exist:nTF {#1}
124   {
125     \socket_if_plug_exist:nnTF {#1} {#2}

```

```

126      {
127          \__socket_debug_term:n
128              { Replacing~ plug~ '\str_use:c { l__socket_#1_plug_str }'~
129                  with~ '#2'~ in~ socket~ '#1'. }
130              \str_set:cn { l__socket_#1_plug_str } {#2}
131      }
132      {
133          \msg_error:nnn { socket } { plug-undeclared } {#1} {#2}
134      }
135  { \msg_error:nnn { socket } { undeclared } {#1} }
136
137 }

```

(End of definition for `\socket_assign_plug:nn`. This function is documented on page 341.)

`\socket_if_plug_assigned:p:nn` Conditional testing the assignment of a plug. Both arguments are fully expanded.

```

138 \prg_new_conditional:Npnn \socket_if_plug_assigned:nn #1#2 { p , T , F , TF }
139     { \exp_args:Ne
140         \str_if_eq:nnTF {#2} { l__socket_#1_plug_str }
141             \prg_return_true:
142             \prg_return_false:
143     }

```

(End of definition for `\socket_if_plug_assigned:nnTF`. This function is documented on page 342.)

`\socket_use:nw`
`\socket_use:n`
`\socket_use:nn`
`\socket_use:nnn`
`\socket_use:nnnn` And using it is more or less a `\use:c` so very lightweight. We do not add a runtime check for speed reasons!

This command is named `\socket_use:nw` because we don't know how many inputs the socket has until we have looked at the socket name (in argument #1). But, of course, the developer knows so we also offer a few aliases `\socket_use:nn`, etc. so that one can indicate the correct number of arguments (socket inputs plus one) in the L3 layer code.

```

144 \cs_new_protected:Npn \socket_use:nw #1 {
145     \__socket_debug_term:n
146     { Socket~ '#1'~ containing~ plug~
147         '\str_use:c { l__socket_#1_plug_str }'~ used. }
148     \use:c { __socket_#1_plug_ \str_use:c { l__socket_#1_plug_str } :w }
149 }

```

To make code a bit more readable we also define functions that indicate how many arguments are picked up. However, this is just for code documentation: internally they all do the same and the number of arguments isn't checked by default.

```

150 \cs_new_eq:NN \socket_use:n \socket_use:nw    % socket with no inputs
151 \cs_new_eq:NN \socket_use:nn \socket_use:nw    % socket with one input
152 \cs_new_eq:NN \socket_use:nnn \socket_use:nw   % socket with two inputs
153 \cs_new_eq:NN \socket_use:nnnn \socket_use:nw  % socket with three inputs

```

The above commands could be changed to check how many inputs the socket is declared with (for example, when checking is in force).

TODO: Implement?

(End of definition for `\socket_use:nw` and others. These functions are documented on page 342.)

```
\socket_use_expandable:nw The same as the non-expandable code, except for the missing debug output.
\socket_use_expandable:n
154 \cs_new:Npn \socket_use_expandable:nw #1 {
155   \use:c { __socket_#1_plug_ \str_use:c { l__socket_#1_plug_str } :w }
156 }
157 \cs_new_eq:NN \socket_use_expandable:n \socket_use_expandable:nw      % socket with no inputs

(End of definition for \socket_use_expandable:nw and \socket_use_expandable:n. These functions
are documented on page 342.)
```

File 11

lttemplates.dtx

1 Introduction

There are three broad “layers” between putting down ideas into a source file and ending up with a typeset document. These layers of document writing are

1. authoring of the text with mark-up;
2. document layout design;
3. implementation (with `TeX` programming) of the design.

We write the text as an author, and we see the visual output of the design after the document is generated; the `TeX` implementation in the middle is the glue between the two.

`LATEX`’s greatest success has been to standardise a system of mark-up that balances the trade-off between ease of reading and ease of writing to suit almost all forms of technical writing. It’s other original strength was a good background in typographical design; while the standard `LATEX 2 ϵ` classes look somewhat dated now in terms of their visual design, their typography is generally sound (barring the occasional minor faults).

However, `LATEX 2 ϵ` has always lacked a standard approach to customising the visual design of a document. Changing the looks of the standard classes involved either:

- Creating a new version of the implementation code of the class and editing it.
- Loading one of the many packages to customise certain elements of the standard classes.
- Loading a completely different document class, such as `KOMA-Script` or `memoir`, that allows easy customization.

All three of these approaches have their drawbacks and learning curves.

The idea behind `lttemplates` is to cleanly separate the three layers introduced at the beginning of this section, so that document authors who are not programmers can easily change the design of their documents. `lttemplates` also makes it easier for `LATEX` programmers to provide their own customizations on top of a pre-existing class.

2 What is a document?

Besides the textual content of the words themselves, the source file of a document contains mark-up elements that add structure to the document. These elements include sectional divisions, figure/table captions, lists of various sorts, theorems/proofs, and so on. The list will be different for every document that can be written.

Each element can be represented logically without worrying about the formatting, with mark-up such as `\section`, `\caption`, `\begin{enumerate}` and so on. The output of each one of these document elements will be a typeset representation of the information marked up, and the visual arrangement and design of these elements can vary widely in producing a variety of desired outcomes.

For each type of document element, there may be design variations that contain the same sort of information but present it in slightly different ways. For example, the difference between a numbered and an unnumbered section, `\section` and `\section*`, or the difference between an itemized list or an enumerated list.

There are three distinct layers in the definition of “a document” at this level

1. semantic elements such as the ideas of sections and lists;
2. a set of design solutions for representing these elements visually;
3. specific variations for these designs that represent the elements in the document.

In the parlance of the template system, these are called types, templates, and instances, and they are discussed below in sections 4, 5, and 7, respectively.

3 Types, templates, and instances

By formally declaring documents to be composed of mark-up elements grouped into types, which are interpreted and typeset with a set of templates, each of which has one or more instances with which to compose each and every semantic unit of the text, we can cleanly separate the components of document construction.

All of the structures provided by the template system are global, and do not respect T_EX grouping.

4 Template types

An *template type* (sometimes just “type”) is an abstract idea of a document element that takes a fixed number of arguments corresponding to the information from the document author that it is representing. A sectioning type, for example, might take three inputs: “title”, “short title”, and “label”.

Any given document class will define which types are to be used in the document, and any template of a given type can be used to generate an instance for the type. (Of course, different templates will produce different typeset representations, but the underlying content will be the same.)

```
\NewTemplateType \NewTemplateType {\langle template type \rangle} {\langle no. of args \rangle}
```

This function defines an *⟨template type⟩* taking *⟨number of arguments⟩*, where the *⟨type⟩* is an abstraction as discussed above. For example,

```
\NewTemplateType{sectioning}{3}
```

creates a type “sectioning”, where each use of that type will need three arguments.

5 Templates

A *template* is a generalized design solution for representing the information of a specified type. Templates that do the same thing, but in different ways, are grouped together by their type and given separate names. There are two important parts to a template:

- the parameters it takes to vary the design it is producing;

Key-type	Description of input
<code>boolean</code>	<code>true</code> or <code>false</code>
<code>choice{⟨choices⟩}</code>	A list of pre-defined <code>⟨choices⟩</code>
<code>commalist</code>	A comma-separated list
<code>function{⟨N⟩}</code>	A function definition with N arguments (N from 0 to 9)
<code>instance{⟨name⟩}</code>	An instance of type <code>⟨name⟩</code>
<code>integer</code>	An integer or integer expression
<code>length</code>	A fixed length
<code>muskip</code>	A math length with shrink and stretch components
<code>real</code>	A real (floating point) value
<code>skip</code>	A length with shrink and stretch components
<code>tokenlist</code>	A token list: any text or commands

Table 1: Key-types for defining template interfaces with `\DeclareTemplateInterface`.

- the implementation of the design.

As a document author or designer does not care about the implementation but rather only the interface to the template, these two aspects of the template definition are split into two independent declarations, `\DeclareTemplateInterface` and `\DeclareTemplateCode`.

`\DeclareTemplateInterface` `\DeclareTemplateInterface`
 $\{\langle type \rangle\} \{\langle template \rangle\} \{\langle no. of args \rangle\}$
 $\{\langle key list \rangle\}$

A `⟨template⟩` interface is declared for a particular `⟨type⟩`, where the `⟨number of arguments⟩` must agree with the type declaration. The interface itself is defined by the `⟨key list⟩`, which is itself a key–value list taking a specialized format:

```

⟨key1⟩ ":" ⟨key type1⟩ ","
⟨key2⟩ ":" ⟨key type2⟩ ","
⟨key3⟩ ":" ⟨key type3⟩ "=" ⟨default3⟩ ","
⟨key4⟩ ":" ⟨key type4⟩ "=" ⟨default4⟩ ","
...

```

Each `⟨key⟩` name should consist of ASCII characters, with the exception of `,`, `=` and `⋮`. The recommended form for key names is to use lower case letters, with dashes to separate out different parts. Spaces are ignored in key names, so they can be included or missed out at will. Each `⟨key⟩` must have a `⟨key type⟩`, which defined the type of input that the `⟨key⟩` requires. A full list of key types is given in Table 1. Each key may have a `⟨default⟩` value, which will be used in by the template if the `⟨key⟩` is not set explicitly. The `⟨default⟩` should be of the correct form to be accepted by the `⟨key type⟩` of the `⟨key⟩`: this is not checked by the code. Expressions for numerical values are evaluated when the template is used, thus for example values given in terms of `em` or `ex` will be set respecting the prevailing font.

```
\KeyValue \KeyValue {<key name>}
```

There are occasions where the default (or value) for one key should be taken from another. The `\KeyValue` function can be used to transfer this information without needing to know the internal implementation of the key:

```
\DeclareTemplateInterface { type } { template } { no. of args }
{
    key-name-1 : key-type = value ,
    key-name-2 : key-type = \KeyValue { key-name-1 },
    ...
}
```

```
\DeclareTemplateCode \DeclareTemplateCode
{<type>} {<template>} {<no. of args>}
{<key bindings>} {<code>}
```

The relationship between a templates keys and the internal implementation is created using the `\DeclareTemplateCode` function. As with `\DeclareTemplateInterface`, the `<template>` name is given along with the `<type>` and `<number of arguments>` required. The `<key bindings>` argument is a key–value list which specifies the relationship between each `<key>` of the template interface with an underlying `<variable>`.

```
<key1> "=" <variable1>,
<key2> "=" <variable2>,
<key3> "=" global <variable3>,
<key4> "=" global <variable4>,
...
```

With the exception of the choice, code and function key types, the `<variable>` here should be the name of an existing L^AT_EX3 register. As illustrated, the key word “global” may be included in the listing to indicate that the `<variable>` should be assigned globally. A full list of variable bindings is given in Table 2.

The `<code>` argument of `\DeclareTemplateCode` is used as the replacement text for the template when it is used, either directly or as an instance. This may therefore accept arguments #1, #2, *etc.* as detailed by the `<number of arguments>` taken by the type.

```
\AssignTemplateKeys \AssignTemplateKeys
```

In the final argument of `\DeclareTemplateCode` the assignment of keys defined by the template may be delayed by including the command `\AssignTemplateKeys`. If this is *not* present, keys are assigned immediately before the template code. If an `\AssignTemplateKeys` command is present, assignment is delayed until this point. Note that the command must be *directly* present in the code, not placed within a nested command/macro.

Key-type	Description of binding
<code>boolean</code>	Boolean variable, e.g. <code>\l_tmpa_bool</code>
<code>choice</code>	List of choice implementations (see Section 6)
<code>commalist</code>	Comma list, e.g. <code>\l_tmpa_clist</code>
<code>function</code>	Function taking N arguments, e.g. <code>\use_i:nn</code>
<code>instance</code>	
<code>integer</code>	Integer variable, e.g. <code>\l_tmpa_int</code>
<code>length</code>	Dimension variable, e.g. <code>\l_tmpa_dim</code>
<code>muskip</code>	Muskip variable, e.g. <code>\l_tmpa_muskip</code>
<code>real</code>	Floating-point variable, e.g. <code>\l_tmpa_fp</code>
<code>skip</code>	Skip variable, e.g. <code>\l_tmpa_skip</code>
<code>tokenlist</code>	Token list variable, e.g. <code>\l_tmpa_t1</code>

Table 2: Bindings required for different key types when defining template implementations with `\DeclareTemplateCode`. Apart from `code`, `choice` and `function` all of these accept the key word `global` to carry out a global assignment.

<code>\SetKnownTemplateKeys</code>	<code>\SetKnownTemplateKeys {<type>} {<template>} {<keyvals>}</code>
<code>\SetTemplateKeys</code>	<code>\SetTemplateKeys {<type>} {<template>} {<keyvals>}</code>
<code>\UnusedTemplateKeys</code>	<code>\UnusedTemplateKeys % all <keyvals> unused by previous \SetKnownTemplateKeys</code>

In the final argument of `\DeclareTemplateCode` one can also overwrite (some of) the current template key value settings by using the command `\SetKnownTemplateKeys` or `\SetTemplateKeys`, i.e., they can overwrite the template default values and the values assigned by the instance.

The `\SetKnownTemplateKeys` and `\SetTemplateKeys` commands are only supported within the code of a template; using them elsewhere has unpredictable results. If they are used together with `\AssignTemplateKeys` then the latter command should come first in the template code.

The main use case for these commands is the situation where there is an argument (normally `#1`) to the template in which a key/value list can be specified that overwrites the normal settings. In that case one could use

```
\SetKnownTemplateKeys{<type>}{<template>}{#1}
```

to process this key/value list inside the template.

If `\SetKnownTemplateKeys` is executed and the `<keyvals>` argument contains keys not known to the `<template>` they are simply ignored and stored in the tokenlist `\UnusedTemplateKeys` without generating an error. This way it is possible to apply the same key/val list specified by the user on a document-level command or environment to several templates, which is useful, if the command or environment is implemented by calling several different template instances.

As a variation of that, you can use this key/val list the first time, and for the next template instance use what remains in `\UnusedTemplateKeys` (i.e., the key/val list with only the keys that have not been processed previously). The final processing step could then be `\SetTemplateKeys`, which unconditionally attempts to set the `<keyvals>` received in its third argument. This command complains if any of them are unknown keys. Alternatively, you could use `\SetKnownTemplateKeys` and afterwards

check whether `\UnusedTemplateKeys` is empty.²³

For example, a list, such as `enumerate`, is made up from a `blockenv`, `block`, `list`, and a `para` template and in the single user-supplied optional argument of `enumerate` key/values for any of these templates might be specified.

In fact, in the particular example of list environments, the supplied key/value list is also saved and then applied to each `\item` which is implemented through an `item` template. This way, one can specify one-off settings for all the items of a single list (on the environment level), as well as to individual items within that list (by specifying them in the optional argument of an `\item`). With `\SetKnownTemplateKeys` and `\SetTemplateKeys` working together, it is possible to provide this flexibility and still alert the user when one of their keys is misspelled.

On the other hand you may want to allow for “misspellings” without generating an error or a warning. For example, if you define a template that accepts only a few keys, you might just want to ignore anything specified in the source when you use this template in place of a different one, without the need to alter the document source. Or you might just generate a warning message, which is easy, given that the unused key/values are available in the `\UnusedTemplateKeys` variable.

```
\DeclareTemplateCopy \DeclareTemplateCopy
  {<type>} {<template2>} {<template1>}
```

Copies `<template1>` of `<type>` to a new name `<template2>`: the copy can then be edited independent of the original.

6 Multiple choices

The `choice` key type implements multiple choice input. At the interface level, only the list of valid choices is needed:

```
\DeclareTemplateInterface { foo } { bar } { 0 }
  { key-name : choice { A, B, C } }
```

where the choices are given as a comma-list (which must therefore be wrapped in braces). A default value can also be given:

```
\DeclareTemplateInterface { foo } { bar } { 0 }
  { key-name : choice { A, B, C } = A }
```

At the implementation level, each choice is associated with code, using a nested key-value list.

```
\DeclareTemplateCode { foo } { bar } { 0 }
{
  key-name =
  {
    A = Code-A ,
    B = Code-B ,
    C = Code-C
```

²³Using `\SetTemplateKeys` exposes the inner structure of the template keys when generating an error. This is something one may want to avoid as it can be confusing to the user, especially if several templates are involved. In that case use `\SetKnownTemplateKeys` and afterwards check whether `\UnusedTemplateKeys` is empty; if it is not empty then generate your own error message.

```

        }
    }
{ ... }
```

The two choice lists should match, but in the implementation a special `unknown` choice is also available. This can be used to ignore values and implement an “else” branch:

```
\DeclareTemplateCode { foo } { bar } { 0 }
{
    key-name =
    {
        A      = Code-A ,
        B      = Code-B ,
        C      = Code-C ,
        unknown = Else-code
    }
}
{ ... }
```

The `unknown` entry must be the last one given, and should *not* be listed in the interface part of the template.

For keys which accept the values `true` and `false` both the boolean and choice key types can be used. As template interfaces are intended to prompt clarity at the design level, the boolean key type should be favored, with the choice type reserved for keys which take arbitrary values.

7 Instances

After a template is defined it still needs to be put to use. The parameters that it expects need to be defined before it can be used in a document. Every time a template has parameters given to it, an *instance* is created, and this is the code that ends up in the document to perform the typesetting of whatever pieces of information are input into it.

For example, a template might say “here is a section with or without a number that might be centered or left aligned and print its contents in a certain font of a certain size, with a bit of a gap before and after it” whereas an instance declares “this is a section with a number, which is centered and set in 12 pt italic with a 10 pt skip before and a 12 pt skip after it”. Therefore, an instance is just a frozen version of a template with specific settings as chosen by the designer.

`\DeclareInstance \DeclareInstance
 {type} {instance} {template} {parameters}`

This function uses a *template* for an *type* to create an *instance*. The *instance* will be set up using the *parameters*, which will set some of the *keys* in the *template*.

As a practical example, consider a type for document sections (which might include chapters, parts, sections, *etc.*), which is called **sectioning**. One possible template for this type might be called **basic**, and one instance of this template would be a numbered section. The instance declaration might read:

```
\DeclareInstance { sectioning } { section-num } { basic }  
{  
  numbered      = true ,  
  justification = center ,  
  font          = \normalsize\itshape ,  
  before-skip   = 10pt ,  
  after-skip    = 12pt ,  
}
```

Of course, the key names here are entirely imaginary, but illustrate the general idea of fixing some settings.

`\IfInstanceExistsT \IfInstanceExistsTF {type} {instance} {true code} {false code}`

`\IfInstanceExistsF`
`\IfInstanceExistsTF`

Tests if the named *instance* of a *type* exists, and then inserts the appropriate code into the input stream.

`\DeclareInstanceCopy \DeclareInstanceCopy
 {type} {instance2} {instance1}`

Copies the *values* for *instance1* for an *type* to *instance2*.

8 Document interface

After the instances have been chosen, document commands must be declared to use those instances in the document. `\UseInstance` calls instances directly, and this command should be used internally in document-level mark-up.

`\UseInstance \UseInstance
 {type} {instance} {arguments}`

Uses an *instance* of the *type*, which will require *arguments* as determined by the number specified for the *type*. The *instance* must have been declared before it can be used, otherwise an error is raised.

```
\UseTemplate \UseTemplate {<type>} {<template>}<br/>{<settings>} <arguments>
```

Uses the *<template>* of the specified *<type>*, applying the *<settings>* and absorbing *<arguments>* as detailed by the *<type>* declaration. This in effect is the same as creating an instance using `\DeclareInstance` and immediately using it with `\UseInstance`, but without the instance having any further existence. This command is therefore useful when a template needs to be used only once.

This function can also be used as the argument to `instance` key types:

```
\DeclareInstance { type } { template } { instance }<br/>{<br/>    instance-key =<br/>        \UseTemplate { type2 } { template2 } { <settings> }<br/>}
```

9 Changing existing definitions

Template parameters may be assigned specific defaults for instances to use if the instance declaration doesn't explicitly set those parameters. In some cases, the document designer will wish to edit these defaults to allow them to "cascade" to the instances. The alternative would be to set each parameter identically for each instance declaration, a tedious and error-prone process.

```
\EditTemplateDefaults \EditTemplateDefaults<br/>{<type>} {<template>} {<new defaults>}
```

Edits the *<defaults>* for a *<template>* for an *<type>*. The *<new defaults>*, given as a key-value list, replace the existing defaults for the *<template>*. This means that the change will apply to instances declared after the editing, but that instances which have already been created are unaffected.

```
\EditInstance \EditInstance<br/>{<type>} {<instance>} {<new values>}
```

Edits the *<values>* for an *<instance>* for an *<type>*. The *<new values>*, given as a key-value list, replace the existing values for the *<instance>*. This function is complementary to `\EditTemplateDefaults`: `\EditInstance` changes a single instance while leaving the template untouched.

10 Getting information about templates and instances

```
\ShowInstanceValues \ShowInstanceValues {<type>} {<instance>}
```

Shows the *<values>* for an *<instance>* of the given *<type>* at the terminal.

```
\ShowTemplateCode \ShowTemplateCode {<type>} {<template>}
```

Shows the *<code>* of a *<template>* for an *<type>* in the terminal.

<code>\ShowTemplateDefaults</code>	<code>\ShowTemplateDefaults {<type>} {<template>}</code>	Shows the <code><default></code> values of a <code><template></code> for an <code><type></code> in the terminal.
<code>\ShowTemplateInterface</code>	<code>\ShowTemplateInterface {<type>} {<template>}</code>	Shows the <code><keys></code> and associated <code><key types></code> of a <code><template></code> for an <code><type></code> in the terminal.
<code>\ShowTemplateVariables</code>	<code>\ShowTemplateVariables {<type>} {<template>}</code>	Shows the <code><variables></code> and associated <code><keys></code> of a <code><template></code> for an <code><type></code> in the terminal. Note that <code>code</code> and <code>choice</code> keys do not map directly to variables but to arbitrary code. For <code>choice</code> keys, each valid choice is shown as a separate entry in the list, with the key name and choice separated by a space, for example <pre>Template 'example' of type 'example' has variable mapping: > demo unknown => \def \demo{?} > demo c => \def \demo{c} > demo b => \def \demo{b} > demo a => \def \demo{a}.</pre> would be shown for a choice key <code>demo</code> with valid choices <code>a</code> , <code>b</code> and <code>c</code> , plus code for an <code>unknown</code> branch.

11 The implementation

```

Internal quarks.

```
40 \quark_new:N \q__template_nil
```

```
\_\_template_quark_if_nil_p:n
```

Branching quark conditional.

```
41 \_\_kernel_quark_new_conditional:Nn \_\_template_quark_if_nil:N { F }
```

(End of definition for __template_quark_if_nil:nTF.)

11.2 Testing existence and validity

There are a number of checks needed for either the existence of a type, template or instance. There are also some for the validity of a particular call. All of these are collected up here.

`__template_execute_if_arg_agree:nmT`

A test agreement between the number of arguments for the template type and that specified when creating a template. This is not done as a separate conditional for efficiency and better error message

```

42 \cs_new_protected:Npn \_\_template\_execute\_if\_arg\_agree:nmT #1#2#3
43 {
44     \prop_get:NnN \g_\_\_template_type_prop {#1} \l_\_\_template_tmp_tl
45     \int_compare:nNnTF {#2} = \l_\_\_template_tmp_tl
46         {#3}
47         {
48             \msg_error:nneee { template } { argument-number-mismatch }
49             {#1} { \l_\_\_template_tmp_tl } {#2}
50         }
51     }

```

(End of definition for `__template_execute_if_arg_agree:nmT`.)

`__template_execute_if_code_exist:nnT`

A template is only fully declared if the code has been set up, which can be checked by looking for the template function itself.

```

52 \cs_new_protected:Npn \_\_template\_execute\_if\_code\_exist:nnT #1#2#3
53 {
54     \cs_if_exist:cTF { \c_\_\_template_code_root_tl #1 / #2 }
55         {#3}
56         { \msg_error:nnnn { template } { no-template-code } {#1} {#2} }
57     }

```

(End of definition for `__template_execute_if_code_exist:nnT`.)

`__template_execute_if_keytype_exist:nT`
`__template_execute_if_keytype_exist:VT`

The test for valid keytypes looks for a function to set up the key, which is part of the “code” side of the template definition. This avoids having different lists for the two parts of the process.

```

58 \cs_new_protected:Npn \_\_template\_execute\_if\_keytype\_exist:nT #1#2
59 {
60     \cs_if_exist:cTF { \c_\_\_template_store_value_ #1 :n }
61         {#2}
62         { \msg_error:nnn { template } { unknown-keytype } {#1} }
63     }
64 \cs_generate_variant:Nn \_\_template\_execute\_if\_keytype\_exist:nT { V }

```

(End of definition for `__template_execute_if_keytype_exist:nT`.)

`__template_execute_if_type_exist:nT`

To check that a particular type is valid.

```

65 \cs_new_protected:Npn \_\_template\_execute\_if\_type\_exist:nT #1#2
66 {
67     \prop_if_in:NnTF \g_\_\_template_type_prop {#1}
68         {#2}
69         { \msg_error:nnn { template } { unknown-type } {#1} }
70     }

```

(End of definition for `__template_execute_if_type_exist:nT`.)

```

\_\_template\_execute\_if\_keys\_exist:nnt
To check that the keys for a template have been set up before trying to create any code,
a simple check for the correctly-named keytype property list.

71 \cs_new_protected:Npn \_\_template\_if\_keys\_exist:nnt #1#2#3
72 {
73     \cs_if_exist:cTF { \c__template_keytypes_root_tl #1 / #2 }
74     {#3}
75     { \msg_error:nnnn { template } { unknown-template } {#1} {#2} }
76 }

(End of definition for \_\_template\_execute\_if\_keys\_exist:nnt.)

\_\_template\_if\_key\_value:nTF
\_\_template\_if\_key\_value:VTF
Tests for the first token in a string being \KeyValue.

77 \prg_new_conditional:Npnn \_\_template\_if\_key\_value:n #1 { T , F , TF }
78 {
79     \str_if_eq:noTF { \KeyValue } { \tl_head:w #1 \q_nil \q_stop }
80     \prg_return_true:
81     \prg_return_false:
82 }
83 \prg_generate_conditional_variant:Nnn \_\_template\_if\_key\_value:n { V } { T , F , TF }

(End of definition for \_\_template\_if\_key\_value:nTF.)

\_\_template\_if\_instance\_exist:nnTF
Testing for an instance

84 \prg_new_conditional:Npnn \_\_template\_if\_instance\_exist:nn #1#2 { T , F , TF }
85 {
86     \cs_if_exist:cTF { \c__template_instances_root_tl #1 / #2 }
87     \prg_return_true:
88     \prg_return_false:
89 }

(End of definition for \_\_template\_if\_instance\_exist:nnTF.)

\_\_template\_if\_use\_template:nTF
Tests for the first token in a string being \UseTemplate.

90 \prg_new_conditional:Npnn \_\_template\_if\_use\_template:n #1 { TF }
91 {
92     \str_if_eq:noTF { \UseTemplate } { \tl_head:w #1 \q_nil \q_stop }
93     \prg_return_true:
94     \prg_return_false:
95 }

(End of definition for \_\_template\_if\_use\_template:nTF.)

```

11.3 Saving and recovering property lists

The various property lists for templates have to be shuffled in and out of storage.

The defaults and keytypes are transferred from the scratch property lists to the “proper” lists for the template being created.

```

96 \cs_new_protected:Npn \_\_template\_store\_defaults:nn
97 {
98     \debug_suspend:
99     \prop_gclear_new:c { \c__template_defaults_root_tl #1 / #2 }
100    \prop_gset_eq:cN { \c__template_defaults_root_tl #1 / #2 }
101    \l__template_values_prop

```

```

102      \debug_resume:
103    }
104 \cs_new_protected:Npn \__template_store_keytypes:nn #1#2
105 {
106   \debug_suspend:
107   \prop_if_exist:cTF { \c_template_keytypes_root_tl #1 / #2 }
108   {
109     \msg_info:nnnn { template } { declare-template-interface } {#1} {#2}
110     \prop_gclear:c { \c_template_keytypes_root_tl #1 / #2 }
111   }
112   { \prop_new:c { \c_template_keytypes_root_tl #1 / #2 } }
113   \prop_gset_eq:cN { \c_template_keytypes_root_tl #1 / #2 }
114   \l_template_keytypes_prop
115   \seq_gclear_new:c { \c_template_key_order_root_tl #1 / #2 }
116   \seq_gset_eq:cN { \c_template_key_order_root_tl #1 / #2 }
117   \l_template_key_order_seq
118   \debug_resume:
119 }
120 \cs_new_protected:Npn \__template_store_values:nn #1#2
121 {
122   \debug_suspend:
123   \prop_clear_new:c { \c_template_values_root_tl #1 / #2 }
124   \prop_set_eq:cN { \c_template_values_root_tl #1 / #2 }
125   \l_template_values_prop
126   \debug_resume:
127 }
128 \cs_new_protected:Npn \__template_store_vars:nn #1#2
129 {
130   \debug_suspend:
131   \prop_gclear_new:c { \c_template_vars_root_tl #1 / #2 }
132   \prop_gset_eq:cN { \c_template_vars_root_tl #1 / #2 }
133   \l_template_vars_prop
134   \debug_resume:
135 }

```

(End of definition for `__template_store_defaults:nn` and others.)

`__template_recover_defaults:nn`
`__template_recover_keytypes:nn`
`__template_recover_values:nn`

Recovering the stored data for a template is rather less complex than storing it. All that happens is the data is transferred from the permanent to the scratch storage. However, we need to check the scratch storage does exist.

```

\__template_recover_vars:nn
136 \cs_new_protected:Npn \__template_recover_defaults:nn #1#2
137 {
138   \prop_if_exist:cTF
139   {
140     \c_template_defaults_root_tl #1 / #2
141   }
142   {
143     \prop_set_eq:Nc \l_template_values_prop
144     { \c_template_defaults_root_tl #1 / #2 }
145   }
146   { \prop_clear:N \l_template_values_prop }
147
148 \cs_new_protected:Npn \__template_recover_keytypes:nn #1#2
149   {
150     \prop_if_exist:cTF
151     { \c_template_keytypes_root_tl #1 / #2 }

```

```

150      {
151          \prop_set_eq:Nc \l__template_keytypes_prop
152              { \c__template_keytypes_root_tl #1 / #2 }
153      }
154      { \prop_clear:N \l__template_keytypes_prop }
155      \seq_if_exist:cTF { \c__template_key_order_root_tl #1 / #2 }
156      {
157          \seq_set_eq:Nc \l__template_key_order_seq
158              { \c__template_key_order_root_tl #1 / #2 }
159      }
160      { \seq_clear:N \l__template_key_order_seq }
161  }
162 \cs_new_protected:Npn \__template_recover_values:nn #1#2
163  {
164      \prop_if_exist:cTF
165          { \c__template_values_root_tl #1 / #2 }
166      {
167          \prop_set_eq:Nc \l__template_values_prop
168              { \c__template_values_root_tl #1 / #2 }
169      }
170      { \prop_clear:N \l__template_values_prop }
171  }
172 \cs_new_protected:Npn \__template_recover_vars:nn #1#2
173  {
174      \prop_if_exist:cTF
175          { \c__template_vars_root_tl #1 / #2 }
176      {
177          \prop_set_eq:Nc \l__template_vars_prop
178              { \c__template_vars_root_tl #1 / #2 }
179      }
180      { \prop_clear:N \l__template_vars_prop }
181  }

```

(End of definition for `__template_recover_defaults:nn` and others.)

11.4 Creating new template types

Although the type is the “top level” of the template system, it is actually very easy to implement. All that happens is that the number of arguments required is recorded, indexed by the name of the type.

```

182 \cs_new_protected:Npn \__template_define_type:nn #1#2
183  {
184      \prop_if_in:NnTF \g__template_type_prop {#1}
185          { \msg_error:nnn { template } { type-already-defined } {#1} }
186          { \__template_declare_type:nn {#1} {#2} }
187  }
188 \cs_new_protected:Npn \__template_declare_type:nn #1#2
189  {
190      \int_set:Nn \l__template_tmp_int {#2}
191      \int_compare:nTF { 0 <= \l__template_tmp_int <= 9 }
192      {
193          \msg_info:nnnV { template } { declare-type }
194              {#1} \l__template_tmp_int
195          \prop_gput:NnV \g__template_type_prop {#1}

```

```

196         \l__template_tmp_int
197     }
198 {
199     \msg_error:nnnV { template } { bad-number-of-arguments }
200     {#1} \l__template_tmp_int
201 }
202 }
```

(End of definition for __template_define_type:nn and __template_declare_type:nn.)

11.5 Design part of template declaration

The “design” part of a template declaration defines the general behaviour of each key, and possibly a default value. However, it does not include the implementation. This means that what happens here is the two properties are saved to appropriate lists, which can then be used later to recover the information when implementing the keys.

The main function for the “design” part of creating a template starts by checking that the type exists and that the number of arguments required agree. If that is all fine, then the two storage areas for defaults and keytypes are initialised. The mechanism is then set up for the l3keys module to actually parse the keys. Finally, the code hands off to the storage routine to save the parsed information properly.

```

203 \cs_new_protected:Npn \_\_template_declare_template_keys:nnnn #1#2#3#4
204 {
205     \_\_template_execute_if_type_exist:nT {#1}
206     {
207         \_\_template_execute_if_arg_agree:nnT {#1} {#3}
208         {
209             \prop_clear:N \l__template_values_prop
210             \prop_clear:N \l__template_keytypes_prop
211             \seq_clear:N \l__template_key_order_seq
212             \keyval_parse>NNn
213             \_\_template_parse_keys_elt:n \_\_template_parse_keys_elt:nn {#4}

218 }
```

(End of definition for __template_declare_template_keys:nnnn.)

Processing the key part of the key–value pair is always carried out using this function, even if a value was found. First, the key name is separated from the keytype, and if necessary the keytype is separated into two parts. This information is then used to check that the keytype is valid, before storing the keytype (plus argument if necessary) as a property of the key name. The key name is also stored (in braces) in the token list to record the order the keys are defined in.

```

318     }
319 }

```

(End of definition for `_template_split_keytype:n` and `_template_split_keytype_aux:w`.)

```
\_template_split_keytype_arg:n
\_template_split_keytype_arg:V
\_template_split_keytype_arg_aux:n
\_template_split_keytype_arg_aux:w
```

The second stage of sorting out the keytype is to check for an argument. As there is no convenient delimiting token to look for, a check is made instead for each possible text value for the keytype. To keep things faster, this only involves the keytypes that need an argument. If a match is made, then a check is also needed to see that it is at the start of the keytype information. All being well, the split can then be applied. Any non-matching keytypes are assumed to be “correct” as given, and are left alone (this is checked by other code).

```

11.5.1 Storing values

As `lttemplates` pre-processes key values for efficiency reasons, there is a need to convert the values given as defaults into “ready to use” data. The same general idea is true when an instance is declared. However, assignments are not made until an instance is used, and so there has to be some intermediate storage. Furthermore, the ability to delay evaluation of results is needed. To achieve these aims, a series of “process and store” functions are defined here.

All of the information about the key (the key name and the keytype) is already stored as variables. The same property list is always used to store the data, meaning that the only argument required is the value to be processed and potentially stored.

```
\_\_template\_store\_value\_boolean:n
352 \cs_new_protected:Npn \_\_template\_store\_value\_boolean:n #1
353   { \prop_put:Non \l_\_template\_values\_prop \l_\_template\_key\_name_tl {#1} }

(End of definition for \_\_template\_store\_value\_boolean:n.)
```

With no need to worry about delayed evaluation, these keytypes all just store the input directly.

```
354 \cs_new_protected:Npn \_\_template\_store\_value:n #1
355   { \prop_put:Non \l_\_template\_values\_prop \l_\_template\_key\_name_tl {#1} }
356 \cs_new_eq:NN \_\_template\_store\_value\_choice:n \_\_template\_store\_value:n
357 \cs_new_eq:NN \_\_template\_store\_value\_function:n \_\_template\_store\_value:n
358 \cs_new_eq:NN \_\_template\_store\_value\_instance:n \_\_template\_store\_value:n

(End of definition for \_\_template\_store\_value:n and others.)
```

Storing values in `\l__template_values_prop` is in most cases the same.

```
359 \cs_new_protected:Npn \_\_template\_store\_value\_aux:Nn #1#2
360   { \prop_put:Non \l_\_template\_values\_prop \l_\_template\_key\_name_tl {#2} }

371 \cs_new_protected:Npn \_\_template\_store\_value\_tokenlist:n
372   { \_\_template\_store\_value\_aux:Nn \use:n }
373 \cs_new_eq:NN \_\_template\_store\_value\_commalist:n \_\_template\_store\_value\_tokenlist:n

(End of definition for \_\_template\_store\_value\_aux:Nn and others.)
```

11.6 Implementation part of template declaration

The main function for implementing a template starts with a couple of simple checks to make sure that there are no obvious mistakes: the number of arguments must agree and the template keys must have been declared.

```
374 \cs_new_protected:Npn \_\_template\_declare\_template\_code:nnnnn #1#2#3#4#5
375   {
376     \_\_template\_execute_if_type_exist:nT {#1}
377     {
378       \_\_template\_execute_if_arg_agree:nnT {#1} {#3}
379       {
380         \_\_template\_if_keys_exist:nnT {#1} {#2}
381         {
382           \_\_template\_store\_key\_implementation:nnn {#1} {#2} {#4}
383           \str_if_in:nnTF {#5} { AssignTemplateKeys }
```

```

384     {
385         \regex_match:nnTF { \c { AssignTemplateKeys } } {#5}
386         { \__template_declare_template_code:nnnn {#1} {#2} {#3} {#5} }
387         {
388             \__template_declare_template_code:nnnn
389             {#1} {#2} {#3} { \AssignTemplateKeys #5 }
390         }
391     }
392     {
393         \__template_declare_template_code:nnnn
394         {#1} {#2} {#3} { \AssignTemplateKeys #5 }
395     }
396 }
397 }
398 }
399 }
400 \cs_new_protected:Npn \__template_declare_template_code:nnnn #1#2#3#4
401 {
402     \cs_if_exist:cT { \c__template_code_root_tl #1 / #2 }
403     { \msg_info:nnnn { template } { declare-template-code } {#1} {#2} }
404     \cs_generate_from_arg_count:cNnn
405     { \c__template_code_root_tl #1 / #2 }
406     \cs_gset_protected:Npn {#3} {#4}
407 }

```

(End of definition for __template_declare_template_code:nnnn and __template_declare_template_code:nnnn.)

__template_store_key_implementation:nnn

Actually storing the implementation part of a template is quite easy as it only requires the list of keys given to be turned into a property list. There is also some error-checking to do, hence the need to have the list of defined keytypes available. In certain cases (when choices are involved) parsing the key results in changes to the default values. That is why they are loaded and then saved again.

```

408 \cs_new_protected:Npn \__template_store_key_implementation:nnn #1#2#3
409 {
410     \__template_recover_defaults:nn {#1} {#2}
411     \__template_recover_keytypes:nn {#1} {#2}
412     \prop_clear:N \l__template_vars_prop
413     \keyval_parse:nnn
414     { \__template_parse_vars_elt:n } { \__template_parse_vars_elt:nnn { #1 / #2 } } {#3}
415     \__template_store_vars:nn {#1} {#2}
416     \prop_map_inline:Nn \l__template_keytypes_prop
417     { \msg_error:nnnn { template } { key-not-implemented } {##1} {#2} {#1} }
418 }

```

(End of definition for __template_store_key_implementation:nnn.)

__template_parse_vars_elt:n

At the implementation stage, every key must have a value given. So this is an error function.

```

419 \cs_new_protected:Npn \__template_parse_vars_elt:n #1
420   { \msg_error:nnn { template } { key-no-variable } {#1} }

```

(End of definition for __template_parse_vars_elt:n.)

```

\__template_parse_vars_elt:nnn
\__template_parse_vars_elt_aux:nn
\__template_parse_vars_elt_aux:nw
\__template_parse_vars_elt_aux:nnn
\__template_parse_vars_elt_aux:nne
\__template_parse_vars_elt_key:nn

```

The actual storage part here is very simple: the storage bin name is placed into the property list. At the same time, a comparison is made with the keytypes defined earlier: if there is a mismatch then an error is raised.

```

421 \cs_new_protected:Npn \__template_parse_vars_elt:nnn #1#2#3
422 {
423     \tl_set:Ne \l__template_key_name_tl
424         { \tl_trim_spaces:e { \tl_to_str:n {#2} } }
425     \prop_get:NVNTF \l__template_keytypes_prop
426         \l__template_key_name_tl
427         \l__template_keytype_tl
428         {
429             \__template_split_keytype_arg:V \l__template_keytype_tl
430             \__template_parse_vars_elt_aux:nn {#1} {#3}
431             \prop_remove:NV \l__template_keytypes_prop \l__template_key_name_tl
432         }
433         { \msg_error:nnn { template } { unknown-key } {#2} }
434     }

```

Split off any leading `global` and they look for the way to implement.

```

435 \cs_new_protected:Npn \__template_parse_vars_elt_aux:nn #1#2

603     \l_\_template_key_name_tl {#1}
604 }
```

(End of definition for __template_choice_elt:nnn and others.)

11.7 Editing template defaults

Editing the template defaults means getting the values back out of the store, then parsing the list of new values before putting the updated list back into storage.

```
605 \cs_new_protected:Npn \_\_template\_edit\_defaults:nnn #1#2#3
```

```

606  {
607      \__template_if_keys_exist:nnT {#1} {#2}
608      {
609          \__template_recover_defaults:nn {#1} {#2}
610          \__template_parse_values:nnn {#1} {#2} {#3}
611          \__template_store_defaults:nn {#1} {#2}
612      }
613  }

```

(End of definition for `__template_edit_defaults:nnn`.)

`__template_parse_values:nnn`

The routine to parse values is the same for both editing a template and setting up an instance. So the code here does only the minimum necessary for reading the values.

```

614 \cs_new_protected:Npn \__template_parse_values:nnn #1#2#3
615  {
616      \__template_recover_keytypes:nn {#1} {#2}
617      \keyval_parse>NNn
618      \__template_parse_values_elt:n \__template_parse_values_elt:nn {#3}
619  }

```

(End of definition for `__template_parse_values:nnn`.)

`__template_parse_values_elt:n`

Every key needs a value, so this is just an error routine.

```

620 \cs_new_protected:Npn \__template_parse_values_elt:n #1
621  {
622      \bool_set_true:N \l__template_error_bool
623      \msg_error:nnn { template } { key-no-value } {#1}
624  }

```

(End of definition for `__template_parse_values_elt:n`.)

`__template_parse_values_elt:nn`
`__template_parse_values_elt_aux:n`

To store the value, find the keytype then call the saving function. These need the current key name saved as `\l__template_key_name_tl`.

```

625 \cs_new_protected:Npn \__template_parse_values_elt:nn #1#2
626  {
627      \tl_set:Ne \l__template_key_name_tl
628      { \tl_trim_spaces:e { \tl_to_str:n {#1} } }
629      \prop_get:NVNTF \l__template_keytypes_prop \l__template_key_name_tl
630      \l__template_tmp_tl
631      { \__template_parse_values_elt_aux:n {#2} }
632      { \msg_error:nnV { template } { unknown-key } \l__template_key_name_tl }
633  }
634 \cs_new_protected:Npn \__template_parse_values_elt_aux:n #1
635  {
636      \__template_split_keytype_arg:V \l__template_tmp_tl
637      \use:c { __template_store_value_ \l__template_keytype_tl :n } {#1}
638  }

```

(End of definition for `__template_parse_values_elt:nn` and `__template_parse_values_elt_aux:n`.)

`__template_template_set_eq:nnn`

To copy a template, each of the lists plus the code has to be copied across. To keep this independent of the list storage system, it is all done with two-part shuffles.

```

639 \cs_new_protected:Npn \__template_template_set_eq:nnn #1#2#3
640  {
641      \__template_recover_defaults:nn {#1} {#3}

```

```

642     \__template_store_defaults:nn {#1} {#2}
643     \__template_recover_keytypes:nn {#1} {#3}
644     \__template_store_keytypes:nn {#1} {#2}
645     \__template_recover_vars:nn {#1} {#3}
646     \__template_store_vars:nn {#1} {#2}
647     \cs_if_exist:cT { \c__template_code_root_tl #1 / #2 }
648     { \msg_info:nnnn { template } { declare-template-code } {#1} {#2} }
649     \cs_gset_eq:cc { \c__template_code_root_tl #1 / #2 }
650     { \c__template_code_root_tl #1 / #3 }
651 }

```

(End of definition for `__template_template_set_eq:nnn`.)

11.8 Creating instances of templates

Making an instance has two distinct parts. First, the keys given are parsed to transfer the values into the structured data format used internally. This allows the default and given values to be combined with no repetition. In the second step, the structured data is converted to pre-defined variable assignments, and these are stored in the function for the instance.

```

652 \cs_new_protected:Npn \__template_declare_instance:nnnn #1#2#3#4
653 {
654     \__template_execute_if_code_exist:nnT {#1} {#2}
655     {
656         \__template_recover_defaults:nn {#1} {#2}
657         \__template_recover_vars:nn {#1} {#2}
658         \__template_declare_instance_aux:nnnn {#1} {#2} {#3} {#4}
659     }
660 }
661 \cs_new_protected:Npn \__template_declare_instance_aux:nnnn #1#2#3#4
662 {
663     \bool_set_false:N \l__template_error_bool
664     \__template_parse_values:nnn {#1} {#2} {#4}
665     \bool_if:NF \l__template_error_bool
666     {
667         \prop_put:Nnn \l__template_values_prop { from-template } {#2}
668         \__template_store_values:nn {#1} {#3}
669         \__template_convert_to_assignments:
670         \cs_if_exist:cT { \c__template_instances_root_tl #1 / #3 }
671         { \msg_info:nnnn { template } { declare-instance } {#3} {#1} }
672         \cs_set_protected:cpe { \c__template_instances_root_tl #1 / #3 }
673         {
674             \exp_not:N \__template_assignments_push:n
675             { \exp_not:V \l__template_assignments_tl }
676             \exp_not:c { \c__template_code_root_tl #1 / #2 }
677         }
678     }
679 }

```

(End of definition for `__template_declare_instance:nnnn` and
`__template_declare_instance_aux:nnnn`.)

`__template_instance_set_eq:nnn` Copy–paste an instance.

```
680 \cs_new_protected:Npn \__template_instance_set_eq:nnn #1#2#3
```

```

681  {
682    \__template_if_instance_exist:nnTF {#1} {#3}
683    {
684      \__template_recover_values:nn {#1} {#3}
685      \__template_store_values:nn {#1} {#2}
686      \cs_if_exist:cT { \c__template_instances_root_tl #1 / #2 }
687      { \msg_info:nnnn { template } { declare-instance } {#2} {#1} }
688      \cs_set_eq:cc { \c__template_instances_root_tl #1 / #2 }
689      { \c__template_instances_root_tl #1 / #3 }
690    }
691    { \msg_error:nnnn { template } { unknown-instance } {#1} {#3} }
692  }

```

(End of definition for `__template_instance_set_eq:nnn`.)

Editing an instance is almost identical to declaring one. The only variation is the source of the values to use. When editing, they are recovered from the previous instance run.

```

693 \cs_new_protected:Npn \__template_edit_instance:nnn #1#2#3
694  {
695    \__template_if_instance_exist:nnTF {#1} {#2}
696    {
697      \__template_recover_values:nn {#1} {#2}
698      \prop_get:NnN \l__template_values_prop { from~template }
699      \l__template_tmp_tl
700      \__template_edit_instance_aux:nVnn
701      {#1} \l__template_tmp_tl {#2} {#3}
702    }
703    { \msg_error:nnnn { template } { unknown-instance } {#1} {#2} }
704  }
705 \cs_new_protected:Npn \__template_edit_instance_aux:nnnn #1#2#3#4
706  {
707    \__template_recover_vars:nn {#1} {#2}
708    \__template_declare_instance_aux:nnnn {#1} {#2} {#3} {#4}
709  }
710 \cs_generate_variant:Nn \__template_edit_instance_aux:nnnn { nV }

(End of definition for \__template_edit_instance:nnn and \__template_edit_instance_aux:nnnn.)

```

The idea on converting to a set of assignments is to loop over each key, so that the loop order follows the declaration order of the keys. This is done using a sequence as property lists are not “ordered”.

```

711 \cs_new_protected:Npn \__template_convert_to_assignments:
712  {
713    \tl_clear:N \l__template_assignments_tl
714    \seq_map_function:NN \l__template_key_order_seq
715    \__template_convert_to_assignments_aux:n
716  }
717 \cs_new_protected:Npn \__template_convert_to_assignments_aux:n #1
718  {
719    \prop_get:NnN \l__template_keytypes_prop {#1} \l__template_tmp_tl
720    \__template_convert_to_assignments_aux:nV {#1} \l__template_tmp_tl
721  }

```

The second auxiliary function actually does the work. The arguments here are the key name (#1) and the keytype (#2). From those, the value to assign and the name of the appropriate variable are recovered. A bit of work is then needed to sort out keytypes with arguments (for example instances), and to look for global assignments. Once that is done, a hand-off can be made to the handler for the relevant keytype.

```

722 \cs_new_protected:Npn \__template_convert_to_assignments_aux:nn #1#2
723 {
724   \prop_get:NnNT \l__template_values_prop {#1} \l__template_value_tl
725   {
726     \prop_get:NnNTF \l__template_vars_prop {#1} \l__template_var_tl
727     {
728       \__template_split_keytype_arg:n {#2}
729       \str_if_eq:VnF \l__template_keytype_tl { choice }
730       {
731         \str_if_eq:VnF \l__template_keytype_tl { code }
732         { \__template_find_global: }
733       }
734       \tl_set:Nn \l__template_key_name_tl {#1}
735       \cs_if_exist_use:cF { __template_assign_ \l__template_keytype_tl : }
736       { \__template_assign_variable: }
737     }
738     { \msg_error:nnn { template } { unknown-attribute } {#1} }
739   }
740 }
741 \cs_generate_variant:Nn \__template_convert_to_assignments_aux:nn { nv }

(End of definition for \__template_convert_to_assignments:,
 \__template_convert_to_assignments_aux:n, and \__template_convert_to_assignments_aux:nn.)
```

`__template_find_global:` Global assignments should have the phrase `global` at the front. This is pretty easy to find: no other error checking, though.

```

742 \cs_new_protected:Npn \__template_find_global:
743 {
744   \bool_set_false:N \l__template_global_bool
745   \tl_if_in:onT \l__template_var_tl { global }
746   {
747     \exp_after:wN \__template_find_global_aux:w \l__template_var_tl \s__template_stop
748   }
749 }
750 \cs_new_protected:Npn \__template_find_global_aux:w #1 global #2 \s__template_stop
751 {
752   \tl_set:Nn \l__template_var_tl {#2}
753   \bool_set_true:N \l__template_global_bool
754 }
```

(End of definition for `__template_find_global:` and `__template_find_global_aux:w`.)

11.9 Using templates directly

`__template_use_template:nnn` Directly use a template with a particular parameter setting. This is also picked up if used in a nested fashion inside a parameter list. The idea is essentially the same as creating an instance, just with no saving of the result.

```
755 \cs_new_protected:Npn \__template_use_template:nnn #1#2#3
```

```

756   {
757     \__template_execute_if_code_exist:nnT {#1} {#2}
758     {
759       \__template_recover_defaults:nn {#1} {#2}
760       \__template_recover_vars:nn {#1} {#2}
761       \__template_parse_values:nnn {#1} {#2} {#3}
762       \__template_convert_to_assignments:
763       \use:c { \c__template_code_root_tl #1 / #2 }
764     }
765   }

```

(End of definition for `__template_use_template:nnn`.)

11.10 Assigning values to variables

```
\__template_assign_boolean:
\__template_assign_boolean_aux:n
```

Setting a Boolean value is slightly different to everything else as the value can be used to work out which `set` function to call. As long as there is no need to recover things from another variable, everything is pretty easy. If there is, then we need to allow for the fact that the recovered value here will *not* be expandable, so needs to be converted to something that is.

```

766 \cs_new_protected:Npn \__template_assign_boolean:
767   {
768     \bool_if:NTF \l__template_global_bool
769     { \__template_assign_boolean_aux:n { bool_gset } }
770     { \__template_assign_boolean_aux:n { bool_set } }
771   }
772 \cs_new_protected:Npn \__template_assign_boolean_aux:n #1
773   {
774     \__template_if_key_value:VTF \l__template_value_tl
775     {
776       \__template_key_to_value:
777       \tl_put_right:Ne \l__template_assignments_tl
778       {
779         \exp_not:c { #1 _eq:NN }
780         \exp_not:V \l__template_var_tl

824     {
825         \cs_generate_from_arg_count>NNnn
826         \exp_not:V \l__template_var_tl
827         \exp_not:N #1
828         { \exp_not:V \l__template_keytype_arg_tl }
829         { \exp_not:V \l__template_value_tl }
830     }
831 }

```

(End of definition for __template_assign_function: and __template_assign_function_aux:N.)

__template_assign_instance: Using an instance means adding the appropriate function creation to the tl. No checks are made at this stage, so if the instance is not valid then errors will arise later.

```

832 \cs_new_protected:Npn \__template_assign_instance:
833 {
834     \bool_if:NTF \l__template_global_bool
835     { \__template_assign_instance_aux:N \cs_gset_protected:Npn }
836     { \__template_assign_instance_aux:N \cs_set_protected:Npn }
837 }
838 \cs_new_protected:Npn \__template_assign_instance_aux:N #1
839 {

```

```

840     \tl_put_right:Nne \l__template_assignments_tl
841     {
842         \exp_not:N #1 \exp_not:V \l__template_var_tl
843         {
844             \__template_use_instance:nn
845             { \exp_not:V \l__template_keytype_arg_tl }
846             { \exp_not:V \l__template_value_tl }
847         }
848     }
849 }
```

(End of definition for `__template_assign_instance:` and `__template_assign_instance_aux:N`.)

`__template_assign_variable:` `__template_assign_variable:n`: A general-purpose function for all of the other assignments. As long as the value is not coming from another variable, the stored value is simply transferred for output. We use V-type expansion for the `\KeyValue` case: for token lists this is essential, whilst for register-based variables, it does no harm and avoids needing a low-level test.

```

850 \cs_new_protected:Npn \__template_assign_variable:
851 {
852     \exp_args:Nne \__template_assign_variable:n
853     {
854         \__template_map_var_type:
855         -
856         \bool_if:NT \l__template_global_bool { g }
857         set:N
858     }
859 }
```

Notice we need a V-type variant for each (g)`set` operation here: these need to be provided by `expl3`.

```

860 \cs_new_protected:Npn \__template_assign_variable:n #1
861 {
862     \__template_if_key_value:VTF \l__template_value_tl
863     {
864         \__template_key_to_value:
865         \tl_put_right:Nne \l__template_assignments_tl
866         {
867             \exp_not:c { #1 V } \exp_not:V \l__template_var_tl
868             \exp_not:V \l__template_value_tl
869         }
870     }
871     {
872         \tl_put_right:Nne \l__template_assignments_tl
873         {
874             \exp_not:c { #1 n } \exp_not:V \l__template_var_tl
875             { \exp_not:V \l__template_value_tl }
876         }
877     }
878 }
```

(End of definition for `__template_assign_variable:` and `__template_assign_variable:n`.)

`__template_key_to_value:` `__template_key_to_value_auxi:w` `__template_key_to_value_auxii:w`: The idea here is to recover the attribute value of another key. To do that, the marker is removed and a look up takes place. If this is successful, then the name of the variable of the attribute is returned. This assumes that the value will be used in context where it

will be converted to a value, for example when setting a number. There is also a need to check in case the copied value happens to be *global*.

```

879 \cs_new_protected:Npn \__template_key_to_value:
880   { \exp_after:wN \__template_key_to_value_auxi:w \l__template_value_tl }
881 \cs_new_protected:Npn \__template_key_to_value_auxi:w \KeyValue #1
882   {
883     \tl_set:Ne \l__template_tmp_tl { \tl_trim_spaces:e { \tl_to_str:n {#1} } }
884     \prop_get:NVNTF \l__template_vars_prop \l__template_tmp_tl
885       \l__template_value_tl
886     {
887       \exp_after:wN \__template_key_to_value_auxii:w \l__template_value_tl
888         \s__template_mark global \q__template_nil \s__template_stop
889     }
890     { \msg_error:nnV { template } { unknown-attribute } \l__template_tmp_tl }
891   }
892 \cs_new_protected:Npn \__template_key_to_value_auxii:w #1 global #2#3 \s__template_stop
893   {
894     \__template_quark_if_nil:NF #2
895     { \tl_set:Nn \l__template_value_tl {#2} }
896   }

```

(End of definition for __template_key_to_value:, __template_key_to_value_auxi:w, and __template_key_to_value_auxii:w.)

11.11 Using instances

Using an instance is just a question of finding the appropriate function. If nothing is found, an error is raised. One complication is that if the first token of argument #2 is \UseTemplate then that is also valid. There is an error-test to make sure that the types agree, and if so the template is used directly.

```

897 \cs_new_protected:Npn \__template_use_instance:nn #1#2
898   {
899     \__template_if_use_template:nTF {#2}
900     { \__template_use_instance_aux:nNnn {#1} #2 }
901     { \__template_use_instance_aux:nn {#1} {#2} }
902   }
903 \cs_new_protected:Npn \__template_use_instance_aux:nNnn #1#2#3#4#5
904   {
905     \str_if_eq:nnTF {#1} {#3}
906     { \__template_use_template:nnn {#3} {#4} {#5} }
907     { \msg_error:nnnn { template } { type-mismatch } {#1} {#3} }
908   }
909 \cs_new_protected:Npn \__template_use_instance_aux:nn #1#2
910   {
911     \__template_if_instance_exist:nnTF {#1} {#2}
912     { \use:c { \c__template_instances_root_tl #1 / #2 } }
913     { \msg_error:nnnn { template } { unknown-instance } {#1} {#2} }
914   }

```

(End of definition for __template_use_instance:nn, __template_use_instance_aux:nNnn, and __template_use_instance_aux:nn.)

11.12 Assignment manipulation

A few functions to transfer assignments about, as this is needed by \AssignTemplateKeys.

```
\_\_template\_assignments\_pop: To actually use the assignments.  
915 \cs_new:Npn \_\_template\_assignments\_pop: { \l_\_template\_assignments_tl }
```

(End of definition for __template_assignments_pop::)

```
\_\_template\_assignments\_push:n Here, the assignments are stored for later use.
```

```
916 \cs_new_protected:Npn \_\_template\_assignments\_push:n #1  
917 { \tl_set:Nn \l_\_template\_assignments_tl {#1} }
```

(End of definition for __template_assignments_push:n.)

11.13 Showing templates and instances

```
\_\_template\_show\_code:nn Showing the code for a template is just a translation of \cs\_show:c.
```

```
918 \cs_new_protected:Npn \_\_template\_show\_code:nn #1#2  
919 { \cs_show:c { \c_\_template_code_root_tl #1 / #2 } }
```

(End of definition for __template_show_code:nn.)

```
\_\_template\_show\_defaults:nn \_\_template\_show\_keytypes:nn A modified version of the property-list printing code, such that the output refers to  
\_\_template\_show\_vars:nn templates and instances rather than to the underlying structures.
```

```
920 \cs_new_protected:Npn \_\_template\_show\_defaults:nn #1#2  
921 {  
922     \_\_template_if_keys_exist:nnT {#1} {#2}  
923     {  
924         \_\_template_recover_defaults:nn {#1} {#2}  
925         \_\_template_show:Nnnn \l_\_template_values_prop  
926         {#1} {#2} { default~values }  
927     }  
928 }  
929 \cs_new_protected:Npn \_\_template\_show\_keytypes:nn #1#2  
930 {  
931     \_\_template_if_keys_exist:nnT {#1} {#2}  
932     {  
933         \_\_template_recover_keytypes:nn {#1} {#2}  
934         \_\_template_show:Nnnn \l_\_template_keytypes_prop  
935         {#1} {#2} { interface }  
936     }  
937 }  
938 \cs_new_protected:Npn \_\_template\_show\_vars:nn #1#2  
939 {  
940     \_\_template_execute_if_code_exist:nnT {#1} {#2}  
941     {  
942         \_\_template_recover_vars:nn {#1} {#2}  
943         \_\_template_show:Nnnn \l_\_template_vars_prop  
944         {#1} {#2} { variable-mapping }  
945     }  
946 }  
947 \cs_new_protected:Npn \_\_template\_show:Nnnn #1#2#3#4  
948 {
```

```

949   \msg_show:nneeee { template } { show-attribute }
950   { \tl_to_str:n {#2} }
951   { \tl_to_str:n {#3} }
952   { \tl_to_str:n {#4} }
953   { \prop_map_function:NN #1 \msg_show_item_unbraced:nn }
954 }

```

(End of definition for `_template_show_defaults:nn` and others.)

`_template_show_values:nn` Instance values are a little more complex, as is the template to consider.

```

955 \cs_new_protected:Npn \_template_show_values:nn #1#2
956 {
957   \_template_if_instance_exist:nnT {#1} {#2}
958   {
959     \_template_recover_values:nn {#1} {#2}
960     \msg_show:nneeee { template } { show-values }
961     { \tl_to_str:n {#1} }
962     { \tl_to_str:n {#2} }
963     {
964       \prop_map_function:NN \l__template_values_prop
965       \msg_show_item_unbraced:nn
966     }
967   }
968 }

```

(End of definition for `_template_show_values:nn`.)

1 Counters

This section deals with counter and other variable allocation.

1 {*2ekernel}

The following are from plain T_EX:

\z@ A zero dimen or number. It's more efficient to write \parindent\z@ than \parindent 0pt.

\@ne The number 1.

\m@ne The number -1.

\tw@ The number 2.

\sixt@@n The number 16.

\@m The number 1000.

\@MM The number 20000.

\@xxxii The constant 32.

2 \chardef\@xxxii=32

(End of definition for \@xxxii.)

\@Mi Constants 10001–10004.

\@Mii 3 \mathchardef\@Mi=10001

\@Miii 4 \mathchardef\@Mii=10002

\@Miv 5 \mathchardef\@Miii=10003

6 \mathchardef\@Miv=10004

(End of definition for \@Mi and others.)

\@tempcnta Scratch count registers used by L^AT_EX kernel commands.

\@tempcntb 7 \newcount\@tempcnta

8 \newcount\@tempcntb

(End of definition for \@tempcnta and \@tempcntb.)

\if@tempswa General boolean switch used by L^AT_EX kernel commands.

9 \newif\if@tempswa

(End of definition for \if@tempswa.)

\@tempdima Scratch dimen registers used by L^AT_EX kernel commands.

\@tempdimb 10 \newdimen\@tempdima

\@tempdimc 11 \newdimen\@tempdimb

12 \newdimen\@tempdimc

(End of definition for \@tempdima, \@tempdimb, and \@tempdimc.)

\@tempboxa Scratch box register used by L^AT_EX kernel commands.
 ¹³ \newbox\@tempboxa
 (End of definition for \@tempboxa.)

\@tempskipa Scratch skip registers used by L^AT_EX kernel commands.
 \@tempskipb
 ¹⁴ \newskip\@tempskipa
 ¹⁵ \newskip\@tempskipb
 (End of definition for \@tempskipa and \@tempskipb.)

\@temptokena Scratch token register used by L^AT_EX kernel commands.
 ¹⁶ \newtoks\@temptokena
 (End of definition for \@temptokena.)

\@flushglue Glue used for \right- & \leftskip = 0pt plus 1fil
 ¹⁷ \newskip\@flushglue \@flushglue = 0pt plus 1fil
 (End of definition for \@flushglue.)

1 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
1  {*2ekernel}
2  \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
    while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
    while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to A1,A2,
... ,An .
    Executes BODY n times, with NAME = Ai on the i-th iteration.
    Optimized for the normal case of n = 1. Works for n=0.

\@tfour NAME := LIST \do {BODY}
    if, before expansion, LIST = T1 ... Tn where each Ti is a
    token or {...}, then executes BODY n times, with NAME = Ti
    on the i-th iteration. Works for n=0.
```

NOTES: 1. These macros use no `\@temp` sequences.
2. These macros do not work if the body contains anything that looks syntactically to TeX like an improperly balanced `\if` `\else` `\fi`.

```
\@whilenum TEST \do {BODY} ==
BEGIN
  if TEST
  then BODY
    \@iwhilenum{TEST \relax BODY}
END

\@iwhilenum {TEST BODY} ==
BEGIN
  if TEST

lterror.dtx

1 Error handling and tracing

This section defines L^AT_EX's error commands.

```
1 (*2ekernel)
```

The ‘2ekernel’ code ensures that a \usepackage{autoerr} is essentially ignored if a ‘full’ format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

```
2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion
```

1.1 General commands

\MessageBreak This command prints a new-line inside a message, followed by a continuation line begun with \cmsg@continuation. Normally it is defined to be \relax, but inside messages, it is let to \message@break.

```
3 \let\MessageBreak\relax
```

(End of definition for \MessageBreak.)

\GenericInfo This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5   \begingroup
6     \def\MessageBreak{^^J#1}%
7     \set@display@protect
8     \immediate\write\m@ne{#2\on@line.}%
9   \endgroup
10 }
```

(End of definition for \GenericInfo.)

\GenericWarning This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12   \begingroup
13     \def\MessageBreak{^^J#1}%
14     \set@display@protect
15     \immediate\write\@unused{^^J#2\on@line.^^J}%
16   \endgroup
17 }
```

(End of definition for \GenericWarning.)

- \GenericError This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing `h` to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```

18 \bgroup
19 \lccode`@`\ %
20 \lccode`~-`\ %
21 \lccode`\}=`\ %
22 \lccode`\{`\ %
23 \lccode`\T`\T%
24 \lccode`\H`\H%
25 \catcode`\\=11\relax%
26 \lowercase{%
27 \egroup%

```

Unfortunately TeX versions older than 3.141 have a bug which means that `^^J` does not force a linebreak in `\message` and `\errmessage` commands. So for these old TeX's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

To appear on the terminal, but if you do not like it, you can always upgrade your TeX! In order for your format to use this version, you must define the macro `\@TeXversion` to be the version number, e.g., 3.14 of the underlying TeX. See the comments in `ltdircheck.dtx`.

```

28 \dimen@\ifx\@TeXversion\undefined4\else\@TeXversion\fi\p@%
29 \ifdim\dimen@>3.14\p@%

```

First the ‘standard case’.

```

30 \DeclareRobustCommand{\GenericError}[4]{%
31 \begingroup%
32 \immediate\write\@unused{}}%

80 {}}%
81 ~%
82 \endgroup}%
83 \fi}%

```

(End of definition for \GenericError.)

```

\PackageError
\PackageWarning
\PackageWarningNoLine
  \PackageInfo
  \ClassError
  \ClassWarning
\ClassWarningNoLine
  \ClassInfo

```

These commands are intended for use by package and class writers, to give information to authors. The syntax is:

```

\PackageError{<package>}{<error>}{<help>}
\PackageWarning{<package>}{<warning>}
\PackageWarningNoLine{<package>}{<warning>}
\PackageInfo{<package>}{<info>}

```

and similarly for classes. The **Error** commands print the **<error>** message, and present the interactive prompt; if the author types **h**, then the **<help>** information is displayed. The **Warning** commands produce a warning but do not present the interactive prompt. The **WarningNoLine** commands do the same, but don't print the input line number. The **Info** commands write the message to the **log** file. Within the messages, the command **\MessageBreak** can be used to break a line, **\protect** can be used to protect command names, and **\space** is a space, for example:

```
\newcommand{\foo}{FOO}
\PackageWarning{ethel}{%
    Your hovercraft is full of eels,\MessageBreak
    and \protect\foo\space is \foo}
```

produces:

```
Package ethel warning: Your hovercraft is full of eels,
(ethel)                                and \foo is FOO on input line 54.

```
258 \gdef\@badtab{%
259 \@latex@error{Undefined tab position}\@ehd}
```

(End of definition for \@badtab.)

\@preamerr This error is special: it appears in places where we normally have to \protect expansions. However, to prevent a protection of the error message itself (which would result in the message getting printed not issued on the terminal) we need to locally reset \protect to \relax.

```
260 \gdef\@preamerr#1{%
261 \begingroup
262 \let\protect\relax
263 \@latex@error{\ifcase #1 Illegal character\or
264 Missing @-exp\or Missing p-arg\fi\space
265 in array arg}\@ehd
266 \endgroup}
```

(End of definition for \@preamerr.)

**\@badlinearg** Occurs in `\line` and `\vector` command when a bad slope argument is encountered.

```
267 \gdef\@badlinearg{%
268 \@latex@error{%
269 Bad \protect\line\space or \protect\vector
270 \space argument}\@ehb}
```

(End of definition for `\@badlinearg`.)

**\@LRmoderr** A command is not allowed in restricted horizontal mode, i.e., in LR-mode in L<sup>A</sup>T<sub>E</sub>X terminology.

```
271 \gdef\@LRmoderr{%
272 \@latex@error{Not allowed in LR mode}\@ehb}
```

(End of definition for `\@LRmoderr`.)

**\@parmoderr** Occurs in a float environment or a `\marginpar` when encountered in inner vertical mode.

```
273 \gdef\@parmoderr{%
274 \@latex@error{Not in outer par mode}\@ehb}
```

(End of definition for `\@parmoderr`.)

**\@fltovf** Occurs in float environment or `\marginpar` when there are no more free boxes for storing floats.

```
275 \gdef\@fltovf{%
276 \@latex@error{Too many unprocessed floats}\@ehb}
```

(End of definition for `\@fltovf`.)

**\@latexbug** Occurs in output routine. This is bad news.

```
277 \gdef\@latexbug{%
278 \@latex@error{This may be a LaTeX bug}{Call for help}}
```

(End of definition for `\@latexbug`.)

**\@badcrerr** This error was removed and replaced by `\@nolnerr`.

```
279 \%def\@badcrerr {\@latex@error{Bad use of \protect\\}\@ehc}
```

(End of definition for `\@badcrerr`.)

**\@noitemerr** `\addvspace` or `\addpenalty` was called when not in vmode. Probably caused by a missing `\item`.

```
280 \gdef\@noitemerr{%
281 \@latex@error{Something's wrong--perhaps a missing %
282 \protect\item}\@ehc}
```

(End of definition for `\@noitemerr`.)

**\@notprerr** A command that can be used only in the preamble appears after the command `\begin{document}`.

```
283 \gdef\@notprerr{%
284 \@latex@error{Can be used only in preamble}\@eha}
```

(End of definition for `\@notprerr`.)

\@inmatherr Issued by commands that don't work correctly within math (like `\item`). There is no real error recovery happening, e.g., the user might get additional errors afterwards.

```
285 \gdef\@inmatherr#1{%
286 \relax
287 \ifmmode
288 \@latex@error{Command \protect#1 invalid in math mode}\@ehc
289 \fi}
```

(End of definition for `\@inmatherr`.)

\@invalidchar An error for use with invalid characters. This is commented out, since we decided to use catcode 15 instead.

```
290 %\def\@invalidchar{\@latex@error{Invalid character in input}\@ehc}
```

(End of definition for `\@invalidchar`.)

As well as the above error commands some error messages are directly coded to save space. The messages already present in L<sup>A</sup>T<sub>E</sub>X2.09 include:

Environment --- undefined

Issued by `\begin` for undefined environment.

Tab overflow

Occurs in `\=` when maximum number of tabs exceeded.

\< in mid line

Occurs in `\<` when it appears in middle of line.

Float(s) lost

In output routine, caused by a float environment or `\marginpar` occurring in inner vertical mode.

### 1.3 Tracing

The `trace` package implements the commands `\traceon` and `\traceoff` that work similar to `\tracingall` but skip certain code blocks that produce a lot of tracing output being of no interest during debugging (for example loading a font). Code blocks that should be hidden during tracing need to be surrounded by the macros `\conditionally@traceoff` and `\conditionally@traceon`.

For the kernel code the `trace` package then redefines a number of macros to include this tracing support.

However, in order to allow any macro package to react to `\traceon` we also provide dummy definitions for the two commands in the kernel so that they can be used by external packages without the need to distinguish between `trace` being loaded or not.

\conditionally@traceon These are only dummy definitions. For details see the `trace` package.

```
291 \let\conditionally@traceon\@empty
292 \let\conditionally@traceoff\@empty
```

(End of definition for `\conditionally@traceon` and `\conditionally@traceoff`.)

```
293 </2ekernel>
```

# File 15

## ltpar.dtx

### 1 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` whenever their function needs to be changed for a long time.

This file here describes the interfaces that have been in the kernel forever, used to implement the scenarios described below. They remain valid but are now augmented in the next file (`ltpara.dtx`) to add hooks to paragraphs. At some point we will consolidate the two files further.

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
  - All list environments (itemize, quote, etc.)
  - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
  - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
  - The mechanism for avoiding page breaks and getting the spacing right after section heads.

#### 1.1 Implementation

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{\langle VAL \rangle}` command. Its function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `\langle VAL \rangle`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@@par` `\@@par` always is defined to be the original TeX `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

- Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace where `\everypar` has been redefined). Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.
- Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```

1 {*2ekernel}
2 \message{par ,}

```

`\@setpar` Initiate a long-term change to `\par`.  
`\@par` `\def\@setpar#1{\def\par{\#1}\def\@par{\#1}}`

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@@par` after one iteration.

```

4 \def\@par{\let\par\@@par\par}

```

(End of definition for `\@setpar` and `\@par`.)

`\@restorepar` Restore from a short-term change to `\par`.

```

5 \def\@restorepar{\def\par{\@par}}
6 {/2ekernel}

```

(End of definition for `\@restorepar`.)

# File 16

## ltpara.dtx

### Abstract

This code defines four special kernel hooks to support paragraph tagging as well as four public hooks which can be occasionally useful.

## 1 Introduction

The building of paragraphs in the T<sub>E</sub>X engine(s) has a number of peculiarities that makes it on one hand fairly flexible but on the other hand somewhat awkward to control or reliably to extend. Thus to better understand the code below we start with a brief introduction of the mechanism; for more details refer to the T<sub>E</sub>Xbook [?, chap. 14] (for the full truth you may even have to study the program code).

### 1.1 The default processing done by the engine

T<sub>E</sub>X automatically starts building a paragraph when it is currently in vertical mode and encounters anything that can only live in horizontal mode. Most often this is a character, but there are also many commands that can be used only in horizontal mode. If any of them is encountered, T<sub>E</sub>X will immediately back up (i.e., the character or command is read later again), adds a `\parskip` glue to the current vertical list unless the list is empty, switches to horizontal mode, starts its special “start of paragraph processing” and only then rereads the character or command that caused the mode change.<sup>24</sup>

This “start of paragraph processing” first adds an empty box at the start of the horizontal list of width `\parindent` (which represents the paragraph indentation) unless the paragraph was started with `\noindent` in which case no such box is added<sup>25</sup>. It then reads and processes all tokens stored in the special engine token register `\everypar`. After that it reads and processes whatever has caused the paragraph to start.

Thus out of the box, T<sub>E</sub>X offers the possibility to put some special code into `\everypar` to gain control at (more or less) the start of the paragraph. For example, in La<sub>T</sub>e<sub>X</sub> and a number of packages, special code like the following is sometimes used:

```
\everypar{{\setbox\z@\lastbox}\everypar{} ...}
```

This removes the paragraph indentation box again (that was already placed by T<sub>E</sub>X), then resets `\everypar` so that it doesn’t do anything on the next paragraph start and then does whatever it wants to do, e.g., in an `\item` of a list it will typeset the label in front of the paragraph text. However, there is only one such `\everypar` token register and if different packages and/or the kernel all attempt to add their own code here, coordination is very difficult if not impossible.

The process when the paragraph ends has different mechanisms and interfaces. A paragraph ends when the engine primitive `\par` is called while T<sub>E</sub>X is in unrestricted horizontal mode, i.e., is building a paragraph. At other times this primitive does nothing or generates as an error depending on the mode T<sub>E</sub>X is in, e.g., the `\par` in `\hbox{a\par b}` is ignored, but `$a\par b$` would complain.

<sup>24</sup>Already not quite true: the command `\noindent` starts the paragraph but influences the special processing by suppressing the paragraph indentation box normally inserted by it.

<sup>25</sup>That’s a bit different from placing a zero-sized box!

If this primitive ends the paragraph it does some special “end of horizontal list” processing, then calls  $\TeX$ ’s paragraph builder; this breaks the horizontal list into lines and then these lines are added as boxes to the enclosing vertical list and  $\TeX$  returns to vertical mode.

This  $\par$  command can be given explicitly, but there are also situations in which  $\TeX$  is generating it on the fly. Most often this happens when  $\TeX$  encounters a blank line which is automatically changed to a  $\par$  command which is then executed. The other possibility is that  $\TeX$  encounters a command which is incompatible with horizontal processing, e.g.,  $\vskip$  (a request for adding vertical space). In such cases it silently backs up, and inserts a  $\par$  in the hope that this gets it out of horizontal mode and makes the vertical command acceptable.

The important point to note here is that  $\TeX$  really inserts the command with the name  $\par$ , which can be redefined. Thus, it may not have its original “primitive” meaning and therefore may not end the horizontal list and call the paragraph builder. This approach offers some flexibility but also allows you to easily produce a  $\TeX$  document that loops forever, for example, the simple line

```
A \let\par\relax \vskip
```

will start a horizontal list at A, redefines  $\par$ , then sees  $\vskip$  and inserts  $\par$  to end the paragraph. But this now only runs  $\relax$  so nothing changes and  $\vskip$  is read again, issues a  $\par$  which .... In short, it only takes a plain  $\TeX$  document with five tokens to run forever (since no memory is consumed and therefore eventually exhausted).

There is no way other than changing  $\par$  to gain control at the end of a paragraph, i.e., there is no token list like  $\everypar$  that is inserted. Hence the only way to change the default behavior is to modify the action that  $\par$  executes, with similar issues as outlined before: different processes need to ensure that they do not overwrite their modifications or worse, think that the  $\par$  in front of them is the engine primitive while in fact it has already been changed by other code.

To make matters slightly worse there are a few places where  $\TeX$  handles the situation differently (most likely for speed reasons back when computers were much slower). If  $\TeX$  finds itself in unrestricted horizontal mode at the end of building a vertical box (for an  $\insert$ ,  $\vadjust$  or executing the output routine code), it will finish the horizontal list not by issuing a  $\par$  command (which would be consistent with all other places) but by simply executing the primitive meaning of  $\par$ , regardless of the actual definition that  $\par$  has at the time.

Thus, if you have carefully crafted a redefined  $\par$  to execute some special actions at the end of a paragraph and you write something like

```
\vbox{Some paragraph ... text.}
```

you will find that your code does not get run for the last paragraph in that box.  $\LaTeX$  avoids this problem, by making sure that its boxes (such as  $\parbox$  or the  $\minipage$  environment, etc.) all internally add an explicit  $\par$  at the end so that such code is run and  $\TeX$  finds itself in vertical mode already without the need to start up the paragraph builder internally. But, of course, this only works for boxes under direct control of the  $\LaTeX$  kernel; if some package uses low-level  $\vbox$ es without adding this precaution the  $\TeX$  optimization kicks in and no special  $\par$  code is executed.

And there is another optimization that is painful: if a paragraph is interrupted by a mathematical display, e.g.,  $\[...]$  in  $\LaTeX$  or  $$$...$$$  in plain  $\TeX$ , then  $\TeX$  will resume horizontal mode afterward, i.e., it will start to build a new horizontal list

without inserting an indentation box or `\everypar` at that point. However, if that list immediately ends with an explicit or implicit `\par` then `TeX` will simply throw away this “null” paragraph and not do its usual “end of horizontal list” processing, so this special case also needs to be accounted for when introducing any extended processing.

## 2 The new mechanism implemented for `LATEX`

To improve the situation (and also to support automatic tagging of PDF documents) we now offer public as well as private hooks at the start and end of the paragraph processing. The public hooks can be used by packages (or by the user in the preamble or within the document) and using the hook mechanisms it is possible to reorder or arrange code from different packages in such a way that these can safely coexist.

To make that happen we have to make use of the basic functionality that is offered by `TeX`, e.g., we install special code inside `\everypar` to provide hooks at the beginning and we redefine `\par` to do some special processing when appropriate to install hooks at the end of the paragraph.

In order to make this work, we have to ensure that package use of `\everypar` is not overwriting our code. This is done through a trick: we basically hide the real `\everypar` from the packages and offer them a new token register (with the same name). So if they install their own code it doesn’t overwrite ours. Our code then inserts the new `\everypar` at the right place inside the process so that it looks as if it was the primitive `\everypar`.<sup>26</sup>

At the end of the paragraph it would be great if we could use a similar trick. However, due to the fact that `TeX` inserts the token `\par` (that doesn’t have a defined meaning) we can’t hide “the real thing™” and offer the package an indistinguishable alternate.

Fortunately, `LATEX` has already redefined `\par` for its own purposes. As a result there aren’t many packages that attempt to change `\par`, because without a lot of extra care that would fail miserably. But the bottom line is that, if you load a package that alters `\par` then the end of paragraph hooks are most likely not executing while that redefinition is active.<sup>27</sup>

---

<sup>26</sup>Ideally, `\everypar` wouldn’t be used at all by packages and instead they would simply write their code into the hooks now offered by the kernel. However, while this is the longterm goal and clearly an improvement (because then the packages do no longer need to worry about getting their code overwritten or needing to account for already existing code in `\everypar`), this will not happen overnight. For that reason support for this legacy method is retained.

<sup>27</sup>Similarly to the `\everypar` situation, the remedy is that such packages stop doing this and instead add their alterations into the paragraph hooks now provided.

## 2.1 The provided hooks

---

**para/before**

**para/begin**

**para/end**

**para/after**

---

The following four public hooks are defined and executed for each paragraph:

**para/before** This hook is executed after the kernel hook `\@kernel@before@para@before` (discussed below) in vertical mode immediately after `TEX` has contributed `\parskip` to the vertical list and before the actual paragraph processing in horizontal mode starts.

This hook should either not produce any typeset material or add only vertical material. If it starts a paragraph an error is generated. The reason is that we are in the starting process of processing a paragraph and so this would lead to endless recursion.<sup>28</sup>

**para/begin** This hook is executed after the kernel hook `\@kernel@before@para@begin` (discussed below) in horizontal mode immediately before the indentation box is placed (if there is any, i.e., if the paragraph hasn't been started with `\noindent`).

The indentation box to be typeset is available to the hook as `\IndentBox` and its automatic placement (after the hook is executed) can be prevented through `\OmitIndent`. More precisely `\OmitIndent` voids the box.

The indentation box is then typeset directly after the hook execution by something equivalent to `\box\IndentBox` followed by the current content of the token register `\everypar` that it is available to the kernel or to packages (that run some legacy code).

One has to be careful not to add any code to the hook that starts its own paragraph (e.g., by adding a `\parbox` or a `\marginpar` inside) because that would call the hook inside again (as a new paragraph is started there) and thus lead to an endless recursion ending only after exhausting the available memory. This can only be done by making sure that is not executed for the inner paragraphs (or at least not recursively forever).

**para/end** This hook is executed at the end of a paragraph when `TEX` is ready to return to vertical mode and after it has removed the last horizontal glue (but not any kerns) placed on the horizontal list. The code is still executed in horizontal mode so it is possible to add further horizontal material at this point, but it should not alter the mode (even a temporary exit from horizontal mode would create chaos—any attempt will cause an error message)! After the hook has ended the kernel hook `\@kernel@after@para@end` is executed and then `TEX` returns to vertical mode.

The hook is offered as public hook, but because of the requirement to stay within horizontal mode one needs to be careful in what is placed into the hook.<sup>29</sup>

This hook is implemented as a reversed hook.

**para/after** This hook is executed directly after `TEX` has returned to vertical mode and after any material that migrated out of the horizontal list (e.g., from a `\vadjust`) has processed.

---

<sup>28</sup>One could allow it but only if the newly started paragraph is processed without any hooks. Furthermore correct spacing would be a bit of a nightmare so for now this is forbidden.

<sup>29</sup>Maybe we should guard against that, but it would be rather tricky to implement as mode changes can happen across group boundaries so one would need to keep a private stack just for that. Well, something to ponder.

This hook should either not produce any typeset material or add only vertical material. However, for this hook starting a new paragraph is not a disaster so that it isn't prevented.

This hook is implemented as a reversed hook.

Once that hook code has been processed the kernel hook `\@kernel@after@para@after` is executed as the final action of the paragraph processing.

---

```
\@kernel@before@para@before
\@kernel@after@para@after
\@kernel@before@para@begin
\@kernel@after@para@end
```

---

As already mentioned above there are also four kernel hooks that are executed at the start and end of the processing.

`\@kernel@before@para@before` For future extensions, not currently used by the kernel.

`\@kernel@after@para@after` For future extensions, not currently used by the kernel.

`\@kernel@before@para@begin` Used by the kernel to implement tagging. This hook is executed at the very beginning of a paragraph after TeX has switched to horizontal mode but before any indentation box got added or any `\everypar` was run.

It should not generate typeset material that could alter the position. Note that it should never leave hmode, otherwise you will end with a loop! We could guard against this, but since it is an internal kernel hook that shouldn't be touched this isn't checked.

`\@kernel@after@para@end` Used by the kernel to implement tagging. It is executed directly after the public `para/end` hook. After it there is a quick check that we are still in horizontal mode, i.e., that the public hook has not mistakenly ended horizontal mode prematurely (this is an incomplete check just testing the mode and could perhaps be improved (at the cost of speed)).

## 2.2 Altered and newly provided commands

---

`\par`  
`\endgraf`  
`\para_end:`

An explicit request for ending a paragraph is provided in plain TeX under the name `\endgraf`, which simply uses the primitive meaning (regardless of what `\par` may have as its current definition). In L<sup>A</sup>T<sub>E</sub>X `\endgraf` (with that behavior) was originally also available.

With the new paragraph handling in L<sup>A</sup>T<sub>E</sub>X, ending a paragraph means a bit more than just calling the engine's paragraph builder: the process also has to add any hook code for the end of a paragraph. Thus `\endgraf` was changed to provide this additional functionality (along with `\par` remaining subject to its current meaning).

The expl3 name for this functionality is `\para_end:`.

**Note:** *The next two commands are still under discussion and may slightly change their semantics (as described in the document) and/or their names between now and the 2021 Spring release!*

---

`\OmitIndent`  
`\para omit indent:`

Inside the `para/begin` hook one can use this command to suppress the indentation box at the start of the paragraph. (Technically it is possible to use this command outside the hook as well, but this should not be relied upon.) The box itself remains available for use.

The `expl3` name for the function is `\para omit indent:`.

---

`\IndentBox`  
`\g para indent box`

The box register holding the indentation box for the paragraph is available for inspection (or changes) inside hooks. It remains available even if the `\OmitIndent` command was used; in that case it will just not be automatically placed.

The `expl3` name for the box register is `\g para indent box`.

---

`\RawIndent`  
`\para raw indent:`  
`\RawNoindent`  
`\para raw noindent:`  
`\RawParEnd`  
`\para raw end:`

```
\RawIndent hmode material \RawParEnd
\RawNoindent hmode material \RawParEnd
```

The commands `\RawIndent` and `\RawNoindent` are not meant for normal paragraph building (where the result is a textual paragraph in the traditional meaning of the word), but for special cases where `TeX`'s low-level algorithm is used to achieve special effects, but where the result is not a “paragraph”.

They are called “raw”, because they bypass `LATEX`'s hook mechanism for paragraphs and simply invoke the low-level `TeX` algorithm. I.e., they are like the original `TeX` primitives `\indent` and `\noindent` (that is they execute no hooks other than `\everypar`) except that they can only be used in vertical mode and generate an error if found elsewhere.

To avoid issues a paragraph started by them should always be ended by `\RawParEnd`<sup>30</sup> and not by `\par` (or a blank line), because the latter will execute hooks which then have no counterpart at the beginning of the paragraph. It is the responsibility of the programmer to make sure that they are properly paired. This also means that one should not put arbitrary user content between these commands if that content could contain stray `\pars`.

The `expl3` names for the functions are `\para raw indent:`, `\para raw indent:` and `\para raw end:`.

## 2.3 Examples

None of the examples in this section are meant for real use as they are far too simple-minded but they should give some ideas of what could be possible if a bit more care is applied.

### 2.3.1 Testing the mechanism

The idea is to output for each paragraph encountered some information: a paragraph sequence number, a level number in roman numerals, the environment in which this paragraph appears, and the line number where the start or end of the paragraph is, e.g., something like

---

<sup>30</sup>Technical note for those who know their `TeXbook`: the `\RawParEnd` command invokes the original `TeX` engine definition of `\par` that (solely) triggers the paragraph builder in `TeX` when found inside unrestricted horizontal mode and does nothing in other processing modes.

```

PARA: 1-i start (document env. on input line 38)
PARA: 1-i end (document env. on input line 38)
PARA: 2-i start (document env. on input line 40)
PARA: 3-ii start (minipage env. on input line 40)
PARA: 3-ii end (minipage env. on input line 40)
PARA: 2-i end (document env. on input line 41)

```

As you can see paragraph 2 starts on line 40 and ends on 41 and inside a minipage started paragraph 3 (start and end on line 40). If you run this on some document you will find that L<sup>A</sup>T<sub>E</sub>X considers more things “a paragraph” than you have probably thought.

This was generated by the following hook code:

```

\newcounter{paracnt} % sequence counter
\newcounter{paralevel} % level counter

```

To support paragraph nesting we need to maintain a stack of the sequence numbers. This is most easily done using `expl3` functions, so we switch over. This is not a very general implementation, just enough for what we need and a bit of L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  thrown in as well. When popping, the result gets stored in `\paracntvalue` and the `\ERROR` should never happen because it means we have tried to pop from an empty stack.

```

\ExplSyntaxOn
\seq_new:N \g_para_seq
\cs_new:Npn \ParaPush
 {\seq_gpush:No \g_para_seq {\the\value{paracnt}}}
\cs_new:Npn \ParaPop {\seq_gpop:NNF \g_para_seq \paracntvalue \ERROR }
\ExplSyntaxOff

```

At the start of the paragraph increment both sequence counter and level and also save the then current sequence number on our stack.

```

\makeatletter % because we use a few internal 2e commands
\AddToHook{para/begin}{%
 \stepcounter{paracnt}\stepcounter{paralevel}%
 \ParaPush
}

```

To display the sequence number we `\typeout` the current sequence and level number. The command `\@currenvir` gives us the current environment and `\on@line` produces a space and the current input line number.

```

\typeout{PARA: \arabic{paracnt}-\roman{paralevel} start
(\@currenvir\space env.\on@line)}%

```

We also typeset the sequence number as a tiny red number in a box that takes up no horizontal space. This helps us seeing where L<sup>A</sup>T<sub>E</sub>X sees the start and end of the paragraphs in the document.

```

\llap{\color{red}\tiny\arabic{paracnt}\ }%
}

```

At the end of the paragraph we display sequence number and level again. The level counter has the correct value but we need to retrieve the right sequence value by popping it off the stack after which it is available in `\paracntvalue` the way we have set this up above.

```
\AddToHook{para/end}{%
 \ParaPop
 \typeout{PARA: \paracntvalue-\roman{paralevel} end \space\space
 (@currenvir\space env.\on@line)}%
```

We also typeset again a tiny red number with that value, this time sticking out to the right.<sup>31</sup> We also decrement the level counter since our level has finished.

```
\rlap{\color{red}\tiny\ \paracntvalue}%
\addtocounter{paralevel}{-1}%
}
\makeatother
```

### 2.3.2 Mark the first paragraph of each `itemize`

The code for this is rather simple. We supply some code that is executed only once inside a hook at the start of each `itemize`. We explicitly change the color back and forth so that we don't introduce grouping around the paragraph.

```
\AddToHook{env/itemize/begin}{%
 \AddToHookNext{para/begin}{\color{blue}}%
 \AddToHookNext{para/end}{\color{black}}%
}
```

As a result the first paragraph of each `itemize` will appear in blue.

## 2.4 Some technical notes

The code tries hard to be transparent for package code, but of course any change means that there is a potential for breaking other code. So in section we collect a few cases that may be of importance if low-level code is dealing with paragraphs that are now behaving slightly differently. The notes are from issues we observed and will probably grow over time.

### 2.4.1 Glue items between paragraphs (found with `fancypar`)

In the past L<sup>A</sup>T<sub>E</sub>X placed two glue items between two consecutive paragraphs, e.g.,

```
text1 \par text2 \par
```

would show something like

```
\glue(\parskip) 0.0 plus 1.0
\glue(\baselineskip) 5.16669
```

but now there is another `\parskip` glue (that is always 0pt):

```
\glue(\parskip) 0.0 plus 1.0
\glue(\parskip) 0.0
\glue(\baselineskip) 5.16669
```

---

<sup>31</sup>Note that this can alter the document pagination, because a paragraph ending in a display (e.g., an equation) will get an extra line—in that case our tiny number has an effect even though it doesn't take up any space, because it paragraph is no longer empty and thus isn't dropped!

The reason is that we generate a “fake” paragraph to gain control and safely add the early hooks, but this generates an additional glue item. That item doesn’t contribute anything vertically but if somebody writes code that unravels a constructed list using `\lastbox`, `\unskip` and `\unpenalty` then the code has to remove one additional glue item or else it will fail.

### 3 The Implementation

```

1 <@=para>
2 <*ekernel | latexrelease>
3 \ExplSyntaxOn
4 <latexrelease> \NewModuleRelease{2021/06/01}{ltpara}
5 <latexrelease> {Paragraph-handling-and-hooks}

```

#### 3.1 Providing hooks for paragraphs

`para/before`

`para/after`

`para/begin`

`para/end`

The public hooks. They are implemented as a paired set of hooks.

```

6 \hook_new_pair:nn{para/before}{para/after}
7 \hook_new_pair:nn{para/begin}{para/end}

```

(End of definition for `para/before` and others. These functions are documented on page 413.)

`\@kernel@before@para@before`

`\@kernel@after@para@after`

`\@kernel@before@para@begin`

`\@kernel@after@para@end`

The corresponding kernel hooks (for tagging and future extensions).

```

8 \let \@kernel@before@para@before \empty
9 \let \@kernel@before@para@begin \empty
10 \let \@kernel@after@para@end \empty
11 \let \@kernel@after@para@after \empty

```

(End of definition for `\@kernel@before@para@before` and others. These functions are documented on page 414.)

`\g_para_standard_everypar_t1`

Whenever TeX starts a paragraph it inserts first an indentation box and then executes the tokens stored in `\tex_everypar:D` (known to L<sup>A</sup>T<sub>E</sub>X as `\everypar`). We alter this behavior slightly here, so that hooks are added into the right place. Otherwise the process change remains transparent to any legacy code for this space.

We keep the standard code to be used by `\tex_everypar:D` in a separate token list because we have to switch back and forth for error recovery and so altering `\tex_everypar:D` all the time should be a tiny bit faster.

```

12 <latexrelease> \IncludeInRelease{2023/06/01}
13 <latexrelease> {\g_para_standard_everypar_t1}{minipage- fix}
14 \tl_new:N \g_para_standard_everypar_t1

```

Here is now its definition:

```
15 \tl_gset:Nn \g_para_standard_everypar_t1 {
```

First we remove the indentation box and store it in `\g_para_indent_box`. If there was none because the paragraph was started by `\noindent` the box register will be void.

```
16 \box_gset_to_last:N \g_para_indent_box
```

This will make the newly started horizontal list empty, so if we stop it now and return to vertical mode it will be dropped by TeX. We do that but inside a group so that any `\parshape` settings will not get lost as we need them for later.

```

17 \group_begin:
18 \tex_par:D
19 \group_end:

```

We then change `\tex_everypar:D` to generate an error so that we can detect and report if the `para/before` hook illegally changed out of vmode.

```
20 \tex_everypar:D { \msg_error:nnn { hooks }{ para-mode }{before}{vertical} }
21 \@kernel@before@para@before
22 \hook_use:n {para/before}
```

Assuming the hooks have been well behaved it is time to return to horizontal mode and start the paragraph in earnest. We already have the indentation box saved away so we now have to restart the paragraph with an empty `\tex_everypar:D` and with `\tex_noindent:D`. And we need to make sure not to get another `\parskip` or rather (since we can't prevent that) that it is of zero size.

```
23 \group_begin:
24 \tex_everypar:D {}
```

There has been a long-standing problem with L<sup>A</sup>T<sub>E</sub>X's minipages in that invisible material at the beginning of a minipage (such as a `\color` setting) would result in `\parskip` being added in front of the first paragraph—something that is not done by T<sub>E</sub>X if a vertical list is completely empty. As this is happening on a very low-level in the engine it wasn't really possible to find out if this `\parskip` was added or if a space we see in front of the current point is legitimate. However, with the new paragraph handling we are in a better position: while we still don't know if there is such a space or not, we do know if we have just created an empty paragraph. Thus, if we now set `\parskip` to `-\parskip` the two will cancel each other if present and if the first was ignored because the vertical list was empty, then the second will be ignored too because it is still empty. Of course, we don't want to cancel always but only at the start of a minipage and that is signaled with the `@minipage` switch.

```
25 \skip_set:Nn \tex_parskip:D
26 { \if@minipage -\tex_parskip:D \else: \c_zero_skip \fi: }
27 \tex_noindent:D
28 \group_end:
```

That brings us back to the start of the horizontal list but we need to change `\tex_everypar:D` back to its normal content in case there are nested paragraphs coming up.

```
29 \tex_everypar:D{\g__para_standard_everypar_t1}
```

This is followed by executing the kernel and the public hook. The kernel hook is there to enable tagging.

```
30 \@kernel@before@para@begin
31 \hook_use:n {para/begin}
```

If we aren't in horizontal mode any longer the hooks above misbehaved.

```
32 \if_mode_horizontal: \else:
33 \msg_error:nnn { hooks }{ para-mode }{begin}{horizontal} \fi:
```

Finally we reinsert the indentation box (unless suppressed) and then call `\everypar` the way legacy L<sup>A</sup>T<sub>E</sub>X code expects it.

However, adding the public `\everypar` is a bit tricky (see below) so we add that later, and indirectly.

```
34 __para_handle_indent:
35 % \the \everypar % <--- done differently below
36 }
```

```

37 ⟨latexrelease⟩\cs_set:Npn __para_tmp:w #1#2#3#4#5 { }
38 ⟨latexrelease⟩\tl_gput_right:Nx \g__para_standard_everypar_tl {
39 ⟨latexrelease⟩\exp_not:N \the
40 ⟨latexrelease⟩\exp_not:N \toks
41 ⟨latexrelease⟩\exp_after:wN __para_tmp:w \token_to_meaning:N \everypar
42 ⟨latexrelease⟩\c_space_tl
43 ⟨latexrelease⟩}
44 ⟨latexrelease⟩\EndIncludeInRelease
45 ⟨latexrelease⟩\IncludeInRelease{2021/06/01}
46 ⟨latexrelease⟩{\g__para_standard_everypar_tl}{minipage~ fix}
47 ⟨latexrelease⟩
48 ⟨latexrelease⟩\tl_gset:Nn \g__para_standard_everypar_tl {
49 ⟨latexrelease⟩\box_gset_to_last:N \g_para_indent_box
50 ⟨latexrelease⟩\group_begin:
51 ⟨latexrelease⟩\tex_par:D
52 ⟨latexrelease⟩\group_end:
53 ⟨latexrelease⟩\tex_everypar:D {\msg_error:nnnn {hooks} {para-mode} {before} {vertical}}
54 ⟨latexrelease⟩\@kernel@before@para@before
55 ⟨latexrelease⟩\hook_use:n {para/before}
56 ⟨latexrelease⟩\group_begin:
57 ⟨latexrelease⟩\tex_everypar:D {}
58 ⟨latexrelease⟩\skip_zero:N \tex_parskip:D
59 ⟨latexrelease⟩\tex_noindent:D
60 ⟨latexrelease⟩\group_end:
61 ⟨latexrelease⟩\tex_everypar:D{\g__para_standard_everypar_tl}
62 ⟨latexrelease⟩\@kernel@before@para@begin
63 ⟨latexrelease⟩\hook_use:n {para/begin}
64 ⟨latexrelease⟩\if_mode_horizontal: \else:
65 ⟨latexrelease⟩\msg_error:nnnn {hooks} {para-mode} {begin} {horizontal} \fi:
66 ⟨latexrelease⟩__para_handle_indent:
67 ⟨latexrelease⟩}

```

We also have to add the `\everypar` toks register at the end. In case of rollback this is already allocated and we have to find out the correct number (hope this is correctly done)

```

68 ⟨latexrelease⟩\cs_set:Npn __para_tmp:w #1#2#3#4#5 { }
69 ⟨latexrelease⟩\tl_gput_right:Nx \g__para_standard_everypar_tl {
70 ⟨latexrelease⟩\exp_not:N \the
71 ⟨latexrelease⟩\exp_not:N \toks
72 ⟨latexrelease⟩\exp_after:wN __para_tmp:w \token_to_meaning:N \everypar
73 ⟨latexrelease⟩\c_space_tl
74 ⟨latexrelease⟩}
75 ⟨latexrelease⟩\EndIncludeInRelease

```

(End of definition for `\g__para_standard_everypar_tl`.)

`\tex_everypar:D` `\tex_everypar:D` then only has to execute `\g__para_standard_everypar_tl` by default.

```
76 \tex_everypar:D{\g__para_standard_everypar_tl}
```

(End of definition for `\tex_everypar:D`.)

`\everypar` Tokens inserted at the beginning of the paragraph are placed into `\everypar` inside legacy L<sup>A</sup>T<sub>E</sub>X code, e.g., by the list environments or by headings to handle `\clubpenalty`, etc.

Now this isn't any longer the primitive but simply a toks register used in the code above but to legacy L<sup>A</sup>T<sub>E</sub>X code that is transparent.

There is, however, a problem: a handful packages use exactly the same trick and replace the primitive with a token register and call the token register inside the renamed primitive. That is they assume that `\everypar` is the primitive and that it will still be called at the start of the paragraph even if renamed.

But if we have already replaced it by a token register then all they do is to give that token register a new name. Thus our code in `\tex_everypar:D` would call `\everypar` (which is now their token register) and the code that they added ends up in our token register which is then never used at all. A bit mind boggling I guess.

So what we have to do is not to call the token register `\everypar` by its name inside `\tex_everypar:D` but by using its actual register number.

77 `\newtoks \everypar`

After we have allocated a new toks register with the name `\everypar` the actual register number is available (briefly) inside `\allocationnumber`. So instead of `\the\everypar` we have to put `\the\toks<allocated number>` at the end of `\tex_everypar:D`.

So what remains doing is to append a few tokens to the token list `\g_para-standard_everypar_tl` which we do now. We use x expansion here to get the value of `\allocationnumber` in, all the other tokens should not be expanded at this point.

One important point here is to terminate the register allocation number with a real space. This space will get swallowed up when the number is read. Anything else, such as `\scan_stop:` would remain in the input and that would mean that it would interfere with `\everypar` code that attempts to scan ahead to see how the paragraph text starts.

78 `\t1_gput_right:Nx \g_para_standard_everypar_tl {`  
79   `\exp_not:N \the`  
80   `\exp_not:N \toks`  
81   `\the \allocationnumber`  
82   `\c_space_tl`  
83 `}`

(End of definition for `\everypar`.)

**`\g_para_indent_box`** For managing the indentation we need to provide a public accessible box register

84 `\box_new:N \g_para_indent_box`

(End of definition for `\g_para_indent_box`. This function is documented on page 415.)

**`\_para_handle_indent:`** Adding (typesetting) the indent box is straight forward. If it was emptied before it does nothing.

85 `\cs_new:Npn \_para_handle_indent: {`  
86   `\box_use_drop:N \g_para_indent_box`  
87 `}`

The declaration `\para omit indent:` (or `\OmitIndent`) changes that to do nothing.

88 `\cs_new:Npn \para omit indent: {`  
89   `\box_gclear:N \g_para_indent_box`  
90 `}`

(End of definition for `\_para_handle_indent:..`)

`\IndentBox` The L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  names for the indentation box and for suppressing it for use in the `para/begin` hook.

```
91 \cs_set_eq:NN \IndentBox \g_para_indent_box
92 \cs_set_eq:NN \OmitIndent \para omit indent:
```

(End of definition for `\IndentBox` and `\OmitIndent`. These functions are documented on page 415.)

`\para_end:` Adding hooks to the end of a paragraph is similar but here we need to alter the command that is used by T<sub>E</sub>X to end horizontal mode and return to vertical mode, i.e., `\par`.

This is a bit more complicated as this command can appear anywhere either explicitly or implicitly added by T<sub>E</sub>X in certain situations:

- when using `\par` in the code or the document
- when using a blank line (which is converted to `\par`)
- when T<sub>E</sub>X finds any commands incompatible with horizontal mode it issues a `\par` and then rereads the command.

Unfortunately, T<sub>E</sub>X has some (these days) unnecessary optimizations: if a `\vbox` ends and T<sub>E</sub>X is still in horizontal mode it simply exercises the paragraph builder instead of issuing a `\par`. It is therefore necessary for L<sup>A</sup>T<sub>E</sub>X to ensure that this case doesn't happen and all boxes internally have a `\par` command at their end.

This `\par` may or may not run the “par primitive” (which is always available as `\tex_par:D` in `expl3`); it is permissible to have a changed meaning and it is in fact changed by L<sup>A</sup>T<sub>E</sub>X in various ways at various points inside `latex.ltx`. For this L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  code has the following conventions: `\@@par` and `\endgraf` both refer to the default meaning (in the past this was the `initex` primitive) while `\par` is the current meaning which maybe does something else.

We are now going to change this default meaning to instead run `\para_end:`, which ultimately executes the `initex` primitive but additionally adds our hooks when appropriate. This way the change is again transparent to the legacy L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  code.

In most cases `\para_end:` should behave exactly like the primitive and we achieve this by simply expanding it to the primitive which is available to us as `\tex_par:D`. This way we don't have to care about whether T<sub>E</sub>X just does nothing (e.g., if in vertical mode already) or generates an error, etc.

```
93 \cs_new_protected:Npn \para_end: {
```

CCC Maybe needs more explanation. TEMP NOTE: What should happen if in outer hmode with an empty hlist?

The only case we care about is when we are in horizontal mode (i.e., doing typesetting) and not also in inner mode (i.e., making paragraphs and not building an `\hbox`).

```
\bool_lazy_and:nnT
 { \mode_if_horizontal_p: }
 { \bool_not_p:n { \mode_if_inner_p: } }
 { ... }
```

Since this is executed for each and every paragraph in a document we try to stay as fast as possible, so we do not use the above construct but two conditionals instead. Using low-level `\if_mode...` conditions would be even faster but has the danger to conflict with conditionals in the user hooks.

If `\para_end:` is executed while T<sub>E</sub>X is currently doing a low-level assignment the test for horizontal mode may get executed as part of the assignment. That is normally not an issue but we just found one case where it is:

```
\afterassignment\lst@vskip\@tempskipa \z@ \par
```

If  $\text{\TeX}$  is in hmode while that assignment happens then the  $\text{\par}$  is seen in hmode because in the above case the assignment may not be finished (one should have used  $\text{\z@skip}$ ) and the  $\text{\lst@vskip}$  will get inserted into the middle of the conditional. The  $\text{\lst@vskip}$  then changes to vmode and you get a surprising error about the para/end hook having changed modes even if you don't have any hook code(!): it is the inserted  $\text{\lst@vskip}$  that is actually causing the change of mode. This is what happened when the output routines got started while a  $\text{lstlisting}$  environment (that redefines  $\text{\vskip}$  in this way) was active. This is really faulty coding, but we try to be proactive and guard the conditional so that any scanning is first stopped, thus:

```
94 \scan_stop:
95 \mode_if_horizontal:TF {
96 \mode_if_inner:F {
```

In that case the action of the primitive would be to remove the last glue (but no kerns) from the horizontal list (constructed to form a paragraph) and then to append a penalty of 10000 and the  $\text{\parfillskip}$ ; it then passes the whole list to the paragraph builder, which breaks it into lines and  $\text{\TeX}$  then returns to vertical mode.

What we want to do is to add this hook code at the end of the horizontal list before any of the above happens. If there was a glue item at the end of the list then it should get removed before the hook code gets added so we have to arrange for this removal.

As in other similar cases, it may be best to add here a  $\text{\nobreak}$  in case the hook itself adds glue and thus creates a non-explicit and unwanted potential break point. On the other hand (as has been argued) the code in the hook should perhaps have the responsibility for adding such a guard penalty in this case. This needs further analysis and decisions (as in emails).

In either case, good documentation of these hooks is essential, covering what the hook may or should provide and all such related considerations concerning the content.

There is not much point in checking if there was really a glue item at the end of the horizontal list, instead we simply try to remove one using  $\text{\tex_untkip:D}$ : if there wasn't one this will do nothing.

```
97 \tex_untkip:D
```

We then execute the public hook (which may add some final typeset material) followed by the kernel hook that we need for adding tagging support. None of this is supposed to change the mode—at the moment we make only a very simple test for this, more devious changes go unnoticed, but too bad as they will then probably backfire badly.

```
98 \hook_use:n{para/end}
99 \@kernel@after@para@end
100 \mode_if_horizontal:TF {
```

The final action (before getting to the point where  $\text{\tex_par:D}$  is called) is to add an extra glue item so that the primitive is prevented from removing intended glue (if there was some). If we don't do this and the horizontal list ends in several glue items we would end up removing two glue items instead of just the last one, which would be wrong. We use glue (rather than a kern) as that will be removed by the primitive.

There is however one other  $\text{\TeX}$  optimization that hurts: in a sequence like this  $\$\dots \$\text{\par}$  (with  $\text{\par}$  being the primitive)  $\text{\TeX}$  will be in horizontal mode after the display, ready to receive further paragraph text, but since the  $\text{\par}$  follows immediately there is a “null” paragraph at the end and  $\text{\TeX}$  simply throws that away. The space between  $\$\dots \$$  and  $\text{\par}$  got already dropped during the display processing so the  $\text{\par}$  is

not removing any space and appending `\parfillskip`, instead it simply goes silently to vmode.

Now if we would have added something (to prevent glue removal) that would look to TeX like material after the display and so we would end up with an empty paragraph just containing a penalty and `\parfillskip`.

We therefore check if the current hlist does end in glue (`\tex_lastnodetype:D` has the value 11) and if so we add a zero-length guard skip which will be removed by the following `\tex_par:D`.

```
101 \if_int_compare:w 11 = \tex_lastnodetype:D
102 \tex_hskip:D \c_zero_dim
103 \fi:
```

To run the `para/after` hook we first end the paragraph. This means that the `\tex_par:D` at the very end is unnecessary but executing it there unnecessarily is better than having code that tests for all the different mode possibilities.

```
104 \tex_par:D
105 \hook_use:n{para/after}
106 \o@kernel@after@para@after
107 }
```

If we were not horizontal mode (the F case from above) then the earlier hook `para/end` must have been at fault, so we report that.

```
108 { \msg_error:nnn { hooks }{ para-mode }{end}{horizontal} }
```

Finally close out the nested conditionals.

```
109 }
110 }
```

And then we can use the primitive to truly end the paragraph.

```
111 \tex_par:D
112 }
```

(End of definition for `\para_end`. This function is documented on page 414.)

`\para_raw_indent:` and `\para_raw_noindent:` are like the primitives `\indent` and `\noindent` except that they can only be used in vertical mode.

To avoid issues a paragraph started by them should always be ended by `\para_raw_end:` and not by `\para_end:` or `\par` as the latter will execute hooks which then have no counterpart at the beginning of the paragraph. It is the responsibility of the programmer to make sure that they are properly paired.

```
113 \cs_new:Npn \para_raw_indent: {
114 \mode_if_vertical:TF
115 {
116 \tex_everypar:D {
117 \box_gset_to_last:N \g_para_indent_box
118 \tex_everypar:D { \g__para_standard_everypar_tl }
119 __para_handle_indent:
120 \the\tex_everypar }
121 }
122 { \msg_error:nn { latex2e }{ raw-para } }
123 \tex_indent:D
124 }
```

```

125 \cs_new:Npn \para_raw_noindent: {
126 \mode_if_vertical:TF
127 {
128 \tex_everypar:D {
129 \tex_everypar:D { \g__para_standard_everypar_tl }
130 \the\tex_everypar }
131 }
132 { \msg_error:nn { latex2e }{ raw-para } }
133 \tex_noindent:D
134 }
135 \cs_new_eq:NN \para_raw_end: \tex_par:D

```

(End of definition for `\para_raw_indent:`, `\para_raw_noindent:`, and `\para_raw_end:`. These functions are documented on page 415.)

`\RawIndent` The L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> names for starting and ending a paragraph without adding any hooks.

```

\RawNoIndent 136 \cs_set_eq:NN \RawIndent \para_raw_indent:
\RawParEnd 137 \cs_set_eq:NN \RawNoIndent \para_raw_noindent:
138 \cs_set_eq:NN \RawParEnd \para_raw_end:

```

(End of definition for `\RawIndent`, `\RawNoIndent`, and `\RawParEnd`. These functions are documented on page 415.)

This ends the `para` module code.

```
139 <@=
```

`\par` Having the new default definition for `\par` we also have to set it up so that it gets used.  
`\endgraf` This involves three commands: `\par`, `\@@par` (to which L<sup>A</sup>T<sub>E</sub>X resets `\par` occasionally)  
`\@par` and `\endgraf`, which is another name for the “default” action of `\par`.

```

140 \cs_set_eq:NN \par \para_end:
141 \cs_set_eq:NN \@@par \para_end:
142 \cs_set_eq:NN \endgraf \para_end:

```

(End of definition for `\par`, `\endgraf`, and `\@@par`. These functions are documented on page 414.)

While this is not integrated properly into the format we have to redo the `\everypar` setting from the kernel, otherwise that gets lost (as it happens before that file is loaded).

```
143 \everypar{\@nodocument} %% To get an error if text appears before the \document
```

## 3.2 The error messages

This one is used when we detect that some hook code has changed the mode where it shouldn’t, e.g., by starting or ending a paragraph. The first argument is the hook name second the mode it should have stayed in but didn’t.

```

144 \msg_new:nnnn { hooks } { para-mode }
145 {
146 Illegal~mode~ change~ in~ hook~ 'para/#1'.\\
147 Hook~ code~ did~ not~ remain~ in~ #2~ mode.
148 }
149 {
150 Paragraph~ hooks~ cannot~ change~ the~ TeX~ mode~ without~ causing~
151 endless~ recursion.~ The~ hook~ code~ in~ 'para/#1'~ needs~ to~ stay~
152 in~ #2~ mode,~ but~ it~ didn't.~ Examine~ the~ hook~
153 code~ with~ \iow_char:N \\ShowHook~ to~ find~ the~ issue.
154 }

```

And here is one used in the “raw” commands when they are used outside of vertical mode.

```

155 \msg_new:nnnn { latex2e } { raw-para }
156 {
157 Not~ in~ vertical~ mode.
158 }
159 {
160 Starting~ a~ paragraph~ with~ \iow_char:N \\RawIndent~ or~
161 \iow_char:N \\RawNoindent \\
162 (or~ \iow_char:N \\para_raw_indent:~ or~
163 \iow_char:N \\para_raw_noindent:)~ is~ only~ allowed \\
164 if~ LaTeX~ is~ in~ vertical~ mode.
165 }
166 %

# File 17

## ltmeta.dtx

### Abstract

This code defines the `\DocumentMetadata` interface.

## 1 Introduction

In the past there was no dedicated location to declare settings concerning a document as a whole. Settings are placed somewhere in the preamble or with the class options or even with some package options. For some settings this can be too late, for example the pdf version can no longer be changed if a package has used code which already opened the PDF.

`\DocumentMetadata` as a new command unifies such settings in one place. It must be used before `\documentclass` but can be issued more than once there.

At the moment most of the code run by `\DocumentMetadata` is external to the format and subject to change. This includes the supported key/values.

For that reason all that happens right now in the format is to look for suitable support files and if found, to redirect the processing to them.

### 1.1 `\DocumentMetadata`

---

```
\DocumentMetadata \DocumentMetadata{\{key-value list\}}
```

---

The keys defined for `\DocumentMetadata` currently allow to set the PDF version, to set the PDF `/Lang`, to uncompress a PDF, to set the language and to declare a few PDF standards and some color profiles.

`\DocumentMetadata` is also used to activate the new PDF management code and it loads a number of required files for the PDF management code. As this forces the loading of the backend files, a backend which can't be detected automatically like `dvipdfmx`, must be set in the first `\DocumentMetadata` call (if there is more than one).

The full set of keys currently supported is documented in `documentmetadata-support.pdf` for now.

## 2 The Implementation

```
1 {*2ekernel | latexrelease}
Not needed yet but ...
2 %\ExplSyntaxOn
3 <latexrelease> \NewModuleRelease{2022/06/01}{ltmeta}
4 <latexrelease> {Document Metadata handling}
5 \let \IfDocumentMetadataTF \@secondoftwo
6 \protected\def\DocumentMetadata{%
7 \InputIfFileExists{documentmetadata-support.ltx}%
8 {}%
```

The above file is changing `\DocumentMetadata` to a suitable definition (or so we hope), so that we can try again — if not tough.

If the file can't be found we say so and carry on without it.

```

9 {%
10 \@latex@error{No support files for
11 \noexpand\DocumentMetadata found}
12 {Is the 'LaTeX-lab' bundle installed?%
13 \MessageBreak
14 Without it, the declaration is ignored.}%

```

No point in trying this more than once if there are several calls in the document.

```

15 \let\DocumentMetadata\@gobble
16 }%
17 \let \IfDocumentMetadataTF \@firstoftwo
18 \DocumentMetadata
19 }

```

To allow package and class author to support for document links we provide also the new interface commands of the hyperref package for the creation of targets.

```

\MakeLinkTarget
 \LinkTargetOn
 \LinkTargetOff
\NextLinkTarget
20 \langle latexrelease \rangle \IncludeInRelease{2024/11/01}%
21 \langle latexrelease \rangle {\MakeLinkTarget}{Record target name for tagging support}%
22 \ExplSyntaxOn
23 \int_new:N \g__kernel_target_int
24 \NewDocumentCommand \MakeLinkTarget{sO{}m}{%
25 \ifvmode
26 \special{}%
27 \else
28 \@savsf \spacefactor
29 \smash{}%
30 \spacefactor \@savsf
31 \fi
32 \IfBooleanTF {#1}
33 {
34 \tl_gset:Ne \currentHref {#3}
35 }
36 {
37 \int_gincr:N \g__kernel_target_int
38 \tl_gset:Ne \currentHref {target*.int_use:N \g__kernel_target_int}
39 }
40 \UseTaggingSocket{recordtarget}
41 }
42 \ExplSyntaxOff
43 \langle latexrelease \rangle \EndIncludeInRelease
44 \langle latexrelease \rangle \IncludeInRelease{2022/06/01}%
45 \langle latexrelease \rangle {\MakeLinkTarget}{Record target name for tagging support}%
46 \langle latexrelease \rangle \NewDocumentCommand \MakeLinkTarget{sO{}m}{%
47 \langle latexrelease \rangle \ifvmode
48 \langle latexrelease \rangle \special{}%
49 \langle latexrelease \rangle \else
50 \langle latexrelease \rangle \@savsf \spacefactor
51 \langle latexrelease \rangle \smash{}%
52 \langle latexrelease \rangle \spacefactor \@savsf
53 \langle latexrelease \rangle \fi}
54 \langle latexrelease \rangle \EndIncludeInRelease

```

```
55 \NewDocumentCommand\LinkTargetOn{}{}
56 \NewDocumentCommand\LinkTargetOff{}{}
57 \NewDocumentCommand\NextLinkTarget{m}{}{}
```

(End of definition for `\MakeLinkTarget` and others.)

We do not undo `\MakeLinkTarget` and friends if we roll back, in case they are used in packages that themselves do not offer rollback. This way a roll forward adds them, but the dummies remain if you roll back and you don't get missing csname errors if they are used.

```
58 \begin{textrun}{\IncludeInRelease{0000/00/00}{ltmeta}}%
59 \end{textrun} % Undo Document Metadata handling
60 \begin{textrun}{\let\DocumentMetadata\@undefined}
61 \end{textrun}
62 \begin{textrun}{\EndModuleRelease}
63 \end{textrun}
```

Again for the future ...

```
64 \ExplSyntaxOff
65 \If2ekernel|\textrun
```

Restore module prefix (if any):

```
66 \IfModule
```

# File 18

## ltspacex.dtx

### 1 Spacing

This section deals with spacing, and line- and page-breaking.

#### 1.1 User Commands

```
\nopagebreak [⟨i⟩] : ⟨i⟩ = 0,...,4.
 Default argument = 4. Puts a penalty into the vertical list output as follows:
0 : penalty = 0
1 : penalty = \@lowpenalty
2 : penalty = \@medpenalty
3 : penalty = \@highpenalty
4 : penalty = 10000
\pagebreak [⟨i⟩] : same as except negatives of its penalty
\linebreak [⟨i⟩] : analog of the above
\nolinebreak [⟨i⟩] : analog of the above
\samepage : inhibits page breaking most places by setting the following penalties to 10000:
 \interlinepenalty
 \predisplaypenalty
 \postdisplaypenalty
 \interdisplaylinepenalty
 \@beginparpenalty
 \@endparpenalty
 \@itempenalty
 \@secpenalty
 \interfootnotelinepenalty
\\\\ : initially defined to be \newline
 \\\[⟨length⟩] : initially defined to be \vspace{⟨length⟩}\newline
Note: * adds a \vadjust{\penalty 10000}
 OBSOLETE COMMANDS (which never made it into the manual):
 \obeyscr : defines <CR> == \\relax
 \restorecr : restores <CR> to its usual meaning.
```

#### 1.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
 \item \label{item:xxx} Item text.
\end{enumerate}
```

### 1.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `\*\*`.
- Reimplement `\\"`, etc, removing extra `\vadjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\\"`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskip`s include test for zero skip (rather than other tests or no test).
- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.

- Resolve the inconsistency between `\hspace` and `\hspace*`.
- Remove unnecessary `\unskip`s.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix TeX itself.

## 1.4 The code

\ The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

1. efficient execution of plain \\;
2. efficient execution of \\[...];
3. memory use;
4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use \reserved@e and \reserved@f here (other reserved macros are somewhat disastrous).

These changes made \\newline even less robust than it had been, so now it is explicitly robust, like \\.

The internal definition of the ‘normal’ definition of \\.

(End of definition for `\@getpen`.)

`\if@nobreak` Switch used to avoid page breaks caused by `\label` after a section heading, etc. It should be **GLOBALLY** set true after the `\nobreak` and **globally** set false by the next invocation of `\everypar`.

Commands that reset `\everypar` should globally set it false if appropriate.

```

121 \def\@nobreakfalse{\global\let\if@nobreak\iffalse}
122 \def\@nobreaktrue {\global\let\if@nobreak\iftrue}
123 \nobreakfalse

```

(End of definition for `\if@nobreak`.)

`\@savsk` Registers used to save the space factor and last skip.

```

124 \newdimen\@savsk
125 \newcount\@savsf

```

(End of definition for `\@savsk` and `\@savsf`.)

\@bsphack \@bsphack and \@esphack used by macros such as \index and \begin{@float} ... \end{@float} that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with \@bsphack and end with \@esphack. The macro in question should not create any text, nor change the mode.

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when ‘invisible commands’ appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following \addvspace, etc sees the correct glue in \lastskip.

In fact, these improved versions should be used for other cases of ‘whatsits, thingies etc’ which should be invisible. They are only for commands, not environments (see notes on \@EspHack).

BTW, anyone know why the standard hacks are surrounded by \ifmmode\else rather than simply \ifhmode?

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
def \@bsphack{%
 \relax \ifvmode
 \@savsk \lastskip
 \ifdim \lastskip=\z@
 \else
 \vskip -\lastskip
 \fi
\else
 \ifhmode
 \@savsk \lastskip
 \@savsf \spacefactor
 \fi
\fi
```

I think that, in vmode, it is the safest to put in a \nobreak immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
def \@esphack{%
 \relax \ifvmode
 \nobreak
 \ifdim \@savsk=\z@
 \else
 \vskip\@savsk
 \fi
\else
 \ifhmode
 \spacefactor \@savsf
 \ifdim \@savsk>\z@
 \ignorespaces
 \fi
 \fi
\fi
```

```

 \fi
\fi

```

For the moment we are going to ignore the vertical versions until they are correct.

```

126 \def\@bsphack{%
127 \relax
128 \ifhmode
129 \csavsk\lastskip
130 \csavsf\spacefactor
131 \fi}

```

(End of definition for `\@bsphack`.)

- `\@esphack` Companion to `\@bsphack`. If this command is not properly paired with `\@bsphack` one might end up with a low-level TeX error: “BAD spacefactor”. One possible cause is calling `\@bsphack` in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling `\@esphack`. Even if no error is generated that is wrong, because `\@esphack` will then use the saved values for `\@savsk` and `\@savsf` from some earlier invocation of `\@bsphack` which will have nothing to do with the current situation.

\@vbsphack Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \@savsk is nonzero so that the \ignorespaces is put in later. It is not used at present.

```

\def \@vbsphack{ %
 \relax \ifvmode
 \leavevmode
 \@savsk 1sp
 \@savsf \spacefactor
 \else
 \ifhmode
 \@savsk \lastskip
 \@savsf \spacefactor
 \fi
 \fi
}

```

(End of definition for \@vbsphack.)

## 1.5 Vertical spacing

L<sup>A</sup>T<sub>E</sub>X supports the plain T<sub>E</sub>X commands \smallskip, \medskip and \bigskip. However, it redefines them using \vspace instead of \skip.

Extra vertical space is added by the command \addvspace{\<skip>}, which adds a vertical skip of <skip> to the document. The sequence \addvspace{\<s1>} \addvspace{\<s2>} is equivalent to \addvspace{\<maximum of s1, s2>}.

\addvspace should be used only in vertical mode, and gives an error if it's not. The \addvspace command does *not* add vertical space if @minipage is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the \addpenalty{\<penalty>} command. It works properly when \addpenalty and \addvspace commands are mixed.

The @nobreak switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

\@xaddvskip Internal macro for \vspace handling the case that space has previously been added.

```

220 \def\@xaddvskip{%
221 \ifdim\lastskip<\@tempskip
222 \vskip-\lastskip

```

```

223 \vskip\@tempskipb
224 \else

## 1.6 Horizontal space (and breaks)

\nobreakdashes This idea is borrowed from the amsmath package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as -, --, or ---).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final \nobreak).

Note that even if it is not followed by a ‘-’, it still leaves vmode and sets the space-factor; so use it carefully!

```

453 \DeclareRobustCommand{\nobreakdashes}{%
454 \leavevmode
455 \toks@{}%
456 \def\reserved@a##1{\toks@\expandafter{\the\toks@-}%
457 \futurelet\@let@token \reserved@b}%
458 \def\reserved@b {\ifx\@let@token -%
459 \expandafter\reserved@a
460 \else
461 \setbox\z@\hbox{\the\toks@\nobreak}%
462 \unhbox\z@
463 \spacefactor\sffcode`-
464 \fi}%
465 \futurelet\@let@token \reserved@b
466 }
```

(End of definition for \nobreakdashes.)

\nobreakspace \@xobeysp This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active ~ to expand to it since this is the documented behaviour of ~. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the L<sup>A</sup>T<sub>E</sub>X internal commands.

The braces in the definition of `\nobreakspace` are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep `\@xobeysp` as it is widely used; so here it is let to the non-robust command `\nobreakspace`.

The fragile version of `\nobreakspace` needs a brace group after `\nobreakspace` to prevent loss of spaces if it occurs in an expansion context. That's not an issue with the updated `\protected` definition, so we keep the code shorter and avoid that.

```

467 \DeclareRobustCommand{\nobreakspace}{%
468 \leavevmode\nobreak\ }
469 \catcode `~=13
470 </2ekernel>

(End of definition for \LaTeXe.)

# File 20

## ltfiles.dtx

### 1 File Handling

The following user commands are defined in this part:

|                    |                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \document          | (ie \begin{document})                                                                                                                                                                                                 |
|                    | Reads in the .AUX files and \catcode's @ to 12.                                                                                                                                                                       |
| \nofiles           | Suppresses all file output by setting \@filesw false.                                                                                                                                                                 |
| \includeonly       | \{(NAME1, ... ,NAMEn)\}                                                                                                                                                                                               |
|                    | Causes only parts NAME1, ... ,NAMEn to be read by their \include commands. Works by setting partsw true and setting \@partlist to NAME1, ... ,NAMEn.                                                                  |
| \include           | \{(NAME)\}                                                                                                                                                                                                            |
|                    | Does an \input NAME unless \@partsw is true and NAME is not in \@partlist. If \@filesw is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.                                           |
| \input             | \{(NAME)\}                                                                                                                                                                                                            |
|                    | The same as TeX's \input, except it allows optional braces around the file name. In L <sup>A</sup> T <sub>E</sub> X 2 <sub>E</sub> , it also avoids the primitive 'missing file' error, if the file can not be found. |
| \IfFileExists      | \{(NAME)\}\{(then)\}\{(else)\}                                                                                                                                                                                        |
|                    | If the file exists on the system, execute <i>then</i> otherwise execute <i>else</i> .                                                                                                                                 |
| \InputIfFileExists | \{(NAME)\}\{(then)\}\{(else)\}                                                                                                                                                                                        |
|                    | If the file exists on the system, execute <i>then</i> and input <i>NAME</i> otherwise execute <i>else</i> .                                                                                                           |

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old lfonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```

40 \process@table
41 \let\glb@currsize\empty % Force math initialization.
42
43 \normalsize
44 \everypar{}%

```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L<sup>A</sup>T<sub>E</sub>X2.0x and plain T<sub>E</sub>X.)

```

44 \ifx\normalsfcodes\empty
45 \ifnum\sfcode`_=`m
46 \let\normalsfcodes\frenchspacing
47 \else
48 \let\normalsfcodes\nonfrenchspacing
49 \fi
50 \fi

```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of `\language` at this point.

```

51 \ifx\document@default@language\m@ne
52 \chardef\document@default@language\language
53 \fi

```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```

54 \@noskipsecfalse
55 \let \refundefined \relax

```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```

56 \@kernel@before@begindocument
57 \UseOneTimeHook{begindocument}%
58 \@kernel@after@begindocument

```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts are group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn[]` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```

59 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
60 \global\@maxdepth\maxdepth
61 \global\let\@begindocumenthook\@undefined
62 \ifx\@listfiles\@undefined
63 \global\let\@filelist\relax
64 \global\let\@addtofilelist\@gobble
65 \fi

```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```

66 \gdef\do##1{\global\let ##1\@notprerr}%
67 \@preamblecmds

```

The next line saves tokens and also allows `\@nодокумент` to be used directly to trap preamble errors.

```

68 \global\let \@nодокумент \relax

```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```

69 \global\let\do\noexpand
70 \UseOneTimeHook{begindocument/end}%

```

Use of the hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

```

71 \ignorespaces

```

Provide a global definition for `\do` as well, so that it is already defined in the preamble and not late as `\begin{document}` overwriting some definition given by the unsuspecting user in the preamble.

```

72 \let\do\noexpand

```

The `begindocument` hook already existed in the kernel since 1994 under the name `\atbegindocumenthook` the additional ones are originally from the `etoolbox` package under the names `\endpreamblehook` `\afterpreamble`.

```

73 \NewHook{begindocument}
74 \NewHook{begindocument/before}
75 \NewHook{begindocument/end}

```

Above we used two kernel only hooks to be run after the public `begindocument/before` and after `begindocument` hooks.

In `\@kernel@after@begindocument@before` we already place one action: drop the fast execution code for the `env/document/begin` hook. That hook marks the end of the preamble and should therefore only be run once. In a normal document that is anyway the case (so the code would just sit there taking up space afterwards, which these days is rather harmless), however, in more complicated scenarios where several full documents are combined to a single document it might get applied several times with harmful effects.

We therefore explicitly drop it at this point. the coding is somewhat obscure due to the name of the macro which requires constructing.

```

```

(End of definition for *\document* and others.)

**\normalsfcodes** The setting of *\c@empty* is just a flag. This command may be defined in a class or package file. If it is still *\c@empty* at *\begin{document}* it will be defined to be *\frenchspacing* or *\nonfrenchspacing*, depending on which of those appears to be in effect at that point.

```
198 \let \normalsfcodes \c@empty
```

(End of definition for *\normalsfcodes*.)

**\nofiles** Set *\c@fileswfalse* which suppresses the places where L<sup>A</sup>T<sub>E</sub>X makes *\immediate* writes. The *\makeindex* and *\makeglossary* are disabled. *\protected@write* is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a *\whatsit* node is still created, and so spacing is not affected by the *\nofiles* command; to ensure this more generally, the *\if@cnobreak* test is needed.

```

199 \def \nofiles{%
200 \c@fileswfalse
201 \typeout{No auxiliary output files.^J}%
202 \long\def \protected@write{\#1##2##3{%

```

(End of definition for `\protected@write`.)

```
217 \let\@auxout=\@mainaux
```

`\include` In the definition of `\include`, `\def\reserved@b` changed to `\edef\reserved@b` to be  
`\includeonly` consistent with the `\edef` in `\includeonly`. (Suggested by Rainer Schöpf & Frank  
Mittelbach. Change made 20 Jul 88.)

Changed definition of `\include` to allow space at end of file name — otherwise,  
typing `\include{foo }` would cause L<sup>A</sup>T<sub>E</sub>X to overwrite `foo.tex`. Change made 24 May  
89, suggested by Rainer Schöpf and Frank Mittelbach

Made `\include` check for being used inside an `\include`'d file, as this will not work  
and cause surprising results.

```

218 </2ekernel>
219 <*2ekernel | latexrelease>
220 <| latexrelease>\IncludeInRelease{2020/10/01}%
221 <| latexrelease> {\includeonly}{Spaces in file names}%
222 \def\include#1{\relax
223 \ifnum\@auxout=\@partaux
224 \@latex@error{\string\include\space cannot be nested}\@eha
225 \else

```

Here the normalization will add `.tex` for all files, (it uses the same normalization as the  
hooks), so we need to remove that manually. `\@strip@tex@ext` does that.

```

226 \set@curr@file{#1}%
227 \edef\@curr@file{\@strip@tex@ext\@curr@file}%

```

For historical reasons `\@include` expects an argument delimited by a space. This is kept  
(though unnecessary now) to avoid errors in other packages that use `\@include` directly.

```

228 \expandafter\@include\expandafter{\@curr@file} % deliberate space
229 \fi}

```

Here in `\includeonly` we also need to strip `.tex` after normalization:

```

230 \def\includeonly#1{%
231 \@partstrue

```

Because the argument to `\includeonly` is a comma-separated list of filenames where  
there may be comma's preceding some of the filenames or trailing them. Therefore we  
need to take the list apart, remove the unwanted spaces while leaving the spaces *in* the  
filenames intact.

```

232 \let\@partlist\@empty
233 \@for\reserved@a:=#1 \do
234 {%
235 \expandafter\set@curr@file\expandafter{\reserved@a}%
236 \ifx\@partlist\@empty

```

(End of definition for \@charlb and \@charrb.)

## 1.1 Safe Input Macros

\@curr@file File name handling is done by generating a csname from the provided file name (which means that UTF-8 octets gets turned into strings as this is what happens if they appear in a csname due to the code in `utf8.def`). By setting \escapchar to -1 we ensure that we don't get a backslash in front. As a result we end up with all characters as catcode 12 (plus spaces). We then sometimes add quotes around the construct (removing any existing inner quotes). Sometimes we only remove the quotes if they have been supplied by the user. There is clearly some room for improvement.

A side effect of the new code is that we will see quotes around file name displays where there haven't been any before.

For compatibility with existing code using `{abc}.tex` or `{one.two}.png`, an initial brace group is discarded before expansion and \string is applied. The content of the brace group is discarded. This means that a leading space will be lost unless protected (by { } or " " or \space) but filenames with a space are hopefully rare.

The definition below is from 2019 and only used during kernel bootstrapping, later on in `ltfilehook.dtx` it will get overwritten.

```

452 \def\set@curr@file#1{%
453 \begingroup

\IfFileExists@  
\IfFileExists@@ Argument #1 is \@curr@file so catcode 12 string with no quotes.

The original definition picked up arguments #2 and #3 in a way that they couldn't contain unbalanced conditionals. A better implementation would have been not to pick up the arguments at all but instead use the usual \@firstoftwo and \@secondoftwo. However, that changes how # is interpreted and so we can't do that nowadays without invalidating a lot of code. Therefore the somewhat curious construction near the end.

Earlier versions used \openin here, but this led to two code paths, one in expl3 and one here. To avoid that, and as the expl3 approach works by expansion, we use that here. As we need the file name to include the path, the actual expl3 function used is not the file existence test!

```

(End of definition for `\@iinput`.)

`\@input` Define `\@input` in terms of `\IfFileExists`. So this is a ‘safe input’ command, but the files input are not listed by `\listfiles`.

We don’t want `.aux`, `.toc` files etc be listed by `\listfiles`. However, something like `.bb1` probably should be listed and thus should be implemented not by `\@input`.

```

672 \def\@input#1{%
673 \IfFileExists{#1}{\@input\@filef@und}{\typeout{No file #1.}}}

```

(End of definition for `\@input`.)

`\@input@` Version of `\@input` that does add the file to `\@filelist`.

```

674 \def\@input@#1{\InputIfFileExists{#1}{}{\typeout{No file #1.}}}

```

(End of definition for `\@input@`.)

`\@missingfileerror` This ‘error’ command avoids TEX’s primitive missing file loop.

Missing file error. Prompt for a new filename, offering a default extension.

Changes to `\@missingfileerror`: rather than trying to input the file by force, now `\@missingfileerror` just returns three `\@missingfile@⟨part⟩` and the caller macro is responsible for doing the right thing with it.

```

 \let\@addtofilelist\@gobble
 \fi}
800 \onlypreamble\listfiles

```

```
\@dofilelist 801 \let\@dofilelist\relax
802 ⟨/2ekernel⟩
(End of definition for \obsoletefile and others.)
```

# File 21

## ltoutenc.dtx

### 1 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OML, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {t1enc.def}
\input {ot1enc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{\command}{{\encoding}}
[{\number}][{\default}]{\commands}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{{\@xxxii 1}}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{\command}{{\encoding}}
[{\number}][{\default}]{\commands}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{\command}{{\encoding}}{\slot}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{\command}{{\encoding}}{\slot}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{<command>}
 {<encoding>}{{<argument>}}{<slot>}
```

This command declares a composite letter, for example in the T1 encoding '\'{a} is slot 225, which is declared by:

```
\DeclareTextComposite{'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{<command>}
 {<encoding>}{{<argument>}}{<text>}
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@\ht\z@\advance\dimen@-1ex%
\rlap{\raise.67\dimen\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{<encoding>}{{<command>}}
```

For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{<encoding>}{{<command>}}{<text>}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{'}{a}` has the same effect as:

```
{\fontencoding{OT1}\selectfont'\{\fontencoding{OT2}\selectfont a\}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{\command}{\definition}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction  $\frac{1}{4}$ ) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\Provide` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{\command}{\definition}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{\command}{\encoding}
\DeclareTextAccentDefault{\command}{\encoding}
```

are short for:

```
\DeclareTextCommandDefault{\command}
 {\UseTextSymbol{\encoding}{\command}}
\DeclareTextCommandDefault[1]{\command}
 {\UseTextAccent{\encoding}{\command}#1}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

## 1.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since \$ and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flaky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L<sup>A</sup>T<sub>E</sub>X will still find the encoding specific definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L<sup>A</sup>T<sub>E</sub>X to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar} {T1}
\DeclareTextCommandDefault{\textdollar}
 {\UseTextSymbol{TS1}\textdollaroldstyle}
```

## 1.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

## 1.3 Docstrip modules

This .dtx file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

|          |                                                                                                                                                                                                 |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T1       | generates <code>t1enc.def</code> for the Cork encoding.                                                                                                                                         |
| TS1      | generates <code>ts1enc.def</code> for the Text Companion encoding.                                                                                                                              |
| TS1sty   | generates <code>textcomp.sty</code> , package that sets up use of the Text Companion encoding.                                                                                                  |
| OT1      | generates <code>ot1enc.def</code> for Knuth's CM encoding.                                                                                                                                      |
| OMS      | generates <code>omsenc.def</code> for Knuth's math symbol encoding.                                                                                                                             |
| OML      | generates <code>omlenc.def</code> for Knuth's math letters encoding.                                                                                                                            |
| OT4      | generates <code>ot4enc.def</code> for the Polish extension to the OT1 encoding, created by B. Jackowski and M. Ry  ko for use with the Polish version of Computer Modern and Computer Concrete. |
| TU       | generates <code>tuenc.def</code> for Unicode font encoding.                                                                                                                                     |
| package  | generates <code>fontenc.sty</code> for selecting encodings.                                                                                                                                     |
| 2ekernel | for the kernel commands.                                                                                                                                                                        |

## 1.4 Definitions for the kernel

### 1.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in .def files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1 {*2ekernel}
2 \message{font encodings,}

Far too many macros in one block here!
```

```
\DeclareTextCommand
\ProvideTextCommand
\DeclareTextSymbol
 @dec@text@cmd
\chardef@text@cmd
 @changed@cmd
 @changed@x
\TextSymbolUnavailable
 @inmathwarn
```

If you say:

```
\DeclareTextCommand{\foo}{T1}...
```

then `\foo` is defined to be `\T1-cmd \foo \T1\foo`, where `\T1\foo` is *one* control sequence, not two! We then call `\newcommand` to define `\T1\foo`.

```
3 \def\DeclareTextCommand{%
4 @dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
6 @dec@text@cmd\providecommand}
7 \def@enc@info#1{%
8 \GenericInfo{(Encoding)\@spaces\@spaces\@spaces\space\space}%
9 {LaTeX Encoding Info: \space\space\space#1}}%
10 \def@dec@text@cmd#1#2#3{%
```

For logging, there are a number of different cases to cater for.

```
11 \ifcsname #3\string#2\endcsname
12 @enc@info{%
13 \ifx#1\providecommand
14 Ignoring declaration for
15 \else
16 Redeclaring
17 \fi
18 text}
```

This test distinguishes between commands and symbols:

```
19 \ifx#1\chardef@text@cmd
20 symbol
21 \else
22 command
23 \fi
24 \string#2 (encoding #3)}%
25 \fi

26 \expandafter\def\expandafter#2%
27 \expandafter{%
28 \csname#3-cmd\expandafter\endcsname
29 \expandafter#2%
30 \csname#3\string#2\endcsname
31 }%
32 \let\@ifdefinable\@rc@ifdefinable
33 \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `\@dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providetcommand` (used just above) both handle the resetting of `\@ifdefinable` (following its disabling in `\@dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```

34 \def\chardef@text@cmd{%
35 \let\@ifdefinable\@ifdefinable
36 \chardef
37 }
38 \def\DeclareTextSymbol#1#2#3{%
39 \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
40 }
```

The declarations are only available before `\begin{document}`.

```

41 \onlypreamble\DeclareTextCommand
42 \onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is `T1`, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like `$X_\copyright$` work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `\? \foo` if it is defined, and an error message otherwise.

When the encoding is changed from `T1` to `OT1`, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

43 \def\@current@cmd#1{%
44 \ifx\protect\@typeset@protect
45 \cinmathwarn#1%
46 \else
47 \noexpand#1\expandafter\gobble
48 \fi}
```

```

49 \def\@changed@cmd#1#2{%
50 \ifx\protect\@typeset@protect
51 \@inmathwarn#1%
52 \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
53 \expandafter\ifx\csname ?\string#1\endcsname\relax
54 \expandafter\def\csname ?\string#1\endcsname{%
55 \TextSymbolUnavailable#1%
56 }%
57 \fi
58 \global\expandafter\let
59 \csname\cf@encoding\string#1\expandafter\endcsname
60 \csname ?\string#1\endcsname
61 \fi
62 \csname\cf@encoding\string#1%
63 \expandafter\endcsname
64 \else
65 \noexpand#1%
66 \fi}

67 \gdef\TextSymbolUnavailable#1{%
68 \@latex@error{%
69 Command \protect#1 unavailable in encoding \cf@encoding%
70 }\@eha}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\@empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```

71 \def\@inmathwarn#1{%
72 \ifmmode
73 \@latex@warning{Command \protect#1 invalid in math mode}%
74 \fi}

```

(End of definition for `\DeclareTextCommand` and others.)

`\DeclareTextCommandDefault`

These define commands with encoding `?`.

Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```

75 \def\DeclareTextCommandDefault#1{%
76 \DeclareTextCommand#1?}
77 \def\ProvideTextCommandDefault#1{%
78 \ProvideTextCommand#1?}
79 \onlypreamble\DeclareTextCommandDefault
80 \%onlypreamble\ProvideTextCommandDefault

```

They require `\?-cmd` to be initialized as `\@changed@cmd`.

```
81 \expandafter\let\csname?-cmd\endcsname\@changed@cmd
```

*(End of definition for \DeclareTextCommandDefault and \ProvideTextCommandDefault.)*

\DeclareTextAccent This is just a disguise for defining a T<sub>E</sub>X \accent command.

```
82 \def\DeclareTextAccent#1#2#3{%
83 \DeclareTextCommand#1{#2}{\add@accent{#3}}}
84 \onlypreamble\DeclareTextAccent
```

*(End of definition for \DeclareTextAccent.)*

\add@accent To save space this code is shared between all text accents that are set using the \accent primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve \setbox operations which also inhibit the mechanism of the \accent primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

```
85 \def\add@accent#1#2{\hmode@bgroup}
```

Turn off the group in \UseTextSymbol in case this is used inside the argument of \add@accent.

```
86 \let\hmode@start@before@group\@firstofone
87 \setbox\@tempboxa\hbox{#2}%
```

When presetting the argument in a box we record its \spacefactor for later use after the accent got typeset. This way something like \`A gets the spacefactor of A (i.e., 999) rather than the default value of 1000.

```
88 \global\mathchardef\accent@spacefactor\spacefactor}%
```

The accent primitive doesn't allow things \begingroup to interfere between accent and base character. Therefore we need to avoid that (they are some hidden inside \maybe@load@fontshape). As we don't have to load the fontshape in this case (as that already happened in the box above, if necessary), we simply disable that part of the code temporarily. We also ignore \ignorespaces which has the same issue and may show up as part of \normalfont if that is used.

```
89 \let\maybe@load@fontshape\relax
90 \let\ignorespaces\relax
91 \accent#1 #2\egroup\ifmmode\else\spacefactor\accent@spacefactor\fi}
```

Default definition for \accent@spacefactor prevents a horrible death of the above macro inside an unprotected \edef.

```
92 \let\accent@spacefactor\relax
```

*(End of definition for \add@accent.)*

\hmode@bgroup

```
93 \def\hmode@bgroup{\leavevmode\bgroup}
```

*(End of definition for \hmode@bgroup.)*

```

\DeclareTextCompositeCommand
\DeclareTextComposite
 @text@composite
 @text@composite@x
 @strip@args

```

Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `@text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
#1 -> @text@composite \T1\foo #1@empty @text@composite {...}
```

where ... is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```

94 </2ekernel>
95 <latexrelease>\IncludeInRelease{2017/04/15}{\DeclareTextCompositeCommand}
96 <latexrelease> {test for undeclared accent}%
97 <2ekernel | latexrelease>
98 \def\DeclareTextCompositeCommand#1#2#3#4{%
99 \expandafter\let\expandafter\reserved@a\csname#2\string#1\endcsname
100 \ifx\reserved@a\relax

141 \if{latexrelease}\EndIncludeInRelease
142 {*2ekernel}
143 @onlypreamble\DeclareTextCompositeCommand

```

This all works because:

```
\@text@composite \T1\foo A\empty \@text@composite {...}
```

expands to \\T1\\foo-A if \\T1\\foo-A has been defined, and {...} otherwise.

Note that \@text@composite grabs the first token of the argument and puts just that in the csname. This is so that \'{\textit{e}} will work—it checks whether \\T1\\'-\\textit{e} is defined (which presumably it isn't) and so expands to {\\accent 1 \\textit{e}}.

This trick won't always work, for example \'{{\itshape e}} will expand to (with spaces added for clarity):

```
\csname \string \T1\` - \string {\itshape e} \empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use \csname lookups as a fast way of accessing composites.

This has an unfortunate ‘misfeature’ though, which is that in the T1 encoding, \'{aa} produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the \empty is used in \@text@composite so that accents will work even when the argument is empty. If you say \'{} then this looks up \\T1\\'-\\empty, which ought to be \\relax, and so all is well. If we didn't include the \empty, then \'{} would expand to:

```
\csname \string \T1\` - \string \endcsname
```

so the \endcsname would be \string'ed and the whole of the rest of the document would be put inside the \csname. This would not be good.

```

144 \def{@text@composite#1#2#3@text@composite{%
145 \expandafter@text@composite@x
146 \csname\string#1-\string#2\endcsname}

```

Originally the \@text@composite@x macro had two arguments and if #1 was not \\relax it was executed, otherwise #2 was executed. All this happened within the \\ifx code so that neither #1 nor #2 could have picked up any additional arguments from the input stream. This has now being changed using the typical \@firstoftwo / \@secondoftwo coding. This way the final expansion will happen without any \\else or \\fi intervening in the case that we need to get a further token from the input stream.

```

147 \def{@text@composite@x#1{%
148 \ifx#1\relax
149 \expandafter@secondoftwo
150 \else
151 \expandafter@firstoftwo
152 \fi
153 #1}

```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```

154 \catcode\z@=11\relax
155 \def\DeclareTextComposite#1#2#3#4{%
156 \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
157 \bgroup
158 \lccode\z@#4%
159 \lowercase{%
160 \egroup
161 \reserved@a ^~@}}
162 \catcode\z@=15\relax
163 \onlypreamble\DeclareTextComposite
(End of definition for \DeclareTextCompositeCommand and others.)
164 </2ekernel>
165 <*2ekernel | latexrelease>
166 <latexrelease>\IncludeInRelease{2019/10/01}%
167 <latexrelease> {\UseTextAccent}{Make commands robust}%

```

`\UseTextAccent` `\UseTextSymbol` `\UseTextEncoding` These fragile commands access glyphs from different encodings. They use grotty low-level calls to the font selection scheme for speed, and in order to make sure that `\UseTextSymbol` doesn't do anything which you're not allowed to do between an `\accent` and its glyph.

For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

```

168 \DeclareRobustCommand*\UseTextAccent[3]{%
169 \hmode@start@before@group
170 {%
171 \let\hmode@start@before@group@\firstofone
172 \let\@curr@enc\cf@encoding
173 \UseTextEncoding{#1}%

191 ⟨latexrelease⟩\kernel@make@fragile\UseTextSymbol
192 ⟨latexrelease⟩
193 ⟨latexrelease⟩\EndIncludeInRelease
194 ⟨*2ekernel⟩

```

Switch to a different text encoding without any grouping for use in \UseTextAccent or \UseTextSymbol (and for \oldstylenums).

```

195 \def\@use@text@encoding#1{%
196 \edef\f@encoding{#1}%
197 \xdef\font@name{%
198 \csname\curr@fontshape/\f@size\endcsname}%
199 \pickup@font
200 \font@name
201 \c@enc@update}%

```

(End of definition for \UseTextAccent, \UseTextSymbol, and \@use@text@encoding.)

\hmode@start@before@group The \hmode@start@before@group starts hmode and should be immediately followed by an explicit {\dots}. Its purpose is to ensure that hmode is started before this group is opened. Inside \add@accent and \UseTextAccent it is redefined to remove this group so that it doesn't conflict with the \accent primitive.

For a detailed discussion see pr/3160.

```

202 \let\hmode@start@before@group\leavevmode

```

(End of definition for \hmode@start@before@group.)

\DeclareTextSymbolDefault \DeclareTextAccentDefault Some syntactic sugar. Again, these should probably be optimized for speed.

```

203 \def\DeclareTextSymbolDefault#1#2{%
204 \DeclareTextCommandDefault#1{\UseTextSymbol{#2}{#1}}%
205 \def\DeclareTextAccentDefault#1#2{%
206 \DeclareTextCommandDefault#1{\UseTextAccent{#2}{#1}}%
207 \onlypreamble\DeclareTextSymbolDefault
208 \onlypreamble\DeclareTextAccentDefault

```

(End of definition for \DeclareTextSymbolDefault and \DeclareTextAccentDefault.)

\UndeclareTextCommand This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```

209 \def\UndeclareTextCommand#1#2{%

```

If there is no declaration for the current encoding do nothing.

```

210 \ifcsname #2\string#1\endcsname

```

Else: throw away that declaration.

```

211 \c@enc@info{Undeclare text command \string#1 (encoding #2)}%
212 \global\expandafter\let\csname#2\string#1\endcsname
213 \undefined

```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command `\foo` would look similar to `\T1-cmd \foo \T1\foo` (three tokens).

Of course, instead of `\T1` one could see a different encoding name; which one depends the encoding for which `\foo` was declared last.

Now assume we have just removed the declaration for `\foo` in `\T1` and the top-level of `\foo` expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset `\foo` within `\T1` instead of getting the default definition for `\foo`. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by `?`.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like `\?-cmd \foo \?\foo` which is done by the following (readable?) code:

```

214 \expandafter\expandafter\expandafter
215 \ifx\expandafter\@thirdofthree#1\@undefined
216 \expandafter\gdef\expandafter#1\expandafter
217 {\csname ?-cmd\expandafter\endcsname\expandafter
218 #1\csname?\string#1\endcsname}%
219 \fi
220 \else
221 \@enc@info{Text command \string#1 (encoding #2) is not declared}%
222 \fi
223 }
224 \onlypreamble\UndeclareTextCommand

```

(End of definition for `\UndeclareTextCommand`.)

### 1.4.2 Hyphenation

```

\patterns
\@@patterns
\hyphenation
\@@hyphenation
 \%\\let\\@@patterns\\patterns
 \%\\let\\@@hyphenation\\hyphenation
 \%\\def\\patterns{%
 \%\\bgroup
 \%\\let\\protect\\empty

 \%\\let\\protect\\empty
 \%\\let\\@typeset\\protect\\empty
 \%\\let\\@changed@x\\@changed@x@mouth
 \%\\afterassignment\\egroup
 \%\\@@hyphenation
 \%}

```

(End of definition for `\patterns` and others.)

### 1.4.3 Miscellania

- \a The \a command is used to access the accent commands even when they have been redefined (for example by the `tabbing` environment). Its internal name is `\@tabacckludge`.

The `\string` within the `\csname` guards against something like ' being active at the point of use.

```
243 \def\@tabacckludge#1{\expandafter\@changed@cmd
244 \csname\string#1\endcsname\relax}
245 \let\@a=\@tabacckludge
```

(End of definition for `\a`.)

### 1.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like `\ae` and `\ss`) or by the TeX Users Group Technical Working Group on multi-lingual typesetting (like `\th` and `\ng`) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like `\guillemotleft` and `\quotedblbase`). Unfortunately, this naming scheme won't work for all glyphs, since some names (like `\space`) are already used, and some (like `\endash`) are very likely to be defined by users. So we're now using the naming scheme of `\text` followed by the Adobe name, (like `\textendash` and `\textsterling`). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like `\textcompwordmark`). Sigh.

Some accents from OT1:

```
246 \DeclareTextAccentDefault{\}{OT1}
247 \DeclareTextAccentDefault{\'}{OT1}
248 \DeclareTextAccentDefault{\.}{OT1}
249 \DeclareTextAccentDefault{\=}{OT1}
250 \DeclareTextAccentDefault{\H}{OT1}
251 \DeclareTextAccentDefault{\^}{OT1}
252 \DeclareTextAccentDefault{\`}{OT1}
253 \DeclareTextAccentDefault{\b}{OT1}
254 \DeclareTextAccentDefault{\c}{OT1}
255 \DeclareTextAccentDefault{\d}{OT1}
256 \DeclareTextAccentDefault{\r}{OT1}
257 \DeclareTextAccentDefault{\u}{OT1}
258 \DeclareTextAccentDefault{\v}{OT1}
259 \DeclareTextAccentDefault{\~}{OT1}
```

Some symbols from OT1:

```
260 \% \DeclareTextSymbolDefault{\AA}{OT1}
261 \DeclareTextSymbolDefault{\AE}{OT1}
262 \DeclareTextSymbolDefault{\L}{OT1}
263 \DeclareTextSymbolDefault{\OE}{OT1}
264 \DeclareTextSymbolDefault{\O}{OT1}
265 \% \DeclareTextSymbolDefault{\aa}{OT1}
266 \DeclareTextSymbolDefault{\ae}{OT1}
267 \DeclareTextSymbolDefault{\i}{OT1}
```

```

268 \DeclareTextSymbolDefault{\j}{OT1}
269 \DeclareTextSymbolDefault{\ij}{OT1}
270 \DeclareTextSymbolDefault{\IJ}{OT1}
271 \DeclareTextSymbolDefault{\l}{OT1}
272 \DeclareTextSymbolDefault{\oe}{OT1}
273 \DeclareTextSymbolDefault{\o}{OT1}
274 \DeclareTextSymbolDefault{\ss}{OT1}
275 \DeclareTextSymbolDefault{\textdollar}{OT1}
276 \DeclareTextSymbolDefault{\textemdash}{OT1}
277 \DeclareTextSymbolDefault{\textendash}{OT1}
278 \DeclareTextSymbolDefault{\textexclamdown}{OT1}
279 \% \DeclareTextSymbolDefault{\texthyphenchar}{OT1}
280 \% \DeclareTextSymbolDefault{\texthyphen}{OT1}
281 \DeclareTextSymbolDefault{\textquestiondown}{OT1}
282 \DeclareTextSymbolDefault{\textquotedblleft}{OT1}
283 \DeclareTextSymbolDefault{\textquotedblright}{OT1}
284 \DeclareTextSymbolDefault{\textquotleft}{OT1}
285 \DeclareTextSymbolDefault{\textquotright}{OT1}
286 \DeclareTextSymbolDefault{\textsterling}{OT1}

```

Some symbols from OMS:

```

287 \DeclareTextSymbolDefault{\textasteriskcentered}{OMS}
288 \DeclareTextSymbolDefault{\textbackslash}{OMS}
289 \DeclareTextSymbolDefault{\textbar}{OMS}
290 \DeclareTextSymbolDefault{\textbardbl}{OMS}
291 \DeclareTextSymbolDefault{\textbraceleft}{OMS}
292 \DeclareTextSymbolDefault{\textbraceright}{OMS}
293 \DeclareTextSymbolDefault{\textbullet}{OMS}
294 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
295 \DeclareTextSymbolDefault{\textdagger}{OMS}
296 \DeclareTextSymbolDefault{\textparagraph}{OMS}
297 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
298 \DeclareTextSymbolDefault{\textsection}{OMS}
299 \DeclareTextAccentDefault{\textcircled}{OMS}

```

Some symbols from OML:

```

300 \DeclareTextSymbolDefault{\textless}{OML}
301 \DeclareTextSymbolDefault{\textgreater}{OML}
302 \DeclareTextAccentDefault{\t}{OML}

```

Some defaults we can fake.

The interface for defining \copyright changed, it used to use \expandafter to add braces at the appropriate points.

```

303 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
304 % \expandafter\def\expandafter
305 % \copyright\expandafter{\expandafter{\copyright}}
306 \DeclareTextCommandDefault{\textasciicircum}{\^{}}
307 \DeclareTextCommandDefault{\textasciitilde}{\~{}}
308 \DeclareTextCommandDefault{\textunderscore}{%
309 \leavevmode \kern.06em\vbox{\hrule\@width.3em}}

```

There is no good reason anymore to fake \textcompwordmark.

```

310 \% \DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
311 \DeclareTextSymbolDefault{\textcompwordmark}{T1}

```

```

312 \DeclareTextCommandDefault{\textvisiblespace}{%
313 \mbox{\kern.06em\vrule \@height.3ex}%
314 \vbox{\hrule \@width.3em}%
315 \hbox{\vrule \@height.3ex}%
}

Using \fontdimen3 in the next definition is some sort of a kludge (since it is the
interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since
there it is zero).

316 \DeclareTextCommandDefault{\textellipsis}{%
317 .\kern\fontdimen3\font
318 .\kern\fontdimen3\font
319 .\kern\fontdimen3\font}

320 \% \DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
321 \DeclareTextCommandDefault{\textregistered}{\textcircled{%
322 \check@mathfonts\fontsize\sf@size\z@\math@fontsfalse\selectfont R}}
323 \DeclareTextCommandDefault{\texttrademark}{TM}
324 \DeclareTextCommandDefault{\SS}{SS}

325 \DeclareTextCommandDefault{\textordfeminine}{a}
326 \DeclareTextCommandDefault{\textordmasculine}{o}

```

#### 1.4.5 Math material

Some commands can be used in both text and math mode:

```

327 \ DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textdollar\fi}
We use \protected not \DeclareRobustCommand so that \bigl\{ etc. works inside
\protected@edef.

328 \protected\def\{{\ifmmode\lbrace\else\textbraceleft\fi}
329 \protected\def\}{\ifmmode\rbrace\else\textbraceright\fi}

330 \ DeclareRobustCommand{\P}{\ifmmode\mathparagraph\else\textparagraph\fi}
331 \ DeclareRobustCommand{\S}{\ifmmode\mathsection\else\textsection\fi}
332 \ DeclareRobustCommand{\dag}{\ifmmode\dagger\else\textdagger\fi}
333 \ DeclareRobustCommand{\ddag}{\ifmmode\ddagger\else\textdaggerdbl\fi}

```

For historical reasons \copyright needs {} around the definition in maths.

```

334 \ DeclareRobustCommand{_}{%
335 \ifmmode\nfss@text{\textunderscore}\else\textunderscore\fi}
336 \ DeclareRobustCommand{\copyright}{%
337 \ifmmode\nfss@text{\textcopyright}\else\textcopyright\fi}
338 \ DeclareRobustCommand{\pounds}{%
339 \ifmmode\mathsterling\else\textsterling\fi}
340 \ DeclareRobustCommand{\dots}{%
341 \ifmmode\mathellipsis\else\textellipsis\fi}
342 \let\ldots\dots

```

## 1.5 Definitions for the OT1 encoding

The definitions for the ‘T<sub>E</sub>X text’ (OT1) encoding.

Declare the encoding.

```

396 {*OT1}
397 \DeclareFontEncoding{OT1}{}{}

```

Declare the accents.

```

398 \DeclareTextAccent{"}{OT1}{127}
399 \DeclareTextAccent{'}{OT1}{19}
400 \DeclareTextAccent{.}{OT1}{95}
401 \DeclareTextAccent{=}{OT1}{22}
402 \DeclareTextAccent{`}{OT1}{94}
403 \DeclareTextAccent{'}{OT1}{18}
404 \DeclareTextAccent{-}{OT1}{126}
405 \DeclareTextAccent{H}{OT1}{125}
406 \DeclareTextAccent{u}{OT1}{21}
407 \DeclareTextAccent{v}{OT1}{20}
408 \DeclareTextAccent{r}{OT1}{23}

```

Some accents have to be built by hand: Note that `\o@align` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from plain.tex since that now has two incompatible definitions.

```

409 \DeclareTextCommand{\b}{OT1}[1]
410 {\hmode@bgroup\o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
411 \vbox to .2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
412 \DeclareTextCommand{\c}{OT1}[1]
413 {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent24 #1%
414 \else\o@align{\unhbox\z@\crcr\hidewidth\char24\hidewidth}\fi}
415 \DeclareTextCommand{\d}{OT1}[1]
416 {\hmode@bgroup
417 \o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

418 \DeclareTextSymbol{\AE}{OT1}{29}
419 \DeclareTextSymbol{\OE}{OT1}{30}
420 \DeclareTextSymbol{\O}{OT1}{31}
421 \DeclareTextSymbol{\ae}{OT1}{26}
422 \DeclareTextSymbol{\i}{OT1}{16}
423 \DeclareTextSymbol{\j}{OT1}{17}
424 \DeclareTextSymbol{\oe}{OT1}{27}
425 \DeclareTextSymbol{\o}{OT1}{28}
426 \DeclareTextSymbol{\ss}{OT1}{25}
427 \DeclareTextSymbol{\textemdash}{OT1}{124}
428 \DeclareTextSymbol{\textendash}{OT1}{123}

```

The `\nobreak\hskip\z@` is there to prevent a break after the hyphen but allow later breaks in the remainder of the word.

```

429 \DeclareTextCommand{\textnonbreakinghyphen}{OT1}{\mbox{-}\nobreak\hskip\z@}
430 \DeclareTextCommand{\textfiguredash}{}{OT1}{\textendash}
431 \DeclareTextCommand{\texthorizontalbar}{}{OT1}{\textemdash}

```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```

432 \%{\DeclareTextSymbol{\textexclamdown}{OT1}{60}}
433 \%{\DeclareTextSymbol{\textquestiondown}{OT1}{62}}
434 \DeclareTextCommand{\textexclamdown}{OT1}{!'}
435 \DeclareTextCommand{\textquestiondown}{OT1}{?'}
436 \%{\DeclareTextSymbol{\texthypenchar}{OT1}{'-}}
437 \%{\DeclareTextSymbol{\texthypen}{OT1}{'-}}

```

```

438 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
439 \DeclareTextSymbol{\textquotedblright}{OT1}{`}
440 \DeclareTextSymbol{\textquotelleft}{OT1}{`}
441 \DeclareTextSymbol{\textquoteright}{OT1}{`}

```

Some symbols which are faked from others:

```

442 % \DeclareTextCommand{\aa}{OT1}
443 % {{\accent23a}}
444 \DeclareTextCommand{\L}{OT1}
445 {\leavevmode\setbox z@\hbox{L}\hb@xt@wd{z@\hss@xxxii L}}
446 \DeclareTextCommand{\l}{OT1}
447 {\hmode@bgroup@xxxii l\egroup}
448 % \DeclareTextCommand{\AA}{OT1}
449 % {\leavevmode\setbox z@\hbox{h}\dimen@\ht{z@\advance\dimen@-1ex%
450 % \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

In the OT1 encoding Å has a hand-crafted definition, so we have here the first recorded explicit use of \DeclareTextCompositeCommand.

```

451 \DeclareTextCompositeCommand{\r}{OT1}{A}
452 {\leavevmode\setbox z@\hbox{!}\dimen@\ht{z@\advance\dimen@-1ex%
453 \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```

454 \DeclareTextCommand{\ij}{OT1}{%
455 \nobreak\hskip z@skip i\kern-0.02em\nobreak\hskip z@skip j}
456 \DeclareTextCommand{\IJ}{OT1}{%
457 \nobreak\hskip z@skip I\kern-0.02em\nobreak\hskip z@skip J}

```

In the OT1 encoding, £ and \$ share a slot.

```

458 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
459 \ifdim \fontdimen@ne\font > z@
460 \slshape
461 \else
462 \upshape
463 \fi
464 \char`\$\egroup}
465 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
466 \ifdim \fontdimen@ne\font > z@
467 \itshape
468 \else
469 \fontshape{ui}\selectfont
470 \fi
471 \char`\$\egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true L<sup>A</sup>T<sub>E</sub>X internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

472 \DeclareTextComposite{\.}{OT1}{i}{`i}
473 \DeclareTextComposite{\.}{OT1}{i}{`i}
474 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge`i}
475 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge'i}
476 \DeclareTextCompositeCommand{\^}{OT1}{i}{`^i}

```

```

477 \DeclareTextCompositeCommand{"}{OT1}{i}{"\i}
478 \DeclareTextCompositeCommand{=}{OT1}{i}{=\i}

 T1 encoding is given more extensive set of overloads for \c But here we just adjust
\c{g}.

479 \ifx\textcommaabove\@undefined\else
480 \DeclareTextCompositeCommand{\c}{OT1}{g}{\textcommaabove{g}}
481 \fi
482
```

## 1.6 Definitions for the T1 encoding

The definitions for the ‘Extended TeX text’ (T1) encoding.

Declare the encoding.

```

483 <*T1>
484 \DeclareFontEncoding{T1}{}{}
```

Declare the accents.

```

485 \DeclareTextAccent{'}{T1}{0}
486 \DeclareTextAccent{'}{T1}{1}
487 \DeclareTextAccent{'^}{T1}{2}
488 \DeclareTextAccent{'`}{T1}{3}
489 \DeclareTextAccent{"}{T1}{4}
490 \DeclareTextAccent{\H}{T1}{5}
491 \DeclareTextAccent{\r}{T1}{6}
492 \DeclareTextAccent{\v}{T1}{7}
493 \DeclareTextAccent{\u}{T1}{8}
494 \DeclareTextAccent{=} {T1}{9}
495 \DeclareTextAccent{.}{T1}{10}
```

Some accents have to be built by hand. Note that \oalign and \o@ign must be inside a group. In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```

496 \DeclareTextCommand{\b}{T1}[1]
497 {\hmode@bgroup\o@ign{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
498 \vbox to .2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
499 \DeclareTextCommand{\c}{T1}[1]
500 {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent11 #1%
501 \else{\oalign{\unhbox\z@\crcr
502 \hidewidth\char11\hidewidth}}\fi}
503 \DeclareTextCommand{\d}{T1}[1]
504 {\hmode@bgroup
505 \o@ign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
506 \DeclareTextCommand{\k}{T1}[1]
507 {\hmode@bgroup\oalign{\null#1\crcr\hidewidth\char12}\egroup}
508 \DeclareTextCommand{\texttoggonekcentered}{T1}[1]
509 {\hmode@bgroup\oalign{%
510 \null#1\crcr\hidewidth\char12\hidewidth}\egroup}
```

Some symbols are constructed.

Slot 24 contains a small circle intended for construction of these two glyphs.

```

511 \DeclareTextCommand{\textperthousand}{T1}
512 {\%\char 24 } % space or ‘relax as delimiter?
513 \DeclareTextCommand{\textpertenthousand}{T1}
514 {\%\char 24\char 24 } % space or ‘relax as delimiter?
```

For Maltese, \Hwithstroke and \hwithstroke are needed.

```
515 \DeclareTextCommand{\Hwithstroke}{T1}
516 {%
517 \hmode@bgroup
518 \vphantom{H}%
519 \sbox{z@{H}}%
520 \ooalign{%
521 H\cr
522 \hidewidth
523 \vrule
524 height \dimexpr 0.7\ht{z@+0.1ex}\relax
525 depth -0.7\ht{z@}
526 width 0.8\wd{z@}
527 \hidewidth\cr
528 }%
529 \egroup
530 }
531 \DeclareTextCommand{\hwithstroke}{T1}
532 {%
533 \hmode@bgroup
534 \vphantom{h}%
535 \sbox{z@{h}}%
536 \ooalign{%
537 h\cr
538 \kern0.075\wd{z@}
539 \vrule
540 height \dimexpr 0.7\ht{z@+0.1ex}\relax
541 depth -0.7\ht{z@}
542 width 0.4\wd{z@}
543 \hidewidth\cr
544 }%
545 \egroup
546 }
```

Declare the text symbols.

```
547 \% \DeclareTextSymbol{\AA}{T1}{197}
548 \DeclareTextSymbol{\AE}{T1}{198}

## 1.7 Definitions for the OMS encoding

The definitions for the ‘ $\mathrm{T}_{\mathrm{E}}\mathrm{X}$  math symbol’ (OMS) encoding. Even though this is meant to be a math font, it includes some of the standard  $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X}$  text symbols.

Declare the encoding.

```

737 {*OMS}
738 \DeclareFontEncoding{OMS}{}{}

```

Declare the symbols. Note that slot 13 has in places been named `\Orb`: please root out and destroy this impurity wherever you find it!

```

739 \DeclareTextSymbol{\textasteriskcentered}{OMS}{3} % "03
740 \DeclareTextSymbol{\textbackslash}{OMS}{110} % "6E
741 \DeclareTextSymbol{\textbar}{OMS}{106} % "6A
742 \DeclareTextSymbol{\textbardbl}{OMS}{107} % "6B
743 \DeclareTextSymbol{\textbraceleft}{OMS}{102} % "66
744 \DeclareTextSymbol{\textbraceright}{OMS}{103} % "67
745 \DeclareTextSymbol{\textbullet}{OMS}{115} % "0F
746 \DeclareTextSymbol{\textdaggerdbl}{OMS}{122} % "7A
747 \DeclareTextSymbol{\textdagger}{OMS}{121} % "79
748 \DeclareTextSymbol{\textparagraph}{OMS}{123} % "7B
749 \DeclareTextSymbol{\textperiodcentered}{OMS}{1} % "01
750 \DeclareTextSymbol{\textsection}{OMS}{120} % "78
751 \DeclareTextSymbol{\textbigcircle}{OMS}{13} % "0D
752 \DeclareTextCommand{\textcircled}{OMS}[1]{\hmode@bgroup
753 \oalign{%
754 \hfil \raise .07ex\hbox {\upshape#1}\hfil \crcr
755 \char 13 % "0D
756 }%
757 \egroup}
758
```

## 1.8 Definitions for the OML encoding

The definitions for the ‘TEX math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard LATEX text symbols.

Declare the encoding.

```

759 <*OML>
760 \DeclareFontEncoding{OML}{}{}

```

Declare the symbols.

```

761 \DeclareTextSymbol{\textless}{OML}{`<}
762 \DeclareTextSymbol{\textgreater}{OML}{`>}
763 \DeclareTextAccent{\t}{OML}{127} % "7F
764
```

## 1.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘TEX text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The LATEX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources <ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip>;

Font files <ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip>.

Declare the encoding.

```

765 <*OT4>
766 \DeclareFontEncoding{OT4}{}{}
767 \DeclareFontSubstitution{OT4}{cmr}{m}{n}

```

Declare the accents.

```
768 \DeclareTextAccent{"}{OT4}{127}
769 \DeclareTextAccent{'}{OT4}{19}
770 \DeclareTextAccent{.}{OT4}{95}
771 \DeclareTextAccent{=}{OT4}{22}
772 \DeclareTextAccent{^}{OT4}{94}
773 \DeclareTextAccent{'`}{OT4}{18}
774 \DeclareTextAccent{'-}{OT4}{126}
775 \DeclareTextAccent{'H}{OT4}{125}
776 \DeclareTextAccent{'u}{OT4}{21}
777 \DeclareTextAccent{'v}{OT4}{20}
778 \DeclareTextAccent{'r}{OT4}{23}
```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```
779 \DeclareTextCommand{\k}{OT4}[1]{%
780 \TextSymbolUnavailable{\k{#1}}#1}
```

In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```
781 \DeclareTextCommand{\b}{OT4}[1]{%
782 \hmode@bgroup\o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
783 \vbox to .2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
784 \DeclareTextCommand{\c}{OT4}[1]{%
785 {\leavevmode\setbox\z@\hbox{\ifdim\ht\z@=1ex\accent24 #1%
786 \else\ooalign{\unhbox\z@\crcr\hidewidth\char24\hidewidth}\fi}}
787 \DeclareTextCommand{\d}{OT4}[1]{%
788 \hmode@bgroup
789 \o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
```

## 1.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package `fontspec` as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted from the `inputenc` UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to L<sup>A</sup>T<sub>E</sub>X L<sup>I</sup>C<sup>R</sup> commands.

A few additional names for character which were supported in the original `fontspec` version of this file have also been added, even though they are not currently in the default `inputenc` UTF-8 declarations.

```
1002 (*TU)
```

In the base interface the Unicode encoding is always known as TU. But we parameterize the encoding name to allow for modelling differences in Unicode support by different fonts.

```

1003 \providetoken{\UnicodeEncodingName{TU}}
As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we
detect these engines first, and make adjustments for the differing font loading syntax.
For other engines, we issue a warning then abort this file, switching back to T1 encoding.
1004 \begingroup\expandafter\expandafter\expandafter\endgroup
1005 \expandafter\ifx\csname XeTeXrevision\endcsname\relax
1006 \begingroup\expandafter\expandafter\expandafter\endgroup
1007 \expandafter\ifx\csname directlua\endcsname\relax

```

Not LuaTeX or XeTeX, abort with a warning.

```

1008 \PackageWarningNoLine{fontenc}
1009 {\UnicodeEncodingName\space
1010 encoding is only available with XeTeX and LuaTeX.\MessageBreak
1011 Defaulting to T1 encoding}

```

```

1012 \def\encodingdefault{T1}
1013 \expandafter\expandafter\expandafter\endinput
1014 \else
```

LuaTeX. For LuaTeX 1.10+, define a Lua function to disable any handing by the font code. Otherwise we reload the font without TeX ligatures.

```

1015 \def\UnicodeFontTeXLigatures{+tlig;}
1016 \ifnum\luatexversion<110
1017 \def\reserved@a#1{%
1018 \def\@remove@tlig##1{\@remove@tlig##1\@nil#1\@nil\relax}
1019 \def\@remove@tlig##1#1{\@remove@tlig@##1}
1020 \edef\reserved@b{\detokenize{+tlig;}}
1021 \expandafter\reserved@a\expandafter{\reserved@b}
1022 \def\@remove@tlig@@#1\@nil#2\relax{#1}
1023 \def\remove@tlig#1{%
1024 \begingroup
1025 \font\remove@tlig
1026 \expandafter\@remove@tlig\expandafter{\fontname\font}%
1027 \remove@tlig
1028 \char#1\relax
1029 \endgroup
1030 }
1031 \else
1032 \newprotectedluacmd\@remove@tlig@@@
```

Now we can define the function. Mostly we just have to insert a protected glyph node, which is a glyph node with subtype 256. But we have to keep track of the current mode to avoid inserting the glyph into a vlist.

```

1033 \now@and@everyjob{\directlua{
1034 local rawchar_func = token.create'\@remove@tlig@@@'.index
1035 local forcehmode = tex.forcehmode
1036 local put_next = token.put_next
1037 local glyph_id = node.id'glyph'
1038 local rawchar_token = token.new(rawchar_func, token.command_id'lua_call')
1039 lua.get_functions_table()[rawchar_func] = function()
1040 local mode = tex.nest.top.mode
1041 if mode == 1 or mode == -1 then
1042 put_next(rawchar_token)
1043 return forcehmode(true)
1044 end
1045 local n = node.new(glyph_id, 256)
1046 n.font = font.current()
1047 n.char = token.scan_int()
1048 return node.write(n)
1049 end
1050 }}
```

Now `\remove@tlig` can be implemented almost as in XeTeX.

```

1051 \def\remove@tlig#1{\@remove@tlig@@@#1\relax}
1052 \fi
1053 \fi
1054 \else
```

## XeTeX

```

1055 \def\UnicodeFontTeXLigatures{mapping=tex-text;}
1056 \def\remove@tlig#1{\XeTeXglyph\numexpr\XeTeXcharglyph#1\relax}
1057 \fi
1058 \def\UnicodeFontFile#1#2{"[#1]:#2"}
1059 \def\UnicodeFontName#1#2{"#1:#2"}

 Declare the encoding
1060 \DeclareFontEncoding\UnicodeEncodingName{}{}

 Declare accent command to use a postspended combining character rather than the
TeX \accent primitive
1061 \def\add@unicode@accent#1#2{%
1062 \if\relax\detokenize{#2}\relax^\^a0\else#2\fi
1063 \char#1\relax}

 In its original implementation \DeclareUnicodeAccent was given 3 arguments (with
second the “Unicode encoding” a.k.a., \UnicodeEncodingName) while in other places,
e.g., \DeclareUnicodeComposite, we always made encoding implicit. So we now change
it here to implicit too so that the interfaces become a bit more consistent. To avoid
making that a breaking change (even though it only affects two packages on CTAN)
we test for #2 being \UnicodeEncodingName. This would not catch if somebody used
\DeclareUnicodeAccent{\=}{TU-sub}{“0304} but that fortunately hasn’t happened.
With the implicit argument you would need to change \UnicodeEncodingName instead,
as you have to do anyway for the other interface commands.
1064 \def\DeclareUnicodeAccent#1#2{%
1065 \edef\reserved@a{#2}%
1066 \edef\reserved@b{\UnicodeEncodingName}%
1067 \ifx\reserved@a\reserved@b

Unfortunately some fonts do not implement "2011, "2012 and/or "2015 (including the

$\text{\LaTeX}$  default fonts for Unicode engines) so we provide some approximations if the glyph is missing, like we do for OT1 and T1.

The `\nobreak\hspace{z@}` is there to prevent a break after the hyphen but allow later breaks in the remainder of the word.

```
1186 \DeclareUnicodeCommand{\textnonbreakinghyphen}

## 2 Package files

This file now also contains some packages that provide access to the more specialised encodings.

### 2.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding `FOO`, the package looks to see if the encoding `FOO` has already been declared. If it has not, the file `fooencl.def` is loaded. The default encoding is set to be `FOO`.

In addition the package at the moment contains extra code to extend the `\@uclclist` (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```
1526 <*package>
```

Here we define a macro that extends the `\@uclclist` if needed and afterwards turns itself in a noop.

```

1527 \def\update@uclc@with@cyrillic{%

1553 \CYRYU\cyryu\CYRYU\cyrz\CYRZ\cyrdsc\CYRZDESC\cyrzch\CYRZH
1554 \cyrzhdsc\CYRZHDSC}%
1555 \let\update@uclc@with@cyrillic\relax
1556 }

```

Here we process each option:

```

1557 \DeclareOption*{%
1558 \let\encodingdefault\CurrentOption

```

From 2020/02/02 release onward we only load the encoding files if they haven't be loaded already. To check this we look at whether `\T@encoding` is already defined. If not, we load it later (indicated by setting the switch `@tempswa` to true) and we always load if we are using an older format (or rather in a rollback situation).

```

1559 \@tempswafalse
1560 \@ifl@t@r\fmtversion{2020/02/02}{%
1561 \expandafter\ifx\csname T@\CurrentOption\endcsname\relax
1562 \@tempswatrue\fi}%
1563 {\@tempswatrue}%

```

Load if necessary:

```

1564 \if@tempswa
1565 \edef\reserved@f{%
1566 \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}}%
1567 \reserved@f
1568 \InputIfFileExists\reserved@f
1569 {}{\PackageError{fontenc}%
1570 {Encoding file '\reserved@f' not found.%}
1571 \MessageBreak
1572 You might have misspelled the name of the encoding
1573 \MessageBreak
1574 or a required support package (e.g., cyrillic) is
1575 \MessageBreak
1576 missing in your installation}%

```

```

1577 {Necessary code for this encoding was not
1578 loaded.\MessageBreak
1579 Thus calling the encoding later on will
1580 produce further error messages.} }%
1581 \let\reserved@f\relax

```

In case the current encoding is one of a list of known cyrillic ones we extend the `\@uclclist`:

```

1582 \expandafter\in@\expandafter{\CurrentOption}%
1583 {T2A,T2B,T2C,X2,LCY,OT2}%
1584 \ifin@

```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the `\@uclclist` gets unnecessarily big, slowing down the processing at runtime.

```

1585 \expandafter\in@\expandafter\cyra\expandafter
1586 { \@uclclist } %
1587 \ifin@
1588 \else
1589 \update@uclc@with@cyrillic
1590 \fi
1591 \fi
1592 \fi
1593 }
1594 \ProcessOptions*

```

We select the new font encoding default (i.e., the last encoding specified in the option list). But this encoding may not work with the current `\f@shape`: e.g., LY1 is not defined for `cmr` and therefore packages switching to LY1 usually also change `\rmdefault`. But that only applies at `\begin{document}` so we get a spurious warning if we use what L<sup>A</sup>T<sub>E</sub>X previously used:

```
1595 \%fontencoding\encodingdefault\selectfont
```

So instead we do this here:

```
1596 \usefont\encodingdefault\familydefault\seriesdefault\shapedefault
```

To save some space we get rid of the macro extending the `\@uclclist` (might have happened already).

```
1597 \let\update@uclc@with@cyrillic\relax
```

Finally we pretend that the fontenc package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```

1598 \let\@elt\relax
1599 \xdef\@fontenc@load@list{\@fontenc@load@list
1600 \@elt{\csname opt@fontenc.sty\endcsname}}
1601 \global\expandafter\let\csname ver@@fontenc.sty\expandafter\endcsname
1602 \csname ver@fontenc.sty\endcsname
1603 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
1604 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
1605 \global\let\@ifl@ter@@\@ifl@ter
1606 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@}
1607
```

## File 22

# ltcounts.dtx

### 1 Counters and Lengths

Commands for defining and using counters. This file defines the following commands. In each case  $\{<\text{counter}>\}$  may be \* denoting the current counter as set by a previous  $\text{\refstepcounter}$ .

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $\text{\newcounter}$     | To define a new counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| $\text{\setcounter}$     | To set the value of counters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| $\text{\addtocounter}$   | Increase the $\{<\text{counter}>\}$ #1 by the number #2.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| $\text{\stepcounter}$    | Increase the $\{<\text{counter}>\}$ by one.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| $\text{\refstepcounter}$ | Increase the $\{<\text{counter}>\}$ by one, also setting the value used by $\text{\label}$ .                                                                                                                                                                                                                                                                                                                                                                                                      |
| $\text{\value}$          | For accessing the value of the counter as a T <sub>E</sub> X number (as opposed to $\text{\the}\{<\text{counter}>\}$ ) which expands to the <i>printed</i> representation of $\{<\text{counter}>\}$                                                                                                                                                                                                                                                                                               |
| $\text{\arabic}$         | $\text{\arabic}\{<\text{counter}>\}$ : 1, 2, 3, ...                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Star form omits redefining the print representation.                                           |
| $\text{\counterwithout}$ | The * alias for the current counter may not be used in either argument.<br>$\text{\counterwithout}\{<\text{format}>\}\{<\text{counter}>\}\{<\text{within-counter}>\}$ : Removes $\{<\text{counter}>\}$ from the reset list of $\{<\text{within-counter}>\}$ . Also redefines $\text{\the}\{<\text{counter}>\}$ command to produce $\{<\text{format}>\}\{<\text{counter}>\}$ with $\text{\arabic}$ as the default for $\{<\text{format}>\}$ . Star form omits redefining the print representation. |

The \* alias for the current counter may not be used in either argument.

<sup>1</sup>  $\{<2\text{ekernel}>\}$

#### 1.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

|                      |                                                                                                                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\c@foo</code>  | Contains the counter's numerical value. It is defined by <code>\newcount\foocounter</code> .                                                                                                                                                                                                                                          |
| <code>\thefoo</code> | Macro that expands to the printed value of <code>\foocounter</code> . For example, if sections are numbered within chapters, and section headings look like                                                                                                                                                                           |
|                      | Section II-3. The Nature of Counters                                                                                                                                                                                                                                                                                                  |
|                      | then <code>\thesection</code> might be defined by:                                                                                                                                                                                                                                                                                    |
|                      | <code>\def\thesection</code><br><code>{\@Roman{\c@chapter}-\@arabic{\c@section}}</code>                                                                                                                                                                                                                                               |
| <code>\p@foo</code>  | Macro that expands to a printed 'reference prefix' of counter <code>foo</code> . Any <code>\ref</code> to a value created by counter <code>foo</code> will produce the expansion of <code>\p@foo\thefoo</code> when the <code>\label</code> command is executed. See file <code>ltxref.dtx</code> for an extension of this mechanism. |
| <code>\cl@foo</code> | List of counters to be reset when <code>foo</code> stepped. Has format <code>\@elt{counterA}\@elt{counterB}\@elt{counterC}</code> .                                                                                                                                                                                                   |

**NOTE:**

`\thefoo` and `\p@foo` *must* be defined in such a way that `\edef\bar{\thefoo}` or `\edef\bar{\p@foo}` defines `\bar` so that it will evaluate to the counter value at the time of the `\edef`, even after `\foocounter` and any other counters have been changed. This will happen if you use the standard commands `\@arabic`, `\@Roman`, etc.

The following commands are used to define and modify counters.

`\refstepcounter{<foo>}`

Same as `\stepcounter`, but it also defines `\@currentlabel`, `\@currentHref` and `\@currentcounter` and so that a subsequent `\label{<bar>}` command causes `\ref{<bar>}` to generate the current value of counter `<foo>`.

`\@definecounter{<foo>}`

Initializes counter `{<foo>}` (with empty reset list), defines `\p@foo` and `\thefoo` to be null and `\theHfoo` to be `\number\value{foo}`. Also adds `<foo>` to `\cl@ckpt` – the reset list of a dummy counter `@ckpt` used for taking checkpoints for the `\include` system.

`\@addtoreset{<foo>}{<bar>}` : Adds counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\@removefromreset{<foo>}{<bar>}` : Removes counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\setcounter` `\setcounter{<foo>}{{<val>}}` : Globally sets `\foocounter` equal to `<val>`.

```

2 \def\setcounter#1#2{%
3 \@ifundefined{c@#1}%
4 {\@nocounterr{#1}}%
5 {\global\csname c@#1\endcsname#2\relax}}

```

(End of definition for `\setcounter`.)

`\addtocounter` `\addtocounter{<foo>}{{<val>}}` Globally increments `\foocounter` by `<val>`.

```

6 \def\addtocounter#1#2{%
7 \@ifundefined{c@#1}%
8 {\@nocounterr{#1}}%
9 {\global\advance\csname c@#1\endcsname #2\relax}}

```

(End of definition for `\addtocounter`.)

\newcounter \newcounter{\*newctr*}[\*oldctr*] Defines *newctr* to be a counter, which is reset when counter *oldctr* is stepped. If *newctr* already defined produces ‘c@*newctr* already defined’ error.

```

10 \def\newcounter#1{%
11 \expandafter\ifdefined \csname c@#1\endcsname
12 {\@definecounter{#1}}%
13 \@ifnextchar[{\@newctr{#1}}{}}

```

(End of definition for \newcounter.)

\value \value{\*ctr*} produces the value of counter *ctr*, for use with a \setcounter or \addtocounter command.

```

14 \def\value#1{\csname c@#1\endcsname}

```

(End of definition for \value.)

\c@\* Make the current counter available as a L<sup>A</sup>T<sub>E</sub>X counter with name \*, so \alph\* returns the current counter as a letter, \stepcounter{\*} increments the current counter, etc.

```

15 \protected\expandafter
16 \def\csname c@*\endcsname{\value\currentcounter}

```

(End of definition for \c@\*.)

\@newctr

```

17 \def@\newctr#1[#2]{%
18 \ifundefined{c@#2}{\nocounterr{#2}}{\addtoreset{#1}{#2}}}

```

(End of definition for \@newctr.)

\stepcounter \stepcounterfoo Globally increments counter \c@FOO and resets all subsidiary counters.

```

19 \def\stepcounter#1{%
20 \addtocounter{#1}\one
21 \begingroup
22 \let\elt\stpeilt
23 \csname cl@#1\endcsname
24 \endgroup}

```

(End of definition for \stepcounter.)

\@stpeilt Rather than resetting the “within” counter to zero we set it to -1 and then run \stepcounter that moves it to 0 and also initiates resetting the next level down.

\@addtoreset If a counter is reset when a parent counter changes it no longer has an unique value across the document. As \theH<counter> should be unique this representation is changed to include also the representation of the parent. This is not 100% guaranteed to work but has been used this way by hyperref for many years without causing problems.

212 Y\or Z\else\@ctrerr\fi}
```

(End of definition for \@Alph.)

\@fnsymbol Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.

This macro is another example of an ever recurring problem in TEX: Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an \edef or \write where an \ifmmode test would be executed prematurely. Hence in the implementation below, \@fnsymbol is not robust in itself but the parts doing the actual typesetting are.

In the case of \@fnsymbol we make use of the robust command \TextOrMath which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a \relax token if run under regular TEX, which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use eTEX as engine for LATEX (as recommended) this unfortunate side effect is not present.

```

213 </2ekernel>
214 <|latexrelease>\IncludeInRelease{2015/01/01}{\@fnsymbol}{Use \TextOrMath}%
215 <*2ekernel | latexrelease>
216 \def\@fnsymbol#1{%

235 <|latexrelease>\EndIncludeInRelease
236 <*2ekernel>
```

(*End of definition for \@fnsymbol.*)

\TextOrMath When using regular TEX, we make this command robust so that it always selects the correct branch in an \ifmmode switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic \IeC from inputenc but then it will have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell. However, users of eTEX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eTEX but making sure not to permanently turn \protected into \relax.

```

237 </2ekernel>
238 <|latexrelease>\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
239 <*2ekernel | latexrelease>
```

```
240 \begingroup\expandafter\expandafter\expandafter\endgroup
241 \expandafter\ifx\csname protected\endcsname\relax
```

In case of ordinary TEX we define `\TextOrMath` as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```
242 \DeclareRobustCommand\TextOrMath{%
243 \ifmmode \expandafter\@secondoftwo
244 \else \expandafter\@firstoftwo \fi}
245 \protected@edef\TextOrMath{\TextOrMath{\#1}{\#2}}
246 \else
```

For eTEX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```
247 \protected\expandafter\def\csname TextOrMath\space\endcsname{%
248 \ifmmode \expandafter\@secondoftwo
249 \else \expandafter\@firstoftwo \fi}
250 \edef\TextOrMath{\TextOrMath{\#1}{\#2}{%
251 \expandafter\noexpand\csname TextOrMath\space\endcsname
252 {\#1}{\#2}}}
253 \fi
254 </2ekernel | latexrelease>

36 〈/2ekernel〉

```

(*End of definition for \@settopoint.*)

## File 24

# ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of the L<sup>A</sup>T<sub>E</sub>X ‘New’ Font Selection Scheme.

**Warning:** The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

### 1 Preliminary macros

We define a number of macros that will be used later.

```
1 {*2ekernel}
2 \message{NFSS base,}
```

\@nomath \@nomath is used by most macros that will have no effect in math mode. It issues a warning message.

```
3 \def\@nomath#1{\relax\ifmmode
4 \font@warning{Command \noexpand#1 invalid in math mode}\fi}
```

(End of definition for \@nomath.)

\no@alphabet@error The macro \no@alphabet@error is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The \relax at the beginning is necessary to prevent T<sub>E</sub>X from scanning too far in certain situations.

```
5 \gdef\no@alphabet@error#1{\relax \ifmmode
6 \@latex@error{Math\space alphabet\space identifier\space
7 \noexpand#1 is\space undefined\space in\space math\space
8 version\space ‘\math@version’}%
9 {Your\space requested\space math\space alphabet\space
10 is\space undefined\space in\space the\space current\space
11 math\space version.^^JCheck\space the\space spelling\space
12 or\space use\space the\space \noexpand\SetMathAlphabet\space
13 command.}%
14 }
```

(End of definition for \no@alphabet@error.)

\new@mathgroup \mathgroup We also give a new name to \newfam and \fam to avoid verbal confusion (see the introduction).<sup>32</sup>

```
15 \%def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@n}
16 \let\mathgroup\fam
17 \%let\newfam\new@mathgroup
18 \onlypreamble\new@mathgroup
```

(End of definition for \new@mathgroup and \mathgroup.)

<sup>32</sup>For the same reason it seems advisable to \let\fam and \newfam equal to \relax, but this is commented out to retain compatibility to existing style files.

## 2 Macros for setting up the tables

```
\DeclareFontShape{The macro \DeclareFontShape takes 6 arguments:
19 \def\DeclareFontShape{\begingroup
First we restore the catcodes of all characters used in the syntax.
20 \nfss@catcodes
We use \expandafter \endgroup to restore catcode in case something goes wrong with
the argument parsing (suggested by Tim Van Zandt)
21 \expandafter\endgroup
22 \DeclareFontShape{
(End of definition for \DeclareFontShape.)}
```

```
\DeclareFontShape@
23 {/2ekernel}
24 {*2ekernel | latexrelease}
25 {latexrelease}\IncludeInRelease{2020/02/02}{%
26 {latexrelease} {\DeclareFontShape@}{Maybe drop one m}{%
27 \def\DeclareFontShape@#1#2#3#4#5#6{
28 \expandafter\ifx\csname #1#2\endcsname\relax
29 \@latex@error{Font family '#1#2' unknown}\@eha
30 \else
31 \edef\reserved@a{#3}{%
```

If the series value is incorrectly specified with an extra “m”, e.g., “mc” instead of just “c”, drop the surplus “m” but keep the “m” if it is by its own. In that case also issue a warning that the declaration needs correction.

For this we compare the given value #3 with one where we may have dropped an “m”. If nothing has changes, fine. Otherwise there was a wrong value which is now corrected in \reserved@b so we use that and also issue a warning.

```
31 \series@maybe@drop@one@m\reserved@a\reserved@b
32 \ifx\reserved@a\reserved@b\else
33 \@latex@note{Font shape #1/#2/#3/#4 has incorrect series
34 value '#3'.\MessageBreak It should not contain an 'm'!
35 Please correct it.\MessageBreak Found}-%
36 \fi
37 \expandafter
38 \xdef\csname#1/#2/\reserved@b/#4\endcsname
39 {\expandafter\noexpand\csname #5\endcsname}-%
40 %
```

Most of the time #6 is empty so using \let to \empty saves on space compared to using \def. That’s really one of the old space saving techniques and probably not necessary these days.

```
42 \def\reserved@a{#6}{%
43 \global
44 \expandafter\let\csname#5\expandafter\endcsname
45 \ifx\reserved@a\empty
46 \empty
47 \else
48 \reserved@a
49 \fi
50 \fi
51 }
```

```

52 </2ekernel | latexrelease>
53 <latexrelease>\EndIncludeInRelease
54 <latexrelease>\IncludeInRelease{0000/00/00}%
55 <latexrelease> {\DeclareFontShape@}{Maybe drop one m}%
56 <latexrelease>
57 <latexrelease>\def\DeclareFontShape@#1#2#3#4#5#6{%
58 <latexrelease> \expandafter\ifx\csname #1#2\endcsname\relax
59 <latexrelease> \@latex@error{Font family '#1+#2' unknown}\@eha
60 <latexrelease> \else
61 <latexrelease> \expandafter
62 <latexrelease> \xdef\csname#1/#2/#3/#4\endcsname{\expandafter\noexpand
63 <latexrelease> \csname #5\endcsname}%
64 <latexrelease> \def\reserved@a{#6}%
65 <latexrelease> \global
66 <latexrelease> \expandafter\let\csname#5\expandafter\endcsname
67 <latexrelease> \ifx\reserved@a\empty
68 <latexrelease> \empty
69 <latexrelease> \else
70 <latexrelease> \reserved@a
71 <latexrelease> \fi
72 <latexrelease> \fi
73 <latexrelease> }
74 <latexrelease>\EndIncludeInRelease
75 <*2ekernel>

```

(End of definition for `\DeclareFontShape@`.)

`\DeclareFixedFont` Define a direct font switch that avoids all overhead.

```

76 \def\DeclareFixedFont#1#2#3#4#5#6{%
77 \begingroup
78 \math@fontsfalse
79 \every@math@size{}%
80 \fontsize{#6}\z@
81 \usefont{#2}{#3}{#4}{#5}%
82 \global\expandafter\let\expandafter#1\the\font
83 \endgroup
84 }

```

(End of definition for `\DeclareFixedFont`.)

`\do@subst@correction`

```

85 \def\do@subst@correction{%
86 \xdef\subst@correction{%
87 \font@name
88 \global\expandafter\font
89 \csname \curr@fontshape/\f@size\endcsname
90 \noexpand\fontname\font
91 \relax}%

```

Calling `\subst@correction` after the current group means calling it after we have loaded the substitution font which is done inside a group.

```

92 \aftergroup\subst@correction
93 }

```

(End of definition for `\do@subst@correction`.)

```
\DeclareFontFamily
```

```
94 \def\DeclareFontFamily#1#2#3{%
```

If we want fast checking for the encoding scheme we can just check for `\T@..` being defined.

```
95 % \@tempswafalse
96 % \def\reserved@b{#1}%
97 % \def\cdp@elt##1##2##3##4{\def\reserved@c{##1}%
98 % \ifx\reserved@b\reserved@c \@tempswatrue\fi}%
99 % \cdp@list
100 % \if@tempswa
101 \ifundefined{T@#1}%
102 {%
103 \@latex@error{Encoding scheme '#1' unknown}\@eha
104 }%
105 {%
```

Now we have to define the macro `\(#1)+(#2)` to contain #3. But since most of the time #3 will be empty we use `\let` in a tricky way rather than a simple `\def` since this will save internal memory. We store the argument #3 in a temporary macro `\reserved@a`.

```
106 \def\reserved@a{#3}%
```

We compare `\reserved@a` with `\empty`. If these two are the same we `\let` the ‘extra’ macro equal to `\empty` which is not the same as doing a `\let` to `\reserved@a` — the latter would blow one extra memory location rather than reusing the one from `\empty`.

```
107 \global
108 \expandafter\let\csname #1+#2\expandafter\endcsname
109 \ifx \reserved@a\empty
110 \empty
111 \else \reserved@a
112 \fi
113 {%
114 }
```

(End of definition for `\DeclareFontFamily`.)

`\cdp@list` We initialize the code page list to be empty.

```
115 \let\cdp@list\empty
116 \onlypreamble\cdp@list
```

(End of definition for `\cdp@list`.)

```
\cdp@elt
```

```
117 \let\cdp@elt\relax
118 \onlypreamble\cdp@elt
```

(End of definition for `\cdp@elt`.)

```
\DeclareFontEncoding
```

```
119 \def\DeclareFontEncoding{%
```

First we start with ignoring all blanks and newlines since every surplus space in the second or third argument will come out in a weird place in the document.

```

120 \begingroup
121 \nfss@catcodes
122 \expandafter\endgroup
123 \DeclareFontEncoding@}
124 \onlypreamble\DeclareFontEncoding

125 \def\DeclareFontEncoding#1#2#3{%
126 \expandafter

```

Keep a record of the last encoding being declared:

```

138 \xdef\LastDeclaredEncoding{#1}%
139 }
140 \onlypreamble\DeclareFontEncoding@
```

*(End of definition for `\DeclareFontEncoding`.)*

`\LastDeclaredEncoding` The last encoding being declared by `\DeclareFontEncoding`.

```
141 \def\LastDeclaredEncoding{}

(End of definition for \LastDeclaredEncoding.)
```

#### `\DeclareFontSubstitution`

```

142 \def\DeclareFontSubstitution#1#2#3#4{%
143 \expandafter
144 \ifx\csname T#1\endcsname\relax
145 \@latex@error{Encoding scheme '#1' unknown}\@eha
146 \else
147 \begingroup
```

We loop through the `\cdp@list` and rebuild it anew in `\toks@` thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in `\reserved@a` since it might just be `\LastDeclaredEncoding` that is passed as #1.

```

148 \edef\reserved@a{#1}%
149 \toks@{%
150 \def\cdp@elt##1##2##3##4{%
151 \def\reserved@b{##1}%
152 \ifx\reserved@a\reserved@b
```

Here we use the new defaults but we use ##1 (i.e., the encoding name already stored previously) since we know that it is expanded.

```

153 \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
154 \else
155 \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
156 \fi}%
157 \cdp@list
158 \xdef\cdp@list{\the\toks@}%
159 \endgroup
160 \global
161 \cnamedef{D@#1}{%
162 \def\default@family{#2}%
163 \def\default@series{#3}%

177 \ifx\default@M\empty\else
178 \@font@info{Overwriting encoding scheme math defaults}%
179 \fi
180 \gdef\default@M{#2}%
181 \fi
182 }
183 \onlypreamble\DeclareFontEncodingDefaults

```

(End of definition for \DeclareFontEncodingDefaults.)

```

\default@T
\default@M
184 \let\default@T\empty
185 \let\default@M\empty

```

(End of definition for \default@T and \default@M.)

\DeclareEncodingSubset The declaration takes 3 mandatory arguments: an *encoding* for which a subsetting is wanted (currently always TS1, and most likely forever), the *font family* for which we declare the subset and finally the *subset* number, with a value between 0 (all of the encoding is supported) and 9 (many glyphs are missing).

For TS1 the numbers have been chosen in a way that most fonts can be fairly correctly categorized, but the default settings are always conservative, that is they may claim that fewer glyphs are supported than there actually are.

As these days many font families are set up to end in -LF (lining figures), -OsF (oldstyle figures), etc. the declaration supports a shortcut: if the *font family* name ends in -\* then the star gets replaced by these common ending, e.g.,

```
\DeclareEncodingSubset{TS1}{Alegreya-*}{2}
```

is the same as writing

```
\DeclareEncodingSubset{TS1}{Alegreya-LF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-OsF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TLF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TOsF}{2}
```

If only some are needed then one can define them individually but in many cases all four are wanted, hence the shortcut.

The coding of the declaration has no error checking as it is mostly for internal use.

```
186 \def\DeclareEncodingSubset#1#2{%
187 \DeclareEncodingSubset@aux{#1}#2*\ DeclareEncodingSubset@aux
188 }
189 \def\DeclareEncodingSubset@aux#1#2#3\DeclareEncodingSubset@aux#4{%
if #3 is empty then there was no star, otherwise we define all four variants.
190 \expandafter\ifx\expandafter X\detokenize{#3}X%
191 \@DeclareEncodingSubset{#1}{#2}{#4}%
192 \else
193 \@DeclareEncodingSubset{#1}{#2LF}{#4}%
194 \@DeclareEncodingSubset{#1}{#2TLF}{#4}%
195 \@DeclareEncodingSubset{#1}{#20sF}{#4}%
196 \@DeclareEncodingSubset{#1}{#2T0sF}{#4}%
197 \fi
198 }
```

The subset info is stored in a command with the name `\family:subset` so if that already exists we change otherwise declare a subset.

```
199 \def\@DeclareEncodingSubset#1#2#3{%
200 \@ifundefined{#1:#2}%
201 {\@font@info{Setting #2 sub-encoding to #1/#3}}%
202 {\@font@info{Changing #2 sub-encoding to #1/#3}}%
```

This declaration should be usable in .fd files and therefore has to make its definition globally, because such files can get loaded in random places.

```
203 \global\@namedef{#1:#2}{#3}
```

(End of definition for `\DeclareEncodingSubset`.)

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs `#3#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions in `lttextcomp.dtx`.

```
\DeclarePreloadSizes
```

```
248 \def\DeclarePreloadSizes#1#2#3#4#5{%
249 \ifundefined{T@#1}%
250 {\@latex@error{Encoding scheme '#1' unknown}\@eha}%
251 }%
```

Don't know at the moment what this group here does!

```
252 \begingroup
```

We define a macro `\reserved@f`<sup>33</sup> that grabs the next *size* and loads the corresponding font. This is done by delimiting `\reserved@f`'s only argument by the *token*, (comma).

```
253 \def\reserved@f##1,{%
```

The end of the list will be detected when there are no more elements, i.e. when `\reserved@f`'s argument is empty. The trick used here is explained in Appendix D of the *TeXbook*: if the argument is empty the `\if` will select the first clause and `\let \reserved@f equal to \relax`. (We use the `>` character here since it cannot appear in font file names.)

```
254 \if>##1%
255 \let\reserved@f\relax
256 \else
```

Otherwise, we define `\font@name` appropriately and call `\pickup@font` to do the work. Note that the requested `\curr@fontshape` combination must have been defined, or you will get an error. The definition of `\font@name` is carried out globally to be consistent with the rest of the code in this file.

```
257 \xdef\font@name{\csname#1/#2/#3/#4/#1\endcsname}%
258 \pickup@font
```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to `\relax`. This means that later on, when the font is first used, the macro `\define@newfont` is called again to execute the 'extra' macro for this font.

```
259 \global\expandafter\let\font@name\relax
260 \fi
```

Finally we call `\reserved@f` again to process the next *size*. If `\reserved@f` was `\let` equal to `\relax` this will end the macro.

```
261 \reserved@f}%
```

We finish with reinserting the list of sizes after the `\reserved@f` macro and appending an empty element so that the end of the list is recognized properly.

```
262 \reserved@f#5,%
263 \endgroup
264 }%
265 }
266 \onlypreamble\DeclarePreloadSizes
```

(End of definition for `\DeclarePreloadSizes`.)

`\ifmath@fonts` We need a switch to decide if we have to switch math fonts. For this purpose we provide `\ifmath@fonts` that can be set to true or false by the `\S@...` macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

```
267 \newif\ifmath@fonts \math@fontstrue
```

---

<sup>33</sup>We cannot use `\@tempa` since it is needed in `\pickup@font`.

(End of definition for `\ifmath@fonts`.)

`\DeclareMathSizes` `\DeclareMathSizes` takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right `\S@...` macro.

## 3 Selecting a new font

### 3.1 Macros for the user

\fontencoding  
\f@encoding

As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros \f@family, \f@series, and \f@shape, resp. We use \edef's so that the arguments can also be macros.

```

314 \DeclareRobustCommand\fontencoding[1]{%
315 \expandafter\ifx\csname T#1\endcsname\relax
316 \@latex@error{Encoding scheme '#1' unknown}\@eha
317 \else
318 \edef\f@encoding{\#1}%
319 \ifx\cf@encoding\f@encoding
```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a \selectfont in-between we can save processing by making sure that \enc@update is \relax.

```

320 \let\enc@update\relax
321 \else
```

If current and new encoding differ we define the macro \enc@update to contain all updates necessary at \selectfont time.

```

322 \let\enc@update\@enc@update
323 \fi
324 \fi
325 }
```

(End of definition for \fontencoding and \f@encoding.)

\@enc@update

```
326 \def\@enc@update{%
```

When \@enc@update is executed \f@encoding holds the encoding name for the new encoding and \cf@encoding the name of the last active encoding.

We start by setting the init command for encoding dependent macros to \@changed@cmd.

```

327 \expandafter
328 \let
329 \csname\cf@encoding-\cmd\endcsname
330 \@changed@cmd
```

Then we turn the one for the new encoding to \@current@cmd (see *ltoutenc.dtx* for further explanations).

```

331 \expandafter
332 \let
333 \csname\f@encoding-\cmd\endcsname
334 \@current@cmd
```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```
335 \default@T
336 \csname T\f@encoding\endcsname
```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```
337 \csname D\f@encoding\endcsname
338 \let\enc@update\relax
339 \let\cf@encoding\f@encoding
340 }
```

(End of definition for `\@@enc@update`.)

`\enc@update` The default action in `\selectfont` is to do nothing.

```
341 \let\enc@update\relax
```

(End of definition for `\enc@update`.)

```
\fontfamily
\f@family
\fontseries
\f@series
\fontshape
\f@shape
342 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{\#1}}
343 \% \DeclareRobustCommand\fontseries[1]{\edef\f@series{\#1}}
344 \% \DeclareRobustCommand\fontshape [1]{\edef\f@shape{\#1}}
```

(End of definition for `\fontfamily` and others.)

`\usefont` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

`\fontencoding` needs to do some setup work so we call that, but instead of calling `\fontfamily`, `\fontseries` and `\fontshape` it earlier versions of this code did, we now set `\f@family`, etc. directly. If we would call `\fontseries` or `\fontshape` as it was done in the past, they would now interact with the existing series and shape which is not desired if we intend to use an explicit font shape!

```
345 </2ekernel>
346 <*2ekernel | latexrelease>
347 <latexrelease>\IncludeInRelease{2021/06/01}%
348 <latexrelease> {\usefont}{Force font face}%
349 \DeclareRobustCommand\usefont[4]{\fontencoding{\#1}%
350 \edef\f@family{\#2}%
351 \set@target@series{\#3}%
352 \edef\f@shape{\#4}%

```

Any earlier `\fontseries`, etc. should be canceled and we should switch unconditionally to the requested font face so we drop any code that may have been stored in `\delayed@f@adjustment`.

```
353 \let\delayed@f@adjustment\empty
354 \selectfont
355 \ignorespaces}
356 </2ekernel | latexrelease>
357 <latexrelease>\EndIncludeInRelease
358 <latexrelease>\IncludeInRelease{2020/02/02}%
359 <latexrelease> {\usefont}{Drop m in usefont}%
360 <latexrelease>
361 <latexrelease>\DeclareRobustCommand\usefont[4]{\fontencoding{\#1}%

```

```

362 〈latexrelease〉 \edef\f@family{#2}%
363 〈latexrelease〉 \set@target@series{#3}%
364 〈latexrelease〉 \edef\f@shape{#4}\selectfont
365 〈latexrelease〉 \ignorespaces
366 〈latexrelease〉
367 〈latexrelease〉\EndIncludeInRelease
368 〈latexrelease〉\IncludeInRelease{0000/00/00}%
369 〈latexrelease〉 \usefont{Drop m in usefont}%
370 〈latexrelease〉
371 〈latexrelease〉\DeclareRobustCommand\usefont[4]{\fontencoding{#1}%
372 〈latexrelease〉 \edef\f@family{#2}%
373 〈latexrelease〉 \edef\f@series{#3}%
374 〈latexrelease〉 \edef\f@shape{#4}\selectfont
375 〈latexrelease〉 \ignorespaces
376 〈latexrelease〉
377 〈latexrelease〉\EndIncludeInRelease
378 〈*2ekernel〉

```

(End of definition for `\usefont`.)

**\linespread** The command `\linespread` changes the current `\baselinestretch` by calling `\set@fontsize`. The values for `\f@size` and `\f@baselineskip` will be left unchanged.

```

379 \DeclareRobustCommand\linespread[1]
380 {\set@fontsize{#1}\f@size\f@baselineskip}

```

(End of definition for `\linespread`.)

**\fontsize** We also define a macro that allows to specify a size. In this case, however, we also need the value of `\baselineskip`. As the first argument to `\set@fontsize` we pass the current value of `\baselinestretch`. This will either match the internal value (in which case nothing changes) or it will be an updated value due to a user change of that macro using `\renewcommand`. If we would pass the internal `\f@linespread` such a change would be effectively overwritten by a size change.

```

381 \DeclareRobustCommand\fontsize[2]
382 {\set@fontsize\baselinestretch{#1}{#2}}

```

(End of definition for `\fontsize`.)

**\f@linespread** This macro holds the current internal value for `\baselinestretch`.

```

383 \let\f@family\empty
384 \let\f@series\empty
385 \let\f@shape\empty
386 \let\f@size\empty
387 \let\f@baselineskip\empty
388 \let\f@linespread\empty

```

(End of definition for `\f@linespread`.)

**\cf@encoding**

```

389 \let\f@encoding\empty
390 \let\cf@encoding\empty

```

(End of definition for `\cf@encoding`.)

- \@defaultunits The function \@defaultunits when wrapped around a dimen or skip assignment supplies default units. Usage:
- ```
  \@defaultunits\dimen@=#1pt\relax\@nnil
```
- Note: the \relax is *important*. Other units can be substituted for the ‘pt’ if desired.
- We use \remove@to@nnil as an auxiliary macros for \@defaultunits. It just has to gobble the supplied default unit ‘pt’ or whatever, if it wasn’t used in the assignment.
- ```
391 \def\@defaultunits{\afterassignment\remove@to@nnil}
```
- (End of definition for \@defaultunits.)
- \strip@pt This macro strips the characters pt produced by using \the on a dimen register.
- ```
392 \begingroup
393   \catcode`P=12
394   \catcode`T=12
395   \lowercase{
396     \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@.##2\fi}}
397     \expandafter\endgroup\x
398 \def\strip@pt{\expandafter\rem@pt\the}
```
- (End of definition for \strip@pt and \rem@pt.)
- \mathversion \mathversion takes the math *version* name as argument, defines \math@version appropriately and switches to the font selected forcing a call to \glb@settings if the *version* is known to the system.
- ```
399 \DeclareRobustCommand\mathversion[1]
400 {\@nomath\mathversion
401 \expandafter\ifx\csname mv@\#1\endcsname\relax
402 \@latex@error{Math version '#1' is not defined}\@eha\else
```
- If there has been a frozen math version reset unconditionally to it if we are at \@math@level one, so that in the typical case of one bold symbol within the normal version this doesn’t allocate an additional math alphabet. If the nesting is deeper we do nothing, which means alphabet allocations accumulate until the end of the formula. One could do slightly better but that would mean keeping track of the allocations on all levels severately and this is likely to be overkill in nearly all situations.
- ```
403     \ifcsname mv@\#1\frozen\endcsname
404       \ifnum \@math@level = \one
405         \unconditionally@reset@math@version {#1}%
406       \fi
407       \fi
408     \edef\math@version{#1}%

```
- We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting \glb@currsize to an invalid value since this will trigger the setup when the formula starts.
- ```
409 \gdef\glb@currsize{}%
```

When the scope of the current `\mathversion` ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is to do the setting only if the version really has changed after all. This might be interesting in case of `amstext` and `boldsymbol`.

```
410 \aftergroup\glb@settings
411 \fi}
```

Resetting the math version unconditionally means that we have to copy the frozen version to `\mv@#1` and also reset the counter `\c@mv@#1` to the number of math alphabets allocated in the frozen version.

```
412 \ExplSyntaxOn
413 \cs_new_protected:Npn \unconditionally@reset@math@version #1 {
414 \cs_gset_eq:cc { mv@#1 }{ mv@#1@frozen }
415 \int_gset:cn { c@mv@#1 }{ \tl_use:c {g__nfss_frozen_mv_ #1 _tl} }
416 }
417 \ExplSyntaxOff
```

*(End of definition for `\mathversion` and `\math@version`.)*

If `TeX` would support a hook just before the end of a formula (opposite of `\everymath` so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in `LATEX` the use of `$` (as the primitive `TeX` command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a `$` couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct `TeX` function must be hidden.

Anyway, since we don't have this and won't have it in `LATEX 2E` we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks `\everymath` and `\everydisplay`. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

`\frozen@everymath` New internal names for `\everymath` and `\everydisplay`.  
`\frozen@everydisplay`

```
418 \let\frozen@everymath\everymath
419 \let\frozen@everydisplay\everydisplay
```

*(End of definition for `\frozen@everymath` and `\frozen@everydisplay`.)*

`\everymath` Now we provide now user hooks that will be called in the frozen internals.  
`\everydisplay`

```
420 \newtoks\everymath
421 \newtoks\everydisplay
```

*(End of definition for `\everymath` and `\everydisplay`.)*

`\@math@level` This counter records the nesting level of math within math.

```
422 \newcount\@math@level
```

*(End of definition for `\@math@level`.)*

`\frozen@everydisplay` Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook.

The check code may push tokens after the math formula with `\aftergroup` and they would prevent a `$$` from dropping following spaces. We therefore use a switch to be set as the first thing after the group so that following code can determine if there was a display or some inline math (in the latter case we better not drop spaces). After setting the switch we also have to place `\ignorespaces` because setting the switch may be the only thing that happens after the display. The issue with handling of spaces was found in 2022, but it is really a bug fix for the code added in 2021/11.

```
423 </2ekernel>
424 <latexrelease>\IncludeInRelease{2021/11/15}
425 <latexrelease> {\frozen@everydisplay}{Handle spaces after math}%
426 {*2ekernel | latexrelease}
427 \frozen@everydisplay = {%
428 \aftergroup\@ignoretrue \aftergroup\ignorespaces}
```

Record that we entered another math level.

```
429 \advance\@math@level\@ne
430 \check@mathfonts
431 \the\everydisplay}
```

(*End of definition for `\frozen@everydisplay`.*)

`\frozen@everymath` The frozen code for inline math is similar, except that here we do not want to drop following spaces.

```
432 \frozen@everymath = {%
433 \aftergroup\@ignorefalse}
```

Record that we entered another math level.

```
434 \advance\@math@level\@ne
435 \check@mathfonts
436 \the\everymath}
```

(*End of definition for `\frozen@everymath`.*)

```
437 </2ekernel | latexrelease>
438 <latexrelease>\EndIncludeInRelease
439 <latexrelease>\IncludeInRelease{2020/10/01}
440 <latexrelease> {\frozen@everydisplay}{Handle spaces after math}%
441 <latexrelease>
442 <latexrelease>\frozen@everydisplay = {\check@mathfonts
443 <latexrelease> \the\everydisplay}
444 <latexrelease>\frozen@everymath = {\check@mathfonts
445 <latexrelease> \the\everymath}
446 <latexrelease>
447 <latexrelease>\EndIncludeInRelease
448 {*2ekernel}
```

`\curr@math@size` This holds locally the current math size.

```
449 \let\curr@math@size\empty
```

(*End of definition for `\curr@math@size`.*)

### 3.2 Macros for loading fonts

- \pickup@font The macro \pickup@font which is used in \selectfont is very simple: if the font name is undefined (i.e. not known yet) it calls \define@newfont to load it.
- ```

450 \def\pickup@font{%
451   \expandafter\ifx\font@name\relax
452     \define@newfont
453   \fi}

```
- (End of definition for \pickup@font.)
- \split@name \pickup@font assumes that \font@name is set but it is sometimes called when \f@family, \f@series, \f@shape, or \f@size may have the wrong settings (see, e.g., the definition of \getanddefine@fonts). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define \split@name which takes the font name as a list of characters of \catcode 12 (without the backslash at the beginning) delimited by the special control sequence \nil. This is not very complicated: we first ensure that / has the right \catcode
- ```

454 {\catcode`/=12

```
- and define \split@name so that it will define our private \f@encoding, \f@family, \f@series, \f@shape, and \f@size macros.
- ```

455 \gdef\split@name#1/#2/#3/#4/#5\@nil{%
456   \def\f@family{#2}%
457   \def\f@series{#3}%
458   \def\f@shape{#4}%
459   \def\f@size{#5}}

```
- (End of definition for \split@name.)
- \curr@fontshape Abbreviation which may get removed again for speed.
- ```

460 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}

```
- (End of definition for \curr@fontshape.)
- \define@newfont Now we can tackle the problem of defining a new font.
- ```

461 \def\define@newfont{%

```
- We have already mentioned that the token list that \split@name will get as argument must not start with a backslash. To reach this goal we will set the \escapechar to -1 so that the \string primitive will not generate an escape character. To keep this change local we open a group. We use \begingroup for this purpose since \define@newfont might be called in math mode, and an empty \bgroup...\egroup would add an empty Ord atom to the math list and thus affect the spacing.
- Also locally redefine \typeout so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.
- ```

462 \begingroup
463 \let\typeout\@font@info
464 \escapechar\m@ne

```
- Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four \expandafter’s so that \font@name is expanded first, then \string, and finally \split@name.
- ```

465   \expandafter\expandafter\expandafter
466     \split@name\expandafter\string\font@name\@nil

```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```

467 %     \expandafter\ifx
468 %         \csname\curr@fontshape\endcsname \relax
469 %             \try@load@fontshape % try always
470 %     \fi
471 %     \expandafter\ifx
472 %         \csname\curr@fontshape\endcsname \relax
473 %             \wrong@fontshape\else

```

To allow substitution we call the `curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```

474 %         \csname\curr@fontshape\endcsname
475 %             \extract@font\fi

```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```

476 \endgroup}

477 \def\try@load@fontshape{%
478     \expandafter
479     \ifx\csname \f@encoding+\f@family\endcsname\relax
480         \font@info{Trying to load font information for
481             \f@encoding+\f@family}%

```

We redefine this combination to be `\empty` which means that next time we don't try again unnecessary in case we don't find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```

482 \global\expandafter\let
483     \csname\f@encoding+\f@family\endcsname\empty

```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```

484 \nfss@catcodes
485 \let\nfss@catcodes\relax

```

For increased portability make the external filename monocase, but look for the (old style) mixed case filename if the first attempt fails.

On any monocase system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```

486 \edef\reserved@a{%
487     \lowercase{%
488         \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}{}}%
489 \reserved@a\relax
490 {\@input{\f@encoding\f@family.fd}}%
491 \fi}

```

(End of definition for `\define@newfont`.)

- \nfss@catcodes** This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```
\expandafter\def\expandafter\nfss@catcodes
  \expandafter{\nfss@catcodes <additional settings>}
```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```
492 \def\nfss@catcodes{%
```

We start by making @ a letter and ignoring all blanks and newlines.

```
493   \makeatletter
494   \catcode`\ 9%
495   \catcode`\\^I9%
496   \catcode`\\^M9%
```

Then we set up \, {, }, # and % in case an .fd file is loaded during a verbatim environment.

```
497   \catcode`\\z@
498   \catcode`{\@ne
499   \catcode`}\@tw@
500   \catcode`\#6%
501   \catcode`\^7%
502   \catcode`\%14%
```

The we make sure that the important syntax parts have the right \catcode.

```
503   \@makeother\<%
504   \@makeother\>%
505   \@makeother\*%
506   \@makeother\.%%
507   \@makeother\-%%
508   \@makeother\/%%
509   \@makeother\[%%
510   \@makeother\]%
511   \@makeother\%
512   \@makeother\%
513   \@makeother\%"%
514 }
```

(End of definition for `\nfss@catcodes`.)

`\LoadFontDefinitionFile` Load and .fd files for some encoding and family (if it exists).

```
515 </2ekernel>
516 <*2ekernel | latexrelease>
517 <latexrelease>\IncludeInRelease{2020/02/02}%
518 <latexrelease>          {\LoadFontDefinitionFile}{Loading .fd files}%
519 \def\LoadFontDefinitionFile#1#2{%
520   \begingroup
521   \edef\f@encoding{#1}%
522   \edef\f@family{#2}%
523   \try@load@fontshape
524   \endgroup
525 }
526 </2ekernel | latexrelease>
527 <latexrelease>\EndIncludeInRelease
528 <latexrelease>\IncludeInRelease{0000/00/00}%
529 <latexrelease>          {\LoadFontDefinitionFile}{Loading .fd files}%
530 <latexrelease>
```

```

532  ⟨\latexrelease⟩\EndIncludeInRelease
533  ⟨*2ekernel⟩

```

(End of definition for \LoadFontDefinitionFile.)

\DeclareFontFamilySubstitution

The idea for this macro is stolen from the `substitutefont` package by Günter Milde, with some modifications and a new name.

Its purpose is to provide characters in a special encoding that are not available in the current font family to be taken from a different family that is visually compatible (or not if you choose badly). For example, you can match the GFS Didot Greek characters with TeX Gyre Pagella (Palatino) by specifying

```
\DeclareFontFamilySubstitution{LGR}{qpl}{udidot}
```

This way if you ask for the LGR encoding in for the qpl family you get the characters from the uidot family substituted.

We need to ensure that the macro is defined with `\nfss@catcodes` in force (not quite sure why at the moment to be honest).

```

534  ⟨/2ekernel⟩
535  ⟨*2ekernel | \latexrelease⟩
536  ⟨\latexrelease⟩\IncludeInRelease{2020/02/02}%
537  ⟨\latexrelease⟩      {\DeclareFontFamilySubstitution}{Provide family substitution}%
538  \begingroup
539  \nfss@catcodes
540  \gdef\DeclareFontFamilySubstitution#1#2#3{%

```

We only provide a set of silent substitutions. The package also (re)declared the family, but this is incorrect in my eyes and it is better to handle that differently.

Of course the families may still need loading at this point and so we arrange for this. Otherwise we might run into trouble because the necessary \DeclareFontFamily has not been seen.

```

541  \LoadFontDefinitionFile{#1}{#2}%
542  \LoadFontDefinitionFile{#1}{#3}%
543  \DeclareFontShape{#1}{#2}{m}{it}{<->ssub * #3/m/it}{}%
544  \DeclareFontShape{#1}{#2}{m}{n}{<->ssub * #3/m/n}{}%
545  \DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{}%
546  \DeclareFontShape{#1}{#2}{m}{sl}{<->ssub * #3/m/sl}{}%

```

These days a few more shapes might be around, so we declare those too. If they don't exist then after the first substitution normal fallbacks will happen.

```

547  \DeclareFontShape{#1}{#2}{m}{sw}{<->ssub * #3/m/sw}{}%
548  \DeclareFontShape{#1}{#2}{m}{scit}{<->ssub * #3/m/scit}{}%
549  \DeclareFontShape{#1}{#2}{m}{scsl}{<->ssub * #3/m/scsl}{}%

```

Same game with b and bx, for other weights you are on your own:

```

550  \DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/b/it}{}%
551  \DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/b/n}{}%
552  \DeclareFontShape{#1}{#2}{b}{scit}{<->ssub * #3/b/scit}{}%
553  \DeclareFontShape{#1}{#2}{b}{scsl}{<->ssub * #3/b/scsl}{}%
554  \DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/b/sc}{}%
555  \DeclareFontShape{#1}{#2}{b}{sl}{<->ssub * #3/b/sl}{}%
556  \DeclareFontShape{#1}{#2}{b}{sw}{<->ssub * #3/b/sw}{}%
557  \DeclareFontShape{#1}{#2}{bx}{it}{<->ssub * #3/bx/it}{}%

```

```

558 \DeclareFontShape{#1}{#2}{bx}{n}{<->ssub * #3/bx/n}{}%
559 \DeclareFontShape{#1}{#2}{bx}{scit}{<->ssub * #3/bx/scit}{}%
560 \DeclareFontShape{#1}{#2}{bx}{scs1}{<->ssub * #3/bx/scs1}{}%
561 \DeclareFontShape{#1}{#2}{bx}{sc}{<->ssub * #3/bx/sc}{}%
562 \DeclareFontShape{#1}{#2}{bx}{s1}{<->ssub * #3/bx/s1}{}%
563 \DeclareFontShape{#1}{#2}{bx}{sw}{<->ssub * #3/bx/sw}{}%
564 }
565 \endgroup

606 〈latexrelease〉}
607 〈latexrelease〉\EndIncludeInRelease
608 {<2ekernel>
609 \onlypreamble\DeclareErrorFont

```

(End of definition for \DeclareErrorFont.)

\wrong@fontshape Before we come to the macro \extract@font we have to take care of unknown \curr@fontshape combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails TeX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```

610 {</2ekernel>
611 〈latexrelease〉\IncludeInRelease[2015/01/01]{\wrong@fontshape}%
612 〈latexrelease〉                      {Font substitution in preamble}%
613 {<2ekernel | latexrelease>
614 \def\wrong@fontshape{%
615   \csname D@\f@encoding\endcsname % install defaults if in math

```

We remember the wanted \curr@fontshape combination which we will need in a moment.

```

616   \edef\reserved@a{\csname\curr@fontshape\endcsname}%
617   \ifx\last@fontshape\reserved@a
618     \errmessage{Corrupted NFSS tables}%
619     \error@fontshape
620   \else

```

Then we warn the user about the mess and set the shape to its default.

```
621   \let\f@shape\default@shape
```

If the combination is not known, try the default *series*.

```

622   \expandafter\ifx\csname\curr@fontshape\endcsname\relax
623     \let\f@series\default@series

```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```

624   \expandafter
625   \ifx\csname\curr@fontshape\endcsname\relax
626     \let\f@family\default@family

```

If we change the font family and we are in the preamble then the corresponding .fd file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in “NFSS tables corrupted”. After begin document that will not happen as all .fd files involved in substitution are loaded at \begin{document}.

```

627   \begingroup
628     \try@load@fontshape
629   \endgroup
630   \fi \fi
631 \fi

```

At this point a valid `\curr@fontshape` combination must have been found. We inform the user about this fact.

The `\expandafter\string` here stops TeX adding the space that it usually puts after command names in messages. The similar construction with `\@undefined` just produces ‘undefined’, but saves a few tokens.

`\@wrong@font@char` is locally redefined in `\UseTextSymbol` from its normal (empty) definition, to report the symbol generating the font switch.

```
632     \@font@warning{Font shape `\\expandafter\\string\\reserved@a'
633             \\expandafter\\gobble\\string\\@undefined\\MessageBreak
634             using `\\curr@fontshape' instead\\@wrong@font@char}%
635     \\global\\let\\last@fontshape\\reserved@a
```

We change `\@defaultsubs` to produce a warning at the end of the document. The macro `\@defaultsubs` is initially `\relax` but gets changed here if some default font substitution happens. It is then executed in `\enddocument`.

```
636     \\gdef\\@defaultsubs{%
637         \@font@warning{Some font shapes were not available, defaults
638             substituted.\\@gobbletwo}}%
```

If we substitute a `\curr@fontshape` combination by the default one we don’t want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally `\let` the macro corresponding to the wanted combination equal to its substitution. This requires the use of four `\expandafter`’s since `\csname...\\endcsname` has to be expanded before `\reserved@a` (i.e. the requested combination), and this must happen before the `\let` is executed.

```
639     \\global\\expandafter\\expandafter\\expandafter\\let
640         \\expandafter\\reserved@a
641         \\csname\\curr@fontshape\\endcsname
```

Now we can redefine `\font@name` accordingly. This *must* be done globally since it might occur in the group opened by `\define@newfont`. If we would this definition were local the closing `\endgroup` there would restore the old meaning of `\font@name` and then switch to the wrong font at the end of `\selectfont` although the correct font was loaded.

```
642     \\xdef\\font@name{%
643         \\csname\\curr@fontshape\\f@size\\endcsname}%
```

The last thing this macro does is to call `\pickup@font` again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```
644     \\pickup@font}
645     (\\2ekernel | latexrelease)
646     \\\\endIncludeInRelease
647     \\\\EndIncludeInRelease{0000/00/00}{\\@wrong@fontshape}%
648     \\\\EndIncludeInRelease {Font substitution in preamble}%

679 〈\latexrelease〉\EndIncludeInRelease
680 〈*2ekernel〉

```

(End of definition for `\wrong@fontshape`.)

`\@wrong@font@char` Normally empty but redefined in `\UseTextSymbol` so that the Font shape undefined message can refer to the symbol causing the problem.

```
681 \let\@wrong@font@char\@empty
```

(End of definition for `\@wrong@font@char`.)

`\@@defaultsubs` See above.

```
682 \let\@defaultsubs\relax
```

(End of definition for `\@@defaultsubs` and `\@defaultsubs`.)

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the TeXbook, p. 382).

```
683 \def\strip@prefix#1>{}
```

(End of definition for `\strip@prefix`.)

4 Assigning math fonts to *versions*

`\install@mathalphabet` This is just another name for `\gdef` but we can redefine it if necessary later on.

```
684 \let\install@mathalphabet\gdef
```

(End of definition for `\install@mathalphabet`.)

`\math@fonts`

```
685 \let\math@fonts\@empty
```

(End of definition for `\math@fonts`.)

\select@group \select@group has four arguments: the new *math alphabet identifier* (a control sequence), the *math group number*, the extra macro for math mode and the \curr@fontshape definition macro name. We first check if we are in math mode.

```
686 %\def\select@group#1#2#3{\relax\ifmmode
```

We do these things locally using \begingroup instead of \bgroup to avoid the appearance of an empty Ord atom on the math list.

```
687 % \begingroup
```

We set the math fonts for the *family* in question by calling \getanddefine@fonts in the correct environment.

```
688 % \escapechar\m@ne
```

```
689 % \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%
```

We globally select the math fonts...

```
690 % \globaldefs\one \math@fonts
```

... and close the group to restore \globaldefs and \escapechar.

```
691 % \endgroup
```

As long as no *size* or *version* change occurs the *math alphabet identifier* should simply switch to the installed *math group* instead of calling \select@group unnecessarily. So we globally redefine the first argument (the new *math alphabet identifier*) to expand into a \mathgroup switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro. The original code for the end of \select@group was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the *math alphabet identifier* and then calling the new definition to switch to the wanted *math group*. Now we define the *math alphabet identifier* as a call to the \use@mathgroup command.

```
692 % \xdef#1{\noexpand\use@mathgroup\noexpand#2%
```

```
693 % {\number\csname c@mv@\math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro \mv@(*version*) so that it calls \getanddefine@fonts directly in future as well. We use the macro \extract@alph@from@version to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```
694 % \expandafter\extract@alph@from@version
```

```
695 % \csname mv@\math@version\expandafter\endcsname
```

```
696 % \expandafter{\number\csname c@mv@\math@version\endcsname}#1%
```

```
697 %
```

```
698 % \stepcounter{mv@\math@version}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```
699 %\expandafter #1\fi}
```

(End of definition for `\select@group`.)

`\extract@alph@from@version`

We proceed to the definition of the macro `\extract@alph@from@version`. As stated above, it takes a math alphabet identifier and a math version macro (e.g. `\mv@normal`) as its arguments.

```
700 \def\extract@alph@from@version#1#2#3{%
```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

```
\install@mathalphabet<math alphabet identifier> #3{%
  <Definitions for #3>}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

```
701 \def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%
```

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (#1), the following tokens in its third argument (#3), and the replacement text for the math alphabet identifier #3 in its second argument. (#2). This is then recorded for later use in a temporary macro `\reserved@b`.

```
702 \def\reserved@b{##2}{%
```

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (#1 and #3) and the yet to build new definitions for the math alphabet identifier #3.

```
703 \def\reserved@c####1{\gdef#1{##1####1##3}}}%
```

Then we execute our auxiliary macro.

```
704 \expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group<math alphabet identifier>
  <math group number><math extra part>
<curr@fontshape definition>
```

So we define a new temporary macro `\reserved@a` that extracts these parts.

```
705 \def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

```
706 \reserved@c{%
707   \getanddefine@fonts{#2}##2%
708   \install@mathalphabet#3{%
709     \relax\ifmmode \else \non@alpherr#3\fi
710     \use@mathgroup##1{#2}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
711 \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi  
712 \use@mathgroup##1{#2}}}%
```

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

```
713 \expandafter\reserved@a\reserved@b\@nil  
714 }
```

(*End of definition for `\extract@alph@from@version`.*)

`\math@bgroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use `\bgroup` instead of `\begingroup` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```
715 \let\math@bgroup\bgroup  
716 \def\math@egroup#1{#1\egroup}
```

(*End of definition for `\math@bgroup` and `\math@egroup`.*)

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in `mthscale.sty`.

```
717 \gdef\calculate@math@sizes{  
718   \@font@info{Calculating space math\space sizes\space for\space  
719   size\space <\f@size>}%  
720   \dimen@\f@size \p@  
721   \tempdimb \defaultscriptratio \dimen@  
722   \dimen@ \defaultscriptscriptratio \dimen@  
723   \expandafter\xdef\csname S@\f@size\endcsname{  
724     \gdef\noexpand\tf@size{\f@size}%  
725     \gdef\noexpand\sf@size{\strip@pt\tempdimb}%  
726     \gdef\noexpand\ssf@size{\strip@pt\dimen@}%  
727     \noexpand\math@fonttrue}}
```

(*End of definition for `\calculate@math@sizes`.*)

`\defaultscriptratio` The default ratio for math sizes is:

`\defaultscriptscriptratio` 1 to `\defaultscriptratio` to `\defaultscriptscriptratio`.

By default this is 1 to .7 to .5.

```
728 \def\defaultscriptratio{.7}  
729 \def\defaultscriptscriptratio{.5}
```

(*End of definition for `\defaultscriptratio` and `\defaultscriptscriptratio`.*)

`\noaccents@` If we don’t have a definition for `\noaccents@` we provide a dummy.

```
730 \ifx\noaccents@\undefined  
731   \let\noaccents@\empty  
732 \fi
```

(*End of definition for `\noaccents@`.*)

\showhyphens The \showhyphens command must be redefined since the version in plain.tex uses \tenrm. We have also made some further adjustments for its use in L^AT_EX.

```

733 〈/2ekernel〉
734 〈latexrelease〉\IncludeInRelease{2017/01/01}{\showhyphens}%
735 〈latexrelease〉                                {XeTeX support for \showhyphens}%
736 〈*2ekernel | latexrelease〉
737 \ifx\XeTeXcharclass\@undefined

```

Version for engines other than XeT_EX.

745     \color@endgroup}%
746 \else

```

XeT_EX version. When using system fonts XeT_EX reports consecutive runs of characters as a single item in box logging, which means the standard \showhyphens does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the lmr OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It would generate spurious Missing Character warnings in the log, these are however suppressed from the terminal and log output by ensuring that \tracinglostchars is locally zero.

```

File 25

ltfssaxes.dtx

This file contains the implementation for handling extra axes by splitting the series and the shape values into sub-categories. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX Font Selection Scheme.

```
1 〈2ekernel〉\message{NFSS axes,}
```

Everything in this file got introduced 2020/02/02, so we use large rollback chunks, only interrupted if necessary.

```
2 〈*2ekernel | latexrelease〉
```

```
3 〈latexrelease〉\IncludeInRelease{2025/06/01}%
```

```
4 〈latexrelease〉 {\DeclareFontSeriesChangeRule}{Series change rules}%
```

1 Changing the font series

In the original NFSS implementation the series was a single attribute stored in `\f@series` and so one always had to specify both weight and width together. This meant that it was impossible to typeset a paragraph in a condensed font and inside have a few words in bold weight (but still condensed) without doing this manually by requesting `\fontseries{bc}\selectfont`.

The new implementation now works differently, by looking at both the current value of `\f@series` and the requested new series; these are then used to select a new series value. Thus, if the current series is `c` and we ask for `b` we now get `bc`.

This is done by consulting a simple lookup table. This table is configurable (though most likely that flexibility will seldom if ever be needed). Adding or changing entries in this table is done with `\DeclareFontSeriesChangeRule`.

1.1 The series lookup table

`\DeclareFontSeriesChangeRule` The macro `\DeclareFontSeriesChangeRule` defines entries in a simple database (implemented as a set of commands) that define mappings from the current series and a requested new series to a result series (and additionally offers an alternative if the desired one is unavailable):

```
#1 current \f@series
```

```
#2 requested new series
```

```
#3 result (provided this series exists in the given font family)
```

```
#4 alternative result (if #3 does not exist)
```

If an `.fd` file has its own substitution rules then #3 exist and thus #4 is not applied.

If there is no matching database entry, or if neither the result nor the alternative result exists in this font family, then the requested new series is used (which then may trigger substitutions later on).

```
5 〈\def\DeclareFontSeriesChangeRule#1#2#3#4{%
6      \c@namedef{series@#1@#2}{{#3}{#4}}}
```

(End of definition for `\DeclareFontSeriesChangeRule`.)

1.2 Mapping rules for series changes

The rules set up use explicit series values not `\..default` indirections; my current feeling is that this is in fact better.

With 9 weight values (from `ul` to `ub`) and 9 width values (from `uc` to `ux`), this table is now rather large (far more than 1000 entries), but, on the other hand, the table doesn't change and accessing rules is fast when using a table implemented in this way.

We could alternatively split the axis and maintain weight and width separately, but that would take more processing time and would not allow for setting up explicit exceptions nicely (not sure that this would ever get used though).

Design considerations for mapping entries:

- We make `m` reset both weight and width (as this is how it always worked). To reset just the width `?m` is provided and to reset just the weight `m?` is provided.
- We support “`m<width>`” and “`<weight>m`”, e.g., `mec` to mean “go to medium weight and extra-condensed width”. At the end of the process we automatically drop any leftover `m` in the series name (unless it is just a single `m`).
- If there is no table entry then the requested series is used unconditionally. This means that we usually do not need entries where the second argument (the requested series) and the third argument (the result series) are identical (unless we want to use the fourth argument to specify an alternative result series). In particular, this means:
 - Any request for `m` needs no entry, i.e., there are no entries which have `m` as the second argument.
 - Any request to set both weight and width (e.g., `sbx` or `ulc`) needs no entry. For that reason, there are no entries which have a weight+width as second argument (except for cases involving `bx`, see below). In particular, this is also true for cases involving `m`, e.g., `bm` (bold medium width) which automatically gets reduced to `b`, or `mc` (medium weight condensed) which becomes `c` as a result.

There is one exception: we do have rules for a request for `bx`; this is because the Computer Modern fonts (or related families like Latin Modern) need `bx` as their bold series default (`\bfdefault`), since they only have a `b` series for a restricted set of font faces. Many other font families have only `b` but no `bx`, so we have explicit rules that fall back from `bx` to `b`.

- For each combination of a non-`m` `<weight>` and a non-`m` `<width>`, there are 19 entries which have “`<weight><width>`” as first argument: 8 of them have the weight values from `ul` to `ub` except `m` as second argument, another 8 have the width values from `uc` to `ux` except `m` as second argument, and (further down in this file) there is one entry which has `bx` as second argument and two further entries which have `m?` and `?m` as second argument. Rules which have `m` or a weight+width (other than `bx`) as second argument aren't needed (see above).
- For each non-`m` `<weight>`, there are at least 11 entries which have “`<weight>`” as first argument: 8 of them have the width values from `uc` to `ux` except `m` as second argument, and (further down in this file) there is one entry which has `bx` as second argument and two further entries which have `m?` and `?m` as second argument. Rules which have a single weight value as second argument aren't needed because the

second and third arguments would then be identical. In some cases, there are extra rules which make use of the fourth argument to specify an alternative result series.

- Similarly, for each non-**m** $\langle width \rangle$, there are at least 11 entries which have “ $\langle width \rangle$ ” as first argument: 8 of them have the weight values from **ul** to **ub** except **m** as second argument, and (further down in this file) there is one entry which has **bx** as second argument and two further entries which have **m?** and **?m** as second argument. Rules which have a single width value as second argument aren’t needed because the second and third arguments would then be identical. In some cases, there are extra rules which make use of the fourth argument to specify an alternative result series.
- Only a few entries have “alternative” values.

The idea is that you don’t want the normal substitution to kick in because that would reset the shape first and it may be better to stay with **b** when a change to **c** is requested and **bc** doesn’t exist, than to go to first change the shape to **n** and then find that **bc/n** doesn’t exist either and thus ending up with **m/n**.

We mainly do this when **sb**, **eb**, or **ub** is requested but can’t be fulfilled. In that case it is better to try to stay with some sort of bold rather than ending up with **m**. There are some other cases where an “alternative” value is specified; these are explained below in the appropriate places.

```

There are a number of font families that implement condensed series, but often only `c` and `bc`. Therefore, if we see a weight or width change request that can't be fulfilled we try to stay with `c` or `bc`.

```

579 \DeclareFontSeriesChangeRule {c}{ul}    {ulc} {c}
580 \DeclareFontSeriesChangeRule {c}{el}    {elc} {c}
581 \DeclareFontSeriesChangeRule {c}{l}     {lc} {c}
582 \DeclareFontSeriesChangeRule {c}{sl}    {slc} {c}
583 \DeclareFontSeriesChangeRule {c}{sb}    {sbc} {bc}
584 \DeclareFontSeriesChangeRule {c}{b}     {bc} {}
585 \DeclareFontSeriesChangeRule {c}{eb}    {ebc} {bc}
586 \DeclareFontSeriesChangeRule {c}{ub}    {ubc} {bc}
587 \DeclareFontSeriesChangeRule {c}{uc}    {uc} {c}
588 \DeclareFontSeriesChangeRule {c}{ec}    {ec} {c}
589 \DeclareFontSeriesChangeRule {c}{sc}    {sc} {c}

590 \DeclareFontSeriesChangeRule {sc}{ul}   {ulsc} {}
591 \DeclareFontSeriesChangeRule {sc}{el}   {elsc} {}
592 \DeclareFontSeriesChangeRule {sc}{l}    {lsc} {}
593 \DeclareFontSeriesChangeRule {sc}{sl}   {slsc} {}
594 \DeclareFontSeriesChangeRule {sc}{sb}   {sbsc} {bsc}
595 \DeclareFontSeriesChangeRule {sc}{b}    {bsc} {}
596 \DeclareFontSeriesChangeRule {sc}{eb}   {ebsc} {bsc}
597 \DeclareFontSeriesChangeRule {sc}{ub}   {ubsc} {bsc}

598 \DeclareFontSeriesChangeRule {m}{sb}    {sb} {b}
599 \DeclareFontSeriesChangeRule {m}{eb}    {eb} {b}
600 \DeclareFontSeriesChangeRule {m}{ub}    {ub} {b}

```

This special rule normally does nothing since nearly every font implements the `b` bold series. The exception are Computer Modern and Latin Modern and fonts based on them. They usually only have `bx`, but then they normally provide an `.fd` file declaration mapping from `b` to `bx` and thus pretend that `b` exists. But in case any of them does not, we offer an alternative result and switch to `bx` if `b` can't be found.

```

917 \DeclareFontSeriesChangeRule {ebuc}{eb} {ebuc} {}

```

In the following rule, we use `eb` instead of `b` in the fourth argument, since `eb` is a better approximation to `ub` than `b` and `ebuc` is already in the first argument and we can therefore assume that this font face actually exists. A similar consideration also applies to some other rules in the following.

```

918 \DeclareFontSeriesChangeRule {ebuc}{ub} {ubuc} {ebuc}
919 \DeclareFontSeriesChangeRule {ebuc}{uc} {ebuc} {}

```

```

920 \DeclareFontSeriesChangeRule {ebuc}{ec} {ebec} {}

```

Special rules for `1m` etc. aren't needed because if `1m` is requested, it will be used if there is no rule, and that is then reduced to `1` automatically. Same for `mc` and friends.

The following entries handle a request for `bx` and fall back to `b` if that can't be fulfilled.

```

1187 \DeclareFontSeriesChangeRule {uluc}{bx} {bx} {b}
1188 \DeclareFontSeriesChangeRule {ulec}{bx} {bx} {b}
1189 \DeclareFontSeriesChangeRule {ulc}{bx} {bx} {b}
1190 \DeclareFontSeriesChangeRule {ulsc}{bx} {bx} {b}
1191 \DeclareFontSeriesChangeRule {ul}{bx} {bx} {b}
1192 \DeclareFontSeriesChangeRule {ulsx}{bx} {bx} {b}
1193 \DeclareFontSeriesChangeRule {ulx}{bx} {bx} {b}
1194 \DeclareFontSeriesChangeRule {ulex}{bx} {bx} {b}
1195 \DeclareFontSeriesChangeRule {ulux}{bx} {bx} {b}

1196 \DeclareFontSeriesChangeRule {eluc}{bx} {bx} {b}
1197 \DeclareFontSeriesChangeRule {elec}{bx} {bx} {b}

1430 </2ekernel | latexrelease>
1431 <| latexrelease>\EndIncludeInRelease

```

Supporting rollback ...

```

1432 <| latexrelease>\IncludeInRelease{2020/02/02}%
1433 <| latexrelease> {\| DeclareFontSeriesChangeRule\}{Series change rules}%

```

The next definition is only needed if somebody rolls forward from a release older than 2020-02-02 but not to the latest version but one before 2025-06-01. Pretty unlikely, but

```

.....
1434 <| latexrelease>
1435 <| latexrelease>\def\DeclareFontSeriesChangeRule#1#2#3#4{%
1436 <| latexrelease> \@namedef{series@#1@#2}{\{\#3\}\{\#4\}}}
1437 <| latexrelease>

```

The huge set of declarations below are those from 2020-02-02 plus all from above that were newly added (but now with empty result and alternative result arguments). To compile this list I sorted both together and then dropped entries appearing twice. This is why the sorting is now different from the one above.

1.3 Changing to a new series

```

2779 〈*2ekernel | \latexrelease〉
2780 〈\latexrelease〉\IncludeInRelease{2021/06/01}%

```

```

2781 〈latexrelease〉          {\fontseries}{delay fontseries update}%
\fontseries The \fontseries command takes one argument which is the requested new font series. In
the original implementation it simply saved the expanded value in \f@series. Now we do
a bit more processing and look up the final value in the font series data base. This is done
by \merge@font@series. But the lookup should be done within the target family and
call to \fontseries might be followed by a \fontfamily call. So we delay the processing
to \selectfont and only record the necessary action in \delayed@f@adjustment.

2782 \DeclareRobustCommand\fontseries[1]{\@forced@seriesfalse
2783   \expandafter\def\expandafter\delayed@f@adjustment\expandafter
2784     {\delayed@f@adjustment\delayed@merge@font@series{\#1}}}

(End of definition for \fontseries.)
```

\delayed@f@adjustment The macro holding the delayed action(s) for use in \selectfont.

```

2785 \let\delayed@f@adjustment\empty

(End of definition for \delayed@f@adjustment.)
```

\fontseriesforce To change unconditionally to a new series you can use \fontseriesforce. Of course, if
the series doesn't exist for the current family substitution still happens, but there is not
dependency on the current series.

```

2786 \DeclareRobustCommand\fontseriesforce[1]{\@forced@seriestrue
2787   \expandafter\def\expandafter\delayed@f@adjustment\expandafter
2788     {\delayed@f@adjustment\edef\f@series{\#1}}}

(End of definition for \fontseriesforce.)
```

\if@forced@series If the series gets forced we need to know that fact later on.

```

2789 \newif\if@forced@series

(End of definition for \if@forced@series.)
```

2802 〈latexrelease〉
2803 〈latexrelease〉\EndIncludeInRelease
```

```

2804  ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
2805  ⟨latexrelease⟩                               {\fontseries}{delay fontseries update}%
2806  ⟨latexrelease⟩
2807  ⟨latexrelease⟩\DeclareRobustCommand\fontseries[1]{\edef\f@series{\#1}}
2808  ⟨latexrelease⟩\let\fontseriesforce\@undefined
2809  ⟨latexrelease⟩
2810  ⟨latexrelease⟩\EndIncludeInRelease
2811  ⟨*2ekernel | latexrelease⟩
2812  ⟨latexrelease⟩\IncludeInRelease{2020/02/02}%
2813  ⟨latexrelease⟩  {\merge@font@series}{Merge series values}%

```

`\merge@font@series` We look up the data base value by expanding the right command twice. If no such value exist then the result will be `\relax` otherwise it will be the two brace groups: the desired result and the alternate result. The first case means that the third argument to `\merge@font@series` will be empty.

```

2814 \def\merge@font@series#1{%
2815   \expandafter\expandafter\expandafter
2816   \merge@font@series@
2817   \csname series@\f@series \#1\endcsname
2818   {\#1}%
2819   \nil
2820 }

```

(End of definition for `\merge@font@series`.)

`\merge@font@series@` This now defines the new `\f@series`:

```
2821 \def\merge@font@series@#1#2#3\@nil{%
```

If the third argument is empty there is no database entry for the combination and the second argument holds the new series so we return that.

Originally the test was simply `\ifx!#3!` but that actually dies if #3 starts with a conditional and in the definition of `\AmSfont` that is actually the case.

```

2822 \%ifcat\expandafter X\detokenize{\#1}X%
2823 \def\reserved@a{\#3}%
2824 \ifx\reserved@a\empty
2825   \set@target@series{\#2}%
2826 \else

```

Otherwise we check if the desired result for the series (#1) exists for the font family and the current shape. All this happens inside `\selectfont` which has already taken care to load the `.fd` file if necessary.

```

2827 \edef\reserved@a{\f@encoding /\f@family /\#1/\f@shape}%
2828 \ifcsname \reserved@a \endcsname

```

If the desired result is available then we use that. However, we do need some post-processing because we need to drop surplus `ms` due to the way naming convention was designed in the '90s (sigh).

```
2829 \set@target@series{\#1}%

```

If not, then we try the alternate result (#2).

```

2830 \else
2831   \ifcsname \f@encoding /\f@family /\#2/\f@shape \endcsname

```

If the alternate result exist we use that and also issue a warning (or rather a log entry) that we didn't managed to change to the desired font.

```
2832     \set@target@series{#2}%
2833     \@font@shape@subst@warning
```

If that doesn't exist either, then we use the requested series unmodified (again with a warning).

```
2834     \else
2835         \set@target@series{#3}%
2836         \@font@shape@subst@warning
2837     \fi
2838     \fi
2839 \fi
2840 }
```

It is possible that the previous font and the new one are actually identical (and the font was not found because it still needs loading) in which case a warning would look rather odd. So we make a quick check for that (which is the reason why we defined `\@reserved@a` above instead of doing inline testing inside `\ifcsname`).

```
2841 \def\@font@shape@subst@warning{%
2842     \edef\reserved@b{\curr@fontshape}%
2843     \ifx\reserved@a\reserved@b \else
2844         \@font@warning{Font shape `'\reserved@a' undefined\MessageBreak
2845                         using `'\reserved@b' instead}%
2846     \fi
2847 }
```

(End of definition for `\merge@font@series@`.)

`\merge@font@series@without@substitution` `\merge@font@series@without@substitution@` `\delayed@merge@font@series` `\merge@font@series@without@substitution` works like `\merge@font@series`, i.e., it looks up the combination in the rule base and if there exists an entry it uses it and if not it uses the new series value. However, it doesn't check if there is actually a font face with the new series value as `\merge@font@series` does. This simplified command is used in `\selectfont` at a point where other font attributes are not yet updated so that checking the font face might result incorrect in substitutions.

```
2848 \def\merge@font@series@without@substitution#1{%
2849     \expandafter\expandafter\expandafter
2850     \merge@font@series@without@substitution@
2851     \csname series@\f@series \#1\endcsname
2852     \{#1}\%
2853     \@nil
2854 }
2855 \def\merge@font@series@without@substitution@#1#2#3\@nil{%
2856     \def\reserved@a{#3}%
2857     \ifx\reserved@a\empty
2858         \set@target@series{#2}%
2859     \else
2860         \set@target@series{#1}%
2861     \fi
2862 }
```

*(End of definition for `\merge@font@series@without@substitution`,
`\merge@font@series@without@substitution@`, and `\delayed@merge@font@series`.)*

\delayed@merge@font@series When we delay the merge action in \fontseries we first attempt to use merging without substitution. If that results in a non-existing font face the merge is redone in \selectfont using a version with substitution. See \selectfont for details.

```
2863 \let\delayed@merge@font@series\merge@font@series@without@substitution
```

(End of definition for \delayed@merge@font@series.)

\maybe@load@fontshape A small helper that we use a couple of times: try loading a fontshape (in a group because \try@load@fontshape normalizes catcodes and we also want to change \typeout so that it doesn't report missing .fd files on the terminal).

```
2864 \def\maybe@load@fontshape{%
2865   \begingroup
2866   \let \typeout \font@info
2867   \try@load@fontshape
2868 }
```

(End of definition for \maybe@load@fontshape.)

\set@target@series Finally the code for normalizing the \f@series value.

The combined series value determined by the mapping may still contain an m that we have to remove (as the .fd files use c not mc to denote a medium weight condensed series, etc.). We do this in all branches above because a user might have written

```
\DeclareFontSeriesChangeRule {m}{sc}{msc}{mc}
```

instead of using sc and c as needed in the .fd file.

```
2869 \def\set@target@series#1{%
```

We need to \edef the argument first in case it starts with a conditional. Then we check (and perhaps drop) an "m" from the value and assign the result to \f@series.

```
2870 \edef\f@series{\#1}%
2871 \series@maybe@drop@one@m\f@series\f@series
2872 }
```

(End of definition for \set@target@series.)

\series@maybe@drop@one@m If the series value is in NFSS notation then it should not contain any "m" unless it is just an "m" by its own. So we need to drop surplus "m"s. But we better don't do this for full names, such as "semibold" as used by autoinst, for example. So we test against the possible explicit values that should drop an "m". After that we assign the result to #2 for further use.

```
2873 \def\series@maybe@drop@one@m#1{%
2874   \expandafter\series@maybe@drop@one@m@x\expandafter{\#1}}
2875
2876 \def\series@maybe@drop@one@m@x#1#2{%
```

The code below is an inline version of the \in@ macro without the group, so that it works in \accent.

```
2877 \def\in@@##1,#1,{}%
2878 \series@check@toks\expandafter{\in@@
2879   ,ulm,elm,lm,slm,mm,sbm,bm,ebm,ubm,muc,mec,mc,msc,msx,mx,mex,mux,{}{},#1,}%
2880 \edef\in@{\the\series@check@toks}%
2881 \ifx\in@{\empty}
```

The default definition for `\bfdefault` etc is actually `\empty` so that we can detect if the user has changed the default. However that means a) the above test will definitely fail (maybe something to change) and b) we better use `\edef` on the next line to get rid of it as otherwise the test against #2 (e.g., `\bfdef@ult`) will fail in other places.

```

2882   \edef#2{\#1}%
2883   \else
2884     \edef#2{\expandafter\series@drop@one@m #1\series@drop@one@m}%
2885   \fi
2886 }
```

As a precaution we use a private toks register not `\toks@` as that is no longer hidden inside the group.

```
2887 \newtoks\series@check@toks
```

(End of definition for `\series@maybe@drop@one@m`.)

`\series@drop@one@m` Drop up to two `m`s but keep one if that makes the series value empty. Actually, with the current implementation we know that there is at least one in the series value itself and we added one after it, so all we have to do is now returning #1#2 and dropping the rest.

```

2888 \def\series@drop@one@m#1#2m#3\series@drop@one@m{%
2889 % \ifx\relax#1#2\relax m\else#1#2\fi
2890 #1#2%
2891 }
```

(End of definition for `\series@drop@one@m`.)

Supporting rollback ...

2 Changing the shape

Shapes are also split in two axes (though it could be more if that is desirable), essentially building in an “sc” axis.

```

2909 {*2ekernel | latexrelease}
2910 <latexrelease>\IncludeInRelease{2020/02/02}%
2911 <latexrelease> {\ulcshape}{Font shape change rules}%
```

\DeclareFontShapeChangeRule The database for shapes is done in exactly the same way, only that it is much smaller and we usually have no alternative shape (or rather it is empty thus not used).

```
2912 \def\DeclareFontShapeChangeRule #1#2#3#4{%
2913   \c@namedef{shape@#1@#2}{\{\#3\}\{\#4\}}}
```

(End of definition for \DeclareFontShapeChangeRule.)

There is kind of the same problem with returning back from **sc** to normal. It sort of needs its own letter. In **fontspec** this was solved by the first time **\upshape** changes **it** or **sl** back (so only **sc** remains) and second time it changes then **sc** back to normal. Maybe that's not a bad way to handle it, but decided for a slightly different approach: **n** always returns to "normal", ie resets everything and **up** changes italic or slanted to upright and **ulc** undoes small caps.

So we now offer **\normalshape** (using **\shapedefault**) which is normally the same as calling both **\ulcshape** and **\upshape**, only more efficient.

\ulcshape To request going back to upper/lowercase we need a new command. It uses **ulc** as shape name but this shape is virtual, i.e., it doesn't exist as a real shape, it is only used as part of the database table entries and thus only appears in the second argument there (but not in the first).

```
2914 \DeclareRobustCommand\ulcshape
2915   {\not@math@alphabet\ulcshape\relax
2916   \fontshape\ulcdefault\selectfont}
2917 \let\ulcdefault\@undefined % for rollback
2918 \newcommand\ulcdefault{ulc}
```

(End of definition for \ulcshape, \textulc, and \ulcdefault.)

\swshape New command to select a swash shape. The standard rules put this in the same category as italics or slanted, i.e., if you ask for it then italics are undone. One could provide more complicated rules so that **it** + **sw** becomes **swit** but given that there are only very few fonts that have swash letters that level of flexibility (these days) would be just resulting in a lot of combinations that do not exist.

```
2919 \DeclareRobustCommand\swshape
2920   {\not@math@alphabet\swshape\relax
2921   \fontshape\swdefault\selectfont}
2922 \let\swdefault\@undefined % for rollback
2923 \newcommand\swdefault{sw}
```

(End of definition for \swshape, \textsw, and \swdefault.)

\sscshape New commands to select spaced small capitals. There isn't a single free font that supports it. However, some commercial ones do, so we offer it. It is also possible to produce spaced small capitals from normal small capitals in OTF fonts using **otftotfm** with calls such as

```
otftotfm -e TEXMF/fonts/enc/dvips/base/texnansx.enc \
SourceSerifPro-Regular.otf -fkern -fliga --feature=smcp \
--letterspacing=80 SourceSerifPro-Regular-ssc-LY1
```

Michael Ummels kindly prepared the necessary rules for **ssc** ages ago, but until recently they managed to hide deep down in my inbox. I finally got around to integrating them (with a few changes) and I also took the opportunity to rationalize (a bit) the rules for the only other uncommon shape, **sw**.

```

2924 \DeclareRobustCommand\sscshape
2925     {\not@math@alphabet\sscshape\relax
2926         \fontshape\sscdefault\selectfont}
2927 \let\sscdefault\@undefined      % for rollback
2928 \newcommand\sscdefault{ssc}

(End of definition for \sscshape, \textssc, and \sscdefault.)

```

2.1 Mapping rules for shape combinations

Many of the entries are commented out as we will get that result without any entry.

```

2944 </2ekernel>
2945 <*2ekernel | latexrelease>
2946 <latexrelease>\IncludeInRelease{2025/06/01}%
2947 <latexrelease>  {\DeclareFontShapeChangeRule}{Rules for ssc and sw}%
2948 %
2949 % \DeclareFontShapeChangeRule {n}{n}  {n}  {}
2950 \DeclareFontShapeChangeRule {n}{it}  {it}  {sl}
2951 \DeclareFontShapeChangeRule {n}{sl}  {sl}  {it}

```

If **sw** is requested but not available (not many font families offer it) we try to fallback to **it** instead of **sw**. That isn't always perfect, because some swash shapes are actually upright, but it is only a fallback and most of the time it would be better than **n**.

```

2952 \DeclareFontShapeChangeRule {n}{sw}  {sw}  {it}
2953 % \DeclareFontShapeChangeRule {n}{sc}  {sc}  {}
2954 \DeclareFontShapeChangeRule {n}{ulc}  {n}  {}
2955 \DeclareFontShapeChangeRule {n}{up}  {n}  {}

```

For the **ssc** shape we make the following general assumptions: if **ssc<X>** exists then **sc<X>** and **<X>** also exist in the font. If the **ssc<X>** shape doesn't exist but the user had asked for **ssc** we try to replace it by **sc** because we then assume that the current font family simply doesn't have any **ssc** shapes. However, if we are already in some **ssc** shape and a shape change is requested we know that at least some **ssc** shapes exist for the current font family, so rather than falling back to some **sc** shape we try to stay within **ssc** shapes in a fallback situation.

```

2956 \DeclareFontShapeChangeRule {n}{ssc}  {ssc}  {sc}

```

```

2957 % \DeclareFontShapeChangeRule {it}{n}  {n}  {}
2958 % \DeclareFontShapeChangeRule {it}{it}  {it}  {}
2959 \DeclareFontShapeChangeRule {it}{sl}  {sl}  {it}
2960 \DeclareFontShapeChangeRule {it}{sw}  {sw}  {it}

```

If neither `scit` nor `scls` exist then `sc` will be used as a fallback albeit with a log entry, so except for the latter there will be no change for CM or Latin Modern fonts.

```

2961 \DeclareFontShapeChangeRule {it}{sc}  {scit}  {scls}
2962 \DeclareFontShapeChangeRule {it}{ulc}  {it}  {}
2963 \DeclareFontShapeChangeRule {it}{up}  {n}  {}
2964 \DeclareFontShapeChangeRule {it}{ssc}  {sscit}  {scit}

2965 % \DeclareFontShapeChangeRule {sl}{n}  {n}  {}
2966 \DeclareFontShapeChangeRule {sl}{it}  {it}  {sl}
2967 % \DeclareFontShapeChangeRule {sl}{sl}  {sl}  {}
2968 \DeclareFontShapeChangeRule {sl}{sw}  {sw}  {it}
2969 \DeclareFontShapeChangeRule {sl}{sc}  {scls}  {scit}
2970 \DeclareFontShapeChangeRule {sl}{ulc}  {sl}  {}
2971 \DeclareFontShapeChangeRule {sl}{up}  {n}  {}
2972 \DeclareFontShapeChangeRule {sl}{ssc}  {sscls}  {scls}

2973 % \DeclareFontShapeChangeRule {sc}{n}  {n}  {}
2974 \DeclareFontShapeChangeRule {sc}{it}  {scit}  {scls}
2975 \DeclareFontShapeChangeRule {sc}{sl}  {scls}  {scit}
2976 \DeclareFontShapeChangeRule {sc}{sw}  {scsw}  {scit}
2977 % \DeclareFontShapeChangeRule {sc}{sc}  {sc}  {}
2978 \DeclareFontShapeChangeRule {sc}{ulc}  {n}  {}

```

The next rule might be a bit surprising, and rightly so. It would be more correct if `sc` were not affected by `up`, so that it remains `sc` as shown in the commented out rule. However, for nearly three decades commands such as `\upshape` or `\textup` changed small caps back to the “normal” shape. So for backward compatibility we keep that behavior.

As a result you are currently typesetting in `scit` or `scls` using `\upshape` twice will return you to the normal shape too, the first will change to `sc` and the second (because of the rule below) change that to `n`. This is the way `fontspec` implemented its version on this interface, so this rule means we are also compatible with the way `fontspec` behaved. Still it remains an oddity which I would rather liked to have avoided.

```

2979 % \DeclareFontShapeChangeRule {sc}{up}  {sc}  {}
2980 \DeclareFontShapeChangeRule {sc}{up}  {n}  {}
2981 % \DeclareFontShapeChangeRule {sc}{ssc}  {ssc}  {}

2982 % \DeclareFontShapeChangeRule {scit}{n}  {n}  {}
2983 \DeclareFontShapeChangeRule {scit}{it}  {scit}  {}
2984 \DeclareFontShapeChangeRule {scit}{sl}  {scls}  {scit}
2985 \DeclareFontShapeChangeRule {scit}{sw}  {scsw}  {scit}
2986 \DeclareFontShapeChangeRule {scit}{sc}  {scit}  {}
2987 \DeclareFontShapeChangeRule {scit}{ulc}  {it}  {}

```

The next rule assumes that if `scit` exists then it exists as well. If not, the mechanism will save `ulc` in `\f@series`, which most certainly doesn’t exist. So when a font is later selected that would result in a substitution (so no harm done really). Alternatively, we could in this case use `n` as alternative, which may be a bit faster, but such a setup would be so weird in the first place that this isn’t worth the effort.

```

2988 \DeclareFontShapeChangeRule {scit}{up}  {sc}  {}
2989 \DeclareFontShapeChangeRule {scit}{ssc}  {sscit}  {scit}

```

```

```

In 2022-02-02 the `ssc` shape had no rules, so that any use of it would have resulted in

just switching to that shape or switching away from it; so we mimic that by providing the corresponding trivial rules to overrule those from above when we roll back.

```

3197   \else
3198     \edef\f@shape{#1}%
3199   \fi
3200 }
3201 \let\delayed@merge@font@shape\merge@font@shape@without@substitution
```

(End of definition for \merge@font@shape@without@substitution,
 \merge@font@shape@without@substitution@, and \delayed@merge@font@shape.)

\normalshape \normalshape resets both sub-axes if the default rules are used.

```
3202 \protected\def\normalshape
3203   {\not@math@alphabet\normalshape\relax
3204   \fontshape\shapedefault\selectfont}%
```

(End of definition for \normalshape.)

3 Make sure we win ...

This code implements one aspect of what the package `fontaxes` provide. So its redefinitions for the various shape commands, such as \itshape should no longer happen. We therefore force the standard definitions at \AtBeginDocument (later when this is defined). Once `fontaxes` is no longer doing such redefinitions that could be taken out again.

We use a separate macro so that we can easily disable this (in case of rollback).

```
\reinstall@nfss@defs I use \protected here not \DeclareRobustCommand to avoid extra status lines.
```

```

File 26

ltfsstrc.dtx

1 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

errorshow Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the **tracefnt** package is *not* loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the **tracefnt** package is loaded.

debugshow In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output).

loading Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the **tracefnt** package became active.

pausing Turn all font warnings into errors so that L^AT_EX will stop.

2 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L^AT_EX this will produce the documentation as well.

```
1 <*driver>
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{ltfsstrc.dtx}
9 \end{document}
10 </driver>
```

3 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11  <*package>
12  %\NeedsTeXFormat{LaTeX2e}
13  %\ProvidesPackage{tracefnt}[??/?/? v?.??
14  %
15  </package>
```

The debug module makes use of commands contained in a special package file named `trace.sty`.³⁴

```
16  <+debug> \input trace.sty
```

4 Handling Options

\tracingfonts Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17  <*2ekernel>
18  \message{NFSS tracing,}
19  \def\tracingfonts{%
20  \@font@warning{Command \noexpand\tracingfonts
21      not provided.\MessageBreak
22      Use the ‘tracefnt’ package.\MessageBreak Command found:}%
23  \count@}
24 </2ekernel>
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
25  <*package,trace,debug>
26  \newcount\tracingfonts
27  \tracingfonts=0
28 </package,trace,debug>
```

(End of definition for `\tracingfonts`.)

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefnt` is not loaded). `infoshow` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
29  <*package>
30  \DeclareOption{errorshow}{%
31  \def\@font@info#1{%
32      \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}{}%
```

³⁴This package is not in distribution at the moment (and probably doesn't work any longer). Think of this part of the code as being historical artifacts.

```

33           {LaTeX Font Info: \space\space\space#1} }%
34   \def\@font@warning#1{%
35       \GenericInfo{(Font)}\@spaces\@spaces\@spaces\space\space}%
36           {LaTeX Font Warning: #1} }%
37   }
38 \DeclareOption{warningshow}{%
39   \def\@font@info#1{%
40       \GenericInfo{(Font)}\@spaces\@spaces\@spaces\space\space}%
41           {LaTeX Font Info: \space\space\space#1} }%
42   \def\@font@warning#1{%
43       \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
44           {LaTeX Font Warning: #1} }%
45   }
46 \DeclareOption{infoshow}{%
47   \def\@font@info#1{%
48       \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
49           {LaTeX Font Info: \space\space\space#1} }%
50   \def\@font@warning#1{%
51       \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
52           {LaTeX Font Warning: #1} }%
53   }
54 \DeclareOption{loading}{%
55   \tracingfonts\tw@
56   }
57 \DeclareOption{debugshow}{%
58   \ExecuteOptions{infoshow}%
59   \tracingfonts\thr@@
60   }
61 \DeclareOption{pausing}{%
62   \def\@font@warning#1{%
63       \GenericError
64           {Font}\@spaces\@spaces\@spaces\space\space}%
65           {LaTeX Font Warning: #1} }%
66           {See the LaTeX Companion for details.} }%
67           {I'll stop for every LaTeX Font Warning because
68           you requested\MessageBreak the 'pausing' option
69           to the tracefnt package.} }%
70   }

```

We make infoshow the default, which in turn defines \font@warning and \font@info.

```

71 \ExecuteOptions{infoshow}
72 \ProcessOptions
73 </package>

```

We also need a default definition inside the kernel:

```

74 <*2ekernel>
75 \def\@font@info#1{%
76     \GenericInfo{Font}\@spaces\@spaces\@spaces\space\space}%
77         {LaTeX Font Info: \space\space\space#1} }%
78 \def\@font@warning#1{%
79     \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
80         {LaTeX Font Warning: #1} }%
81 </2ekernel>

```

5 Macros common to `fam.tex` and `tracefnt.sty`

In the first versions of `tracefnt.dtx` some macros of `fam.dtx`³⁵ were redefined to included the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `ltfss.dtx`.

5.1 General font loading

- `\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the `.tfm`) as it was determined by the NFSS tables.

```
82  {*2ekernel | package}
83  \def\extract@font{%
84    \get@external@font
```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```
85    \global\expandafter\font\font@name\external@font\relax
```

When tracing we typeout the internal and external font name.

```
86  {*trace}
87    \ifnum \tracingfonts >@one
88      @font@info{External font '\external@font',
89                  loaded as\MessageBreak \font@name}\fi
90  
```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```
91  \font@name \relax
```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```
92  \csname \f@encoding+\f@family\endcsname
93  \csname\curr@fontshape\endcsname
94  \relax
95  }
96 
```

The `\relax` at the end needs to be explained. This is inserted to prevent `TeX` from scanning too far when it is executing the replacement text of the loading code macros.

(*End of definition for `\extract@font`.*)

- `\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

```
97  {*2ekernel}
98  \def\get@external@font{%
```

We don’t know the external font name at the beginning.

```
99  \let\external@font\@empty
100 \edef\font@info{\expandafter\expandafter\expandafter\string
101   \csname \curr@fontshape \endcsname}%
102 \try@size@range
```

³⁵This file is currently not distributed in documented form. Its code is part of `ltfss.dtx`.

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It "knows about" `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```

103   \ifx\external@font\empty
104     \try@size@substitution
105     \ifx\external@font\empty
106       @latex@error{Font \expandafter \string\font@name\space
107                     not found}\@eha
108       \error@fontshape
109       \get@external@font
110     \fi\fi
111   }
112 
```

(End of definition for `\get@external@font`.)

```

113 <*2ekernel | latexrelease | package>
114 <| latexrelease> \IncludeInRelease{2021/06/01}%
115 <| latexrelease>           {\selectfont}{Add hook to \selectfont}%

```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```

116 \DeclareRobustCommand\selectfont
117   {%

```

When `debug` is specified we actually want something like 'undebbug'. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```

118 <+debug> \pushtracing
119 <+debug> \ifnum\tracingfonts<4 \tracingoff
120 <+debug> \else \tracingon\p@selectfont \fi

```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```

121   \ifx\f@linespread\baselinestretch \else
122     \set@fontsize\baselinestretch\f@size\f@baselineskip \fi

```

The series and shape updates are only prepared by `\fontseries` and `\fontshape` but not executed until after we are ready to change the font face. This way they happen after a possibly new family is set which is important because they look at the available font faces in that family and alter the selection based on availability. Several calls to `\fontseries` or `\fontshape` are delayed in the order in which they appear, so that by switching them one can work around missing intermediate font faces and avoid substitutions.

We first attempt to do the merge without any substitution. As we might end up with a non-existing font face we may have to restart and therefore save the current values of `\f@series` and `\f@shape` before the merge.

But first we make a quick test to see if there are any delayed actions, because if not it is pointless to make all the assignments and try loading a missing fontshape.

```

123 \ifx\delayed\f@adjustment\empty
124 \else
125   \let\f@shape@saved\f@shape
126   \let\f@series@saved\f@series

```

Then we run the delayed adjustments (which use the `\..@without@substitution` commands):

```
127      \delayed@f@adjustment
```

We then check if the resulting combination is valid but for this we have to make sure that the appropriate `.fd` is loaded if that hasn't happened so far.

```
128      \maybe@load@fontshape
129      \ifcsname \f@encoding/\f@family/\f@series/\f@shape \endcsname
```

If this macro is defined then we are good and no further action is necessary.

Otherwise the combination is not valid, so we redo the merge but this time with substitutions.

```
130      \else
131          \let\f@shape\f@shape@saved
132          \let\f@series\f@series@saved
133          \let\delayed@merge@font@shape\merge@font@shape
134          \let\delayed@merge@font@series\merge@font@series
135          \delayed@f@adjustment
136          \let\delayed@merge@font@shape\merge@font@shape@without@substitution
137          \let\delayed@merge@font@series\merge@font@series@without@substitution
138      \fi
```

Now the series and shape values are updated and we clear `\delayed@f@adjustment`. This is important because on the next execution of `\selectfont` we should not mistakenly redo the delayed actions if there wasn't any series or shape change.

```
139      \let\delayed@f@adjustment\empty
140      \fi
```

If the series was forced we should now cancel that in case the next series change is done with some low-level setting to `\f@series`.

```
141      \forced@seriesfalse
```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L^AT_EX's `\twfbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```
142      \xdef\font@name{%
143          \csname\curr@fontshape/\f@size\endcsname}
```

We call the macro `\pickup@font` which will load the font if necessary.

```
144      \pickup@font
```

Then we select the font.

```
145      \font@name
```

After switching fonts we run a hook, so that packages can make last minute alterations based on the new font (originally provided in `every sel` but using a different interface).

```
146      \UseHook{selectfont}%
```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```
147      \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```
148     \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
149 <+debug> \poptracing
150 }
```

(End of definition for `\selectfont`.)

selectfont Declare the hook used in `selecfont` in the kernel, but not inside the `tracefnt` package.

```
151 <-trace> \NewHook{selectfont}
```

(End of definition for `selectfont`.)

If `\tracingfonts` is greater than 2 we also show the font switch inside `\selectfont`. We do this by adding this code to the hook in the `tracefnt` package: macro might redefine `\font@name`.

```
152 <*trace>
153 \AddToHook{selectfont}
154   {\ifnum \tracingfonts>\tw@
155     \font@info{Switching to \font@name}\fi}
156 
```

`/trace>`

```
157 </2ekernel | latexrelease | package>
158 \latexrelease\EndIncludeInRelease
```

With `\selectfont` having different definitions in different kernels we also have to provide them in the `tracefnt` package to support rollback. In packages that works a bit differently and therefore we have to provide an empty block there.

```
159 <package>\IncludeInRelease{2021/06/01}%
160 <package>           {\selectfont}{Add hook to \selectfont}%
161 <package>\EndIncludeInRelease

162 <\latexrelease | package>\IncludeInRelease{0000/00/00}%
163 <\latexrelease | package>           {\selectfont}{Add hook to \selectfont}%
164 <\latexrelease | package>
165 <\latexrelease | package>\DeclareRobustCommand\selectfont
166 <\latexrelease | package>  {%
167   <\latexrelease | package>    \ifx\f@linespread\baselinestretch \else
168   <\latexrelease | package>      \set@fontsize\baselinestretch\f@size\f@baselineskip \fi
169   <\latexrelease | package>    \xdef\font@name{%
170     \csname curr@fontshape/\f@size\endcsname}%
171   <\latexrelease | package>    \pickup@font
172   <\latexrelease | package>    \font@name
173   <\latexrelease | package>    \size@update
174   <\latexrelease | package>    \enc@update
175   <\latexrelease | package>  }
176 <\latexrelease | package>
177 <\latexrelease | package>\EndIncludeInRelease
```

\set@fontsize The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```
178 <*2ekernel | package>
179 \def\set@fontsize#1#2#3{%
180   \Q@defaultunits\Q@tempdimb#2pt\relax\Q@nnil
```

```

181      \edef\f@size{\strip@pt\@tempdimb}%
182      \@defaultunits\@tempskipa#3pt\relax\@nnil
183      \edef\f@baselineskip{\the\@tempskipa}%
184      \edef\f@linespread{\#1}%

```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```
185      \let\baselinestretch\f@linespread
```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```
186      \def\size@update{%
```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```

187      \baselineskip\f@baselineskip\relax
188      \baselineskip\f@linespread\baselineskip
189      \normalbaselineskip\baselineskip

```

then to set up a new `\strutbox`

```

190      \setbox\strutbox\hbox{%
191          \vrule\@height.7\baselineskip
192          \@depth.3\baselineskip
193          \@width\z@}%

```

We end with a bit of tracing information.

```

194  {*trace}
195  \ifnum \tracingfonts>\tw@
196      \ifx\f@linespread\empty
197          \let\reserved@a\empty
198      \else
199          \def\reserved@a{\f@linespread x}%
200      \fi
201      \font@info{Changing size to \f@size/\reserved@a
202          \f@baselineskip}%
203      \aftergroup\type@restoreinfo \fi
204 
```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```

205      \let\size@update\relax}%
206  }

```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let!`

(End of definition for `\set@fontsize`.)

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
207 \let\size@update\relax
```

(End of definition for `\size@update`.)

\type@restoreinfo This macro produces some info when a font size and/or baseline change will get restored.

```
208  {*trace}
209   \def\type@restoreinfo{%
210     \ifx\f@linespread\empty
211       \let\reserved@a\empty
212     \else
213       \def\reserved@a{\f@linespread x}%
214     \fi
215     \font@info{Restoring size to
216               \f@size/\reserved@a\f@baselineskip}}
217 }
```

(End of definition for \type@restoreinfo.)

\glb@settings The macro \glb@settings globally selects all math fonts for the current size if necessary.
\glb@currsize `218 \def\glb@settings{%`

When \glb@settings gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to \math@fonts. But this happens only if the **math@fonts** switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the **S@...** macro is not defined we have to first calculate the three sizes.

```
219   \expandafter\ifx\csname S@\f@size\endcsname\relax
220     \calculate@math@sizes
221   \fi
```

The effect of this is that \calculate@math@sizes may or may not define the **S@...** macro. In the first case the next time the same size is requested this macro is used, otherwise \calculate@math@sizes is called again. This also sets the **math@fonts** switch. If it is true we must switch the math fonts.

```
222   \csname S@\f@size\endcsname
223   \ifmath@fonts
224   {*trace}
225     \ifnum \tracingfonts>\tw@
226       \font@info{Setting up math fonts for
227                 \f@size/\f@baselineskip}\fi
228 
```

Inside a group we execute the macro for the current math *version*. This sets \math@fonts to a list of \textfont... assignments. \getanddefine@fonts (which may be called at this point) needs the \escapechar parameter to be set to -1.

```
229   \begingroup
230     \escapechar\m@ne
231     \csname mv@\math@version \endcsname
```

Then we set \globaldefs to 1 so that all following changes are done globally. The math font assignments recorded in \math@fonts are executed and \glb@currsize is set equal to \f@size. This signals that the fonts for math in this size are set up.

```
232   \globaldefs\@ne
233   \math@fonts
```

```

234         \let \glb@currsize \f@size
235         \endgroup

```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within `\globaldefs\one` as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```

236         \the\every@math@size

```

Otherwise we announce that the math fonts are not set up for this size.

```

237  {*trace}
238      \else
239          \ifnum \tracingfonts>\tw@
240              \font@info{No math setup for
241                  \f@size/\f@baselineskip}\fi
242  
```

```

243      \fi
244  }
245 
```

(End of definition for `\glb@settings` and `\glb@currsize`.)

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```

246  
```

```

247  \def\baselinestretch{1}
```

(End of definition for `\baselinestretch`.)

`\every@math@size` We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```

248  \newtoks\every@math@size
249  \every@math@size={}
250 
```

(End of definition for `\every@math@size`.)

5.2 Math fonts setup

5.2.1 Outline of algorithm for math font sizes

TeX uses the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in an enormous overhead), we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

```
$ a=b+c \mbox{ \small for all $b$ and $c\in Z$}$
```

Here the inner formulae `b` and `c\in Z` are typeset in `\small` but we have to return to `\normalsize` before we reach the closing `$` of the outer formula.

This is handled in the following way:

- At any point in the document the global variable `\glb@currsize` contains the point size for which the math fonts currently are set up.

2. Whenever we start a formula we compare its value with the local variable `\f@size` that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call `\gbl@settings` which changes the math font setup and updates `\gbl@currsize`.
 - (a) If we are recursively inside another formula (`\if@inmath`) we ensure that `\gbl@settings` is executed again in the outer formula, so that the old setup is automatically restored.
 - (b) Otherwise, we set the switch `@inmath` locally to `true` so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
 - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
 - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of `\aftergroup` commands and checks. Compared to the original algorithm this involves additional checks ($2 \times \langle \text{non-math levels} \rangle$ per inner formula).

5.2.2 Code for math font size setting

`\check@mathfonts` In the `\check@mathfonts` macros we implement the steps 2 to 4 except that instead of a switch the macro `\init@restore@glb@settings` is used.

```

251  {*2ekernel | package}
252  \def\check@mathfonts{%
253    \ifx \gbl@currsize \f@size
254    {*trace}
255      \ifnum \tracingfonts>\thr@@
256        \o@font@info{*** MATH: no change \f@size\space
257          curr/global (\curr@math@size/\gbl@currsize)}\fi
258    {*}trace}
259    \else
260    {*trace}
261      \ifnum \tracingfonts>\thr@@
262        \o@font@info{*** MATH: setting up \f@size\space
263          curr/global (\curr@math@size/\gbl@currsize)}\fi
264  {*}trace}

```

```

265      \glb@settings
266      \init@restore@glb@settings
267  \fi
268  \let\curr@math@size\f@size
269  \def\init@restore@glb@settings{\aftergroup\restglb@settings}%
270 }

(End of definition for \check@mathfonts.)
```

`\init@restore@glb@settings` This macros does by default nothing but get redefined inside `\check@mathfonts` to initiate fontsize restoring in nested formulas.

```

271 <-trace> \let\init@restore@glb@settings\relax
272 <*trace>
273 \def\init@restore@glb@settings{%
274     \ifnum \tracingfonts>\thr@@
275         \o@font@info{*** MATH: no resetting (not in
276             nested math)}\fi
277 }
278 </trace>
```

(End of definition for `\init@restore@glb@settings`.)

`\restglb@settings` This macro will be executed the first time after the current formula.

```

279 \def\restglb@settings{%
280 <*trace>
281     \ifnum \tracingfonts>\thr@@
282         \o@font@info{*** MATH: restoring}\fi
283 </trace>
284     \begingroup
285         \let\f@size\curr@math@size
286         \ifx\glb@currsize\f@size
287     <*trace>
288         \ifnum \tracingfonts>\thr@@
289             \o@font@info{*** MATH: ... already okay (\f@size)}\fi
290     </trace>
291         \else
292     <*trace>
293         \ifnum \tracingfonts>\thr@@
294             \o@font@info{*** MATH: ... to \f@size}\fi
295     </trace>
296         \glb@settings
297     \fi
298     \endgroup
299 }
```

(End of definition for `\restglb@settings`.)

5.2.3 Other code for math

`\use@mathgroup` The `\use@mathgroup` macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```
300 \def\use@mathgroup#1#2{\relax\ifmmode
```

```

301  {*trace}
302   \ifnum \tracingfonts>\tw@
303     \count@#2\relax
304     \@font@info{Using \noexpand\mathgroup
305       (\the\count@) #2}\fi
306 
```

If so we first call the ‘=’ macro (i.e. argument three) to set up special things for the selected math group. Then we call `\mathgroup` to select the group given by argument two and finally we place #1 (i.e., the argument of the `\math alphabet identifier`) at the end. This part of the code is surrounded by two commands which behave like `\begingroup` and `\endgroup` if we want `\math alphabet identifier`s but will expand into `\empty` if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a `\relax`. Otherwise something like `\mit{1}` would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

307   \math@bgroup
308     \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
309       #1\fi
310     \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the `\math alphabet identifier` isn’t called in math mode, we remove the `\fi` with the `\expandafter` trick. This is necessary if the token is actually an macro with arguments. In such a case the `\fi` will be misinterpreted as the first argument which would be disastrous.

```
311   \expandafter\math@egroup\fi}%

```

The surrounding macros equal `\begingroup` and `\endgroup`. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in `AMS-TEX` macros for placing accents.

(End of definition for `\use@mathgroup`.)

`\math@egroup` If the `margid` option is in force (which can be tested by looking at the definition of `\math@bgroup`) we change the `\math@egroup` command a bit to display the current `\math group number` after it closes the scope of `\math alphabet` with `\endgroup`.

```

312  {*trace}
313   \ifx\math@bgroup\bgroup
314     \def\math@egroup#1{\#1\egroup
315       \ifnum \tracingfonts>\tw@
316         \@font@info{Restoring \noexpand\mathgroup
317           (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
318         }\fi}
319     \fi
320 
```

(End of definition for `\math@egroup`.)

`\getanddefine@fonts` `\getanddefine@fonts` has two arguments: the `\math group number` and the `family/series/shape` name as a control sequence.

```
321 \def\getanddefine@fonts#1#2{%

```

First we turn off tracing when `\tracingfonts` is less than 4.

```
322 {+debug} \pushtracing
323 {+debug} \ifnum\tracingfonts<4 \tracingoff
324 {+debug} \else \tracingon\getanddefine@fonts \fi

325 {*trace}
326   \ifnum \tracingfonts>\tw@
327   \count@#1\relax
328     \@font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
329       \string#2 \tf@size/\sf@size/\ssf@size}\fi
330 {/trace}
```

We append the current `\tf@size` to #2 to obtain the font name.³⁶ Again, `font@name` is defined globally, for the reasons explained in the description of `\wrong@fontshape`.

```
331 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%
```

Then we call `\pickup@font` to load it if necessary. We remember the internal name as `\textfont@name`.

```
332 \pickup@font \let\textfont@name\font@name
```

Same game for `\scriptfont` and `\scriptscriptfont`:

```
333 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
334 \pickup@font \let\scriptfont@name\font@name
335 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
336 \pickup@font
```

Then we append the new `\textfont...` assignments to the `\math@fonts`.

```
337 \edef\math@fonts{\math@fonts
338   \textfont#1\textfont@name
339   \scriptfont#1\scriptfont@name
340   \scriptscriptfont#1\font@name}%

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
341 {+debug} \poptracing
342 }
343 {/2ekernel | package}
```

(End of definition for `\getanddefine@fonts`.)

6 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\@gobble` which discards the following argument, otherwise it expands to `\@firstofone` which reproduces its argument.

```
344 {*2ekernel}
345 \def\ifnot@nil#1{\def\reserved@a{#1}%
346   \ifx\reserved@a\@nil \expandafter\@gobble
347   \else \expandafter\@firstofone\fi}
```

(End of definition for `\ifnot@nil`.)

³⁶One might ask why this expansion does not generate a macro name that starts with an additional `\` character. The solution is that `\escapechar` is set to `-1` before `\getanddefine@fonts` is called.

\remove@to@nnil Three other auxiliary macros will be needed in the following: \remove@to@nnil gobbles up everything up to, and including, the next \nnil token, and \remove@angles and \remove@star do the same for the character > and *, respectively, instead of \nnil.

```
348 \def\remove@to@nnil#1\@nil{%
349 \def\remove@angles#1>{\set@simple@size@args}%
350 \def\remove@star#1*{#1}
```

(End of definition for \remove@to@nnil, \remove@angles, and \remove@star.)

\extract@sizefn This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
351 \def\extract@sizefn#1*#2\@nil{%
352   \if>#2>\set@size@funct@args#1\@nil
353     \let\sizefn@info\@empty
354   \else\expandafter\set@size@funct@args\remove@star#2\@nil
355     \def\sizefn@info{#1}\fi
356 }
```

(End of definition for \extract@sizefn.)

\try@simple@size This function tries to extract the given size (specified by \f@size) for the requested font shape. The font information must already be present in \font@info. The central macro that does the real work is \extract@fontinfo. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The corresponding font definitions have already been extracted from the macro \OT1/cm/sansserif/normal and stored in font@info. (Otherwise \extract@fontinfo doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro \extract@fontinfo to find the external font name (‘cmss12’) for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nil{%
  \set@simple@size@args#3<#4\@nil
  \execute@size@function{#2}}
```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nil
```

#1 will contain all characters before <12*>, #2 will be empty, #3 will be exactly cmss12, and #3 will be 17>cmss17. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument set to empty and its mandatory argument set to `cmss12` by `\set@simple@size@args`. As we discussed earlier, the effect of the default size function is to load the given external font (`cmss12`) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list `\font@info`. And the simple definition of `\extract@fontinfo` we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define `\extract@fontinfo` as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nil{%
  \ifnot@nil{#3}%
    {\set@simple@size@args#3<#4\@nil
     \execute@size@function{#2}%
   }%
}
```

How does this work? We call `\extract@fontinfo` via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nil
```

i.e. by appending `<12*>\@nil<\@nil`. If the size ('12' in this case) appears in `\font@info` everything works as explained above, the only difference being that argument #4 of `\extract@fontinfo` additionally gets the tokens `<12*>\@nil<\@nil`. However, if the size is not found everything up to the final `<12*>` is in argument #1, #3 gets `\@nil`, and #2 and #4 are empty. The macro `\ifnot@nil` will discard the calls to `\set@simple@size@args` and `\execute@size@function`, and hence `\font@info` will continue to be equal to `\empty`. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in `\set@simple@size@args` below.

The macros are hidden inside other control sequences so that we have to build `\extract@fontinfo` in several steps.

So here's the actual definition of `\extract@font` in `\try@simple@size`.

```
357 % % this could be replaced by \try@size@range making the subst slower!
358 \def\try@simple@size{%
```

`\reserved@a` is made an abbreviation for the head of the definition of the macro `\extract@fontinfo`.

```
359 \def\reserved@a{\def\extract@fontinfo####1}{%
```

Now we can define `\extract@fontinfo`. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the * character.

```
360 \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nil{%
361   \ifnot@nil{##2}%
362     {\set@simple@size@args##2<##3\@nil
363       \execute@size@function\sizefn@info
364     }%
}
```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```
365   \expandafter\expandafter
366   \expandafter\extract@fontinfo\expandafter\font@info
367   \expandafter<\f@size>\@nil<\@nil
368 }
```

(End of definition for \try@simple@size.)

- \set@simple@size@args As promised above, the macro \set@simple@size@args will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character <. By starting the definition as follows,

369 \def\set@simple@size@args#1<{%

parameter #1 is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character < cannot appear in #1) by calling \remove@angles for empty #1 and \extract@sizefn otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by \remove@to@nnil. Note also the use of Kabelschacht's method.

370 \if<#1<%
371 \expandafter\remove@angles
372 \else
373 \extract@sizefn#1*\@nil
374 \expandafter\remove@to@nnil
375 \fi}

(End of definition for \set@simple@size@args.)

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macros for extraction of size range specification.

- \extract@rangefontinfo \extract@rangefontinfo goes through a font shape definition in the input until it recognizes the tokens <\@nil->. It looks for font ranges with font size functions. Its operation is rather simple: it discards everything up to the next size specification and passes this on to \is@range for inspection. The specification (parameter #2) is inserted again, in case it is needed later.

376 \def\extract@rangefontinfo#1<#2>{
377 \is@range#2->\@nil#2>}

(End of definition for \extract@rangefontinfo.)

- \is@range \is@range is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls \extract@rangefontinfo to continue the search. Otherwise it calls \check@range to check the requested size against the specified range.

From the way \is@range is called inside \extract@rangefontinfo we see that #2 is the character > if the size specification found is a simple one (that does not contain a - character). This is checked easily enough and \extract@rangefontinfo called again. Note that the extra tokens inserted after the \@nil in the call to \is@range appear at the beginning of the first argument to \extract@rangefontinfo and are hence ignored.

378 \def\is@range#1-#2\@nil{
379 \if>#2\expandafter\check@single\else
380 \expandafter\check@range\fi}

(End of definition for \is@range.)

- \check@range \check@range takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token \@nil \font@info is exhausted and we can stop searching.

381 \def\check@range#1-#2>#3<#4\@nnil{
382 \ifnot@nil{#3}{%

If #3 wasn't `\cnil` we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an `<` as it was already removed by scanning.

```
383     \def\reserved@f{\extract@rangefontinfo<#4\cnil}%
```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If `\upper@bound` is zero after the assignment we set it to `\maxdimen` (upper open range). We need to use a `\dimen` register for the scan since we may have a decimal number as the boundary.

```
384     \upper@bound0#2\p@
385     \ifdim\upper@bound=\z@\ \upper@bound\maxdimen\fi
```

Now we check the upper boundary against `\f@size`. If it is larger or equal than `\f@size` this range is no good and we have to recurse.

```
386     \ifdim \f@size \p@<\upper@bound
```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in `1pt` as default lower boundary. If `\f@size` is smaller than the boundary we have to recurse.

```
387     \lower@bound0#1\p@
388     \ifdim \f@size \p@<\lower@bound
389     \else
```

If both tests are passed we can try executing the size function.

```
390     \set@simple@size@args#3<#4\cnil
391     \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
392     \ifx\external@font\empty
393     \else
394     \let\reserved@f\empty
395     \fi
396     \fi
397     \fi
398     \reserved@f}}
```

(End of definition for `\check@range`.)

`\lower@bound` We use two dimen registers `\lower@bound` and `\upper@bound` to store the lower and upper endpoints of the range we found.

```
399 \newdimen\lower@bound
400 \newdimen\upper@bound
```

(End of definition for `\lower@bound` and `\upper@bound`.)

`\check@singl` `\check@singl` takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
401 \def\check@singl#1>#2<#3\cnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an `<` as it was already removed by scanning.

```
402     \def\reserved@f{\extract@rangefontinfo<#3\cnil}%
```

Now we check the size against `\f@size`. If it is not equal `\f@size` it is no good and we have to recurse.

```
403     \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
404     \set@size@size@args#2<#3\@nil
405         \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
406     \ifx\external@font\@empty
407     \else
408         \let\reserved@f\@empty
409     \fi
410 \fi
411 \reserved@f}
```

(End of definition for `\check@single`.)

`\set@size@funct@args` This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token `\@nil`.

```
412 \def\set@size@funct@args{\@ifnextchar[%%
413   \set@size@funct@args@{\set@size@funct@args@[]}}
414 \def\set@size@funct@args@[#1]#2\@nil{%
415   \def\mandatory@arg{#2}%
416   \def\optional@arg{#1}%
417 }
```

(End of definition for `\set@size@funct@args` and `\set@size@funct@args@`.)

`\DeclareSizeFunction` This function defines a new size function hiding the internal from the designer. The body of the size function may use `\optional@arg` and `\mandatory@arg` denoting the optional and mandatory argument that may follow the size specification `<...>`.

```
418 {*2ekernel}
419 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
420 \@onlypreamble\DeclareSizeFunction
421 }
```

(End of definition for `\DeclareSizeFunction`.)

`\execute@size@function` This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a `\relax`).

```
422 {*2ekernel | package}
423 \def\execute@size@function#1{%
424   <*trace>
425     \@ifundefined{s@fct@#1}%
426       {\errmessage{Undefined font size function #1}%
427        \s@fct@}%
428       {\csname s@fct@#1\endcsname}%
429   </trace>
430   {-trace}      \csname s@fct@#1\endcsname
431 }
432 }
```

(End of definition for \execute@size@function.)

- \try@size@range This macro tries to find a suitable range for requested size (specified by \f@size) in \font@info. All the relevant action is done in \extract@rangefontinfo. All that needs to be done is to stuff in the token list in \font@info so that \extract@rangefontinfo can inspect it. Note the <-*\@nil> token at the end to stop scanning.

```
433  {*2ekernel}
434  \def\try@size@range{%
435    \expandafter\extract@rangefontinfo\font@info <-*>\@nil<\@nnil
436 }
```

(End of definition for \try@size@range.)

- \try@size@substitution This is the last thing that can be tried. If the desired \f@size is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```
437 \gdef\try@size@substitution{%
```

First we do some initializations. \tempdimb will hold the difference between the wanted size and the best solution found so far, so we initialise it with \maxdimen. The macro \best@size will hold the best size found, nothing found is indicated by the empty value.

```
438   \tempdimb \maxdimen
439   \let \best@size \empty
```

Now we loop over the specification

```
440   \expandafter \try@simples \font@info <\number\@M\@nil<\@nnil
441 }
```

(End of definition for \try@size@substitution.)

- \font@submax \fontsubfuzz The macro \font@submax records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at \end{document}. The macro \fontsubfuzz contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```
442 \def\font@submax{0pt}
443 \def\fontsubfuzz{.4pt}
444 /2ekernel}
445 (+package)\def\fontsubfuzz{0pt}
```

(End of definition for \font@submax and \fontsubfuzz.)

- \try@simples \try@simples goes through a font shape definition in the input until it recognizes the tokens <*\@nil>. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```
446 {*2ekernel}
447 \gdef\try@simples#1<#2>{%
448   \tryif@simple#2->\tryif@simple}
```

(End of definition for \try@simples.)

\tryis@simple \tryis@simple is similar to \is@range. If it sees a simple size, it checks it against the value of \f@size and sets \lower@font@size or \higher@font@size. In the latter case, it stops the iteration. By adding <\number@M> at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```
449 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for \reserved@f first:

```
450 \let \reserved@f \try@simples
451 \if>#2%
```

If so, it compares it to the value of \f@size. This is done using a dimen register since there may be fractional numbers.

```
452 \dimen@ #1\p@
453 \ifdim \dimen@<\OM\p@
```

If \dimen@ is \OM\p@ we have reached the end of the fontspec (hopefully) otherwise we compare the value with \f@size and compute in \tempdimc the absolute value of the difference between the two values.

```
454 \ifdim \f@size\p@<\dimen@
455   \tempdimc \dimen@
456   \advance\tempdimc -\f@size\p@
457 \else
458   \tempdimc \f@size\p@
459   \advance\tempdimc -\dimen@
460 \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in \tempdimc is smaller) we have found a size which is a better approximation so we make it the \best@size and adjust \tempdimb.

```
461 \ifdim \tempdimc<\tempdimb
462   \tempdimb \tempdimc
463   \def \best@size{#1}%
464 \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called \subst@size.

```
465 \else
```

This macro substitutes the size recorded in \best@size for the unavailable size \f@size. \font@submax records the maximum difference between desired size and selected size in the whole run.

```
466 % %\subst@size          %% coded inline
467 % %\def\subst@size{%
468 \ifx \external@font\empty
469   \ifx \best@size\empty
470   \else
471     \ifdim \tempdimb>\font@submax \relax
472       \xdef \font@submax {\the\tempdimb}%
473     \fi
474   \let \f@user@size \f@size
475   \let \f@size \best@size
```

```

476      \ifdim \tempdime>\fontsubfuzz\relax
477          \font@warning{Font\space shape\space
478              '\curr@fontshape'\space in\space size\space
479              <\f@user@size>\space not\space available\MessageBreak
480              size\space <\f@size>\space substituted}%
481      \fi
482      \try@simple@size
483      \do@subst@correction
484  \fi
485 \fi
486 % %}

```

This brings us back into the main part of `\tryif@simple`. Finally we get rid of any rubbish left over on the input stack.

```

487      \let \reserved@f \remove@to@nnil
488      \fi
489  \fi

```

If it's a range iterate also.

```
490  \reserved@f}
```

(End of definition for `\tryis@simple` and `\subst@size`.)

6.1 Sizefunctions

In the following we define some useful size functions.

- `\s@fct@`** This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

491 \DeclareSizeFunction{}{\empty@sfcnt\font@warning}
492 \DeclareSizeFunction{s}{\empty@sfcnt\font@info}
493 \def\empty@sfcnt#1{%
494     \tempdime \f@size\p@
495     \ifx\optional@arg\empty
496     \else
497         \tempdime \optional@arg\tempdime
498         #1{Font\space shape\space '\curr@fontshape'\space
499             will\space be\MessageBreak
500             scaled\space to\space size\space \the\tempdime}%
501     \fi
502     \edef\external@font{\mandatory@arg\space at\the\tempdime}}

```

(End of definition for `\s@fct@`.)

- `\s@fct@gen`** This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

503 \DeclareSizeFunction{gen}{\gen@sfcnt\font@warning}
504 \DeclareSizeFunction{sgen}{\gen@sfcnt\font@info}

```

```

505 \def\gen@sfcnt{%
506   \edef\mandatory@arg{\mandatory@arg\f@size}%
507   \empty@sfcnt}

```

(End of definition for `\s@fct@gen` and `\s@fct@sgen`.)

- `\s@fct@genb` This size function is similar to `gen`, but for fonts where the size is encoded in the font name in centipoins, as in the DC fonts version 1.2. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

508 \DeclareSizeFunction{genb}{\genb@sfcnt \@font@warning}
509 \DeclareSizeFunction{sgenb}{\genb@sfcnt \@font@info}
510 \def\genb@sfcnt{%
511   \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@C}%
512   \empty@sfcnt}

```

(End of definition for `\s@fct@genb` and `\s@fct@sgenb`.)

- `\genb@x` The auxiliary macros `\genb@x` and `\genb@y` are used to convert the `\f@size` into centi-points.

```

513 \def\genb@x#1.#2.#3\@{\two@digits{#1}\genb@y#200\@}
514 \def\genb@y#1#2#3\@{\#1#2}

```

(End of definition for `\genb@x` and `\genb@y`.)

- `\s@fct@sub` This size function handles font substitution. The mandatory argument is a family/series/shape combination, the optional argument (if present) is ignored. The font encoding scheme cannot be changed. Therefore, the first thing we do is to prepend the encoding scheme.

```

515 \DeclareSizeFunction{sub}{\sub@sfcnt \@font@warning}
516 \DeclareSizeFunction{ssub}{\sub@sfcnt \@font@info}
517 \def\sub@sfcnt#1{%
518   \edef\mandatory@arg{\f@encoding/\mandatory@arg}%

```

Next action is split the arg into its individual components and allow for a late font shape load.

```

519 \begingroup
520   \expandafter\split@name\mandatory@arg/\@nil
521   \try@load@fontshape
522 \endgroup

```

Then we record the current `\f@size` since it may get clobbered.

```

523 \let\f@user@size\f@size

```

Then we check whether this new combination is defined and give an error message if not. In this case we also switch to `\error@fontshape`.

```

524 \expandafter
525 \ifx\csname\mandatory@arg\endcsname\relax
526   \errmessage{No\space declaration\space for\space
527               shape\space \mandatory@arg}%
528   \error@fontshape
529 \else

```

Otherwise we warn the user about the substitution taking place.

```
530     #1{Font\space shape\space '\curr@fontshape'\space in\space
531         size\space <\f@size>\space not\space available\MessageBreak
532         Font\space shape\space '\mandatory@arg'\space tried\space
533         instead}%
534     \expandafter\split@name\mandatory@arg/\@nil
535     \fi
```

Then we restart the font specification scan by calling `\get@external@font`.

```
536     \edef\f@size{\f@user@size}%
537     \get@external@font
```

Finally `\do@subst@correction` is called to get the font name right.

```
538     \do@subst@correction
539 }
```

(End of definition for `\s@fct@sub`.)

`\@font@aliasinfo` Sometimes a substitution is only done to map a long font name to a standard shape or series, e.g.,

```
DeclareFontShape{T1}{Roboto-LF}{b}{it}{<-> alias * Roboto-LF/bold/it}{}
```

Using the `ssub` function in that case will give a strange (and incorrect) warning. As an alternative we therefore offer the size function `alias`. It will still add some info into the `.log` file, but no longer complains that the font shape is not available. It is implemented by grabbing the default warning text and replacing it with a new one.

```
540 </2ekernel>
541 <*2ekernel | latexrelease>
542 <latexrelease> \IncludeInRelease{2020/02/02}%
543 <latexrelease> {\@font@aliasinfo}{alias size function}%
544 \DeclareSizeFunction{alias}{\sub@sfcnt@\font@aliasinfo}
545 \def@\font@aliasinfo#1{%
546   \@font@info{Font\space shape\space '\curr@fontshape'\space
547   aliased\space to\MessageBreak '\mandatory@arg'}%
548 }
549 </2ekernel | latexrelease>
550 <latexrelease> \EndIncludeInRelease
551 <latexrelease> \IncludeInRelease{0000/00/00}%
552 <latexrelease> {\@font@aliasinfo}{alias size function}%
553 <latexrelease> \let\s@fct@alias@\undefined
554 <latexrelease> \let@\font@aliasinfo@\undefined
555 <latexrelease>
556 <latexrelease> \EndIncludeInRelease
557 <*2ekernel>
```

(End of definition for `\@font@aliasinfo`.)

`\s@fct@subf` The `subf` size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
558 \DeclareSizeFunction{subf}{\subf@sfcnt@\font@warning}
559 \DeclareSizeFunction{ssubf}{\subf@sfcnt@\font@info}
```

```

560 \def\subf@sfcnt#1{%
561   #1{Font\space shape\space '\curr@fontshape'\space in\space
562     size\space \f@size\space not\space available\MessageBreak
563     external\space font\space '\mandatory@arg'\space used}%
564   \empty@sfcnt#1%
565 }

```

(End of definition for \s@fct@subf.)

- \s@fct@fixed The **fixed** size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```

566 \DeclareSizeFunction{fixed}{\fixed@sfcnt@\font@warning}
567 \DeclareSizeFunction{sfixed}{\fixed@sfcnt@\font@info}
568 \def\fixed@sfcnt#1{%
569   \ifx\optional@arg\empty
570     \let\external@font\mandatory@arg
571   \else
572     \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
573   \fi
574   #1{External\space font\space '\external@font'\space loaded\space
575     for\space size\MessageBreak
576     <\f@size>}%
577 }
578 \end{2ekernel}

```

(End of definition for \s@fct@fixed.)

File 27

ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original ‘NFSS1’ release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was “current” only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via `latexrelease` package so that backward compatibility remains ensured for very old documents.

```
1  {*latexrelease}
2  \IncludeInRelease{2015/01/01}{\new@fontshape}%
3  {NFSS version1 commands}%
4  \let\new@fontshape@undefined
5  \let\warn@rel@i@undefined
6  \let\scan@fontshape@undefined
7  \let\scan@@fontshape@undefined
8  \let\subst@fontshape@undefined
9  \let\extra@def@undefined
10 \let\default@mextra@undefined
11 \let\preload@sizes@undefined
12 \let\err@rel@i@undefined
13 \let\newmathalphabet@undefined
14 \let\newmathalphabet@undefined
15 \let\newmathalphabet@@@@undefined
16 \let\if@no@font@opt@undefined
17 \let@no@font@optfalse@undefined
18 \let\define@mathalphabet@undefined
19 \let\define@mathgroup@undefined
20 \let\addtoversion@undefined
21 \EndIncludeInRelease
```

In older releases we provide the original definitions.

```
22 \IncludeInRelease{0000/00/00}{\new@fontshape}%
23 {NFSS version1 commands}%
```

`\new@fontshape` The interface is now `\DeclareFontShape`.

```
24 \gdef\new@fontshape#1#2#3#4{%
25   \warn@rel@i\new@fontshape\DeclareFontShape
26   \expandafter\scan@fontshape\@gobble#4<\@nil><<%
27   \DeclareFontShape U{#1}{#2}{#3}\reserved@f}%
28 \onlypreamble\new@fontshape
```

(End of definition for `\new@fontshape`.)

`\warn@rel@i` The warning message used above.

```
29 \gdef\warn@rel@i#1#2{%
30   \font@warning{*** NFSS release 1 command}
```

```

31           \noexpand#1found\MessageBreak
32   *** Update by using release 2 command
33           \string#2.\MessageBreak
34   *** Recovery is probably possible}%
35 }%
36 \onlypreamble\warn@rel@i

```

(End of definition for \warn@rel@i.)

\scan@fontshape This will scan the old font shape definition syntax.

```

37 \gdef\scan@fontshape{%
38   \let\reserved@f\empty
39   \let\reserved@e\empty %      holds last info
40   \scan@@fontshape
41 }%
42 \onlypreamble\scan@fontshape

```

(End of definition for \scan@fontshape.)

\scan@@fontshape

```

43 \gdef\scan@@fontshape#1>#2#3<%
44   \ifx\@nil#1%
45     \edef\reserved@f{\reserved@f\reserved@e}%

77  \fi
78 }%
79 \onlypreamble\scan@@fontshape

```

(End of definition for `\scan@@fontshape`.)

`\subst@fontshape` This is now also handled by the extend syntax of `\DeclareFontShape`.

```

80 \gdef\subst@fontshape#1#2#3#4#5#6{%
81   \warn@rel@i\subst@fontshape\DeclareFontShape
82   \DeclareFontShape{U}{#1}{#2}{#3}{<->sub*#4/#5/#6}{()}%
83 \onlypreamble\subst@fontshape

```

(End of definition for `\subst@fontshape`.)

`\extra@def` This was replaced by `\DeclareFontFamily`.

```

84 \gdef\extra@def#1#2#3{%
85   \warn@rel@i\extra@def\DeclareFontFamily
86   \DeclareFontFamily{U}{#1}{()}%
87 }%
88 \onlypreamble\extra@def

```

(End of definition for `\extra@def`.)

`\default@mextra` The new name is `\DeclareFontEncodingDefaults` but in this case we don't feel comfortable with this either.

```

89 \gdef\default@mextra{%
90   \warn@rel@i\default@mextra\DeclareFontEncodingDefaults

```

We pick up the argument to `\default@mextra` implicitly as the second argument of `\DeclareFontEncodingDefaults`.

```

91   \DeclareFontEncodingDefaults\relax
92 }%
93 \onlypreamble\default@mextra

```

(End of definition for `\default@mextra`.)

`\preload@sizes` The new interface is `\DeclarePreloadSizes`.

```

94 \gdef\preload@sizes{%
95   \warn@rel@i\preload@sizes\DeclarePreloadSizes
96   \DeclarePreloadSizes U%
97 }%
98 \onlypreamble\preload@sizes

```

(End of definition for `\preload@sizes`.)

`\err@rel@i` This macro is used in cases where emulation with NFSS2 features is not really possible.

```

99 \gdef\err@rel@i#1#2{%
100   \o@late@error{*** NFSS release 1 command \noexpand#1found%
101     ^^J*** Recovery not possible. Use \string#2}%
102   {The new release of NFSS doesn't support the
103     \noexpand#1command^^Jany longer.
104     Please upgrade your file to the syntax of NFSS
105     release 2^^Jusing the \noexpand#2command.}%

```

Let's die.

```

File 28

ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

1 Interface Commands

```
1  {*2ekernel}
2  \message{NFSS declarative interface,}

\in@ \Cin is a utility macro with two arguments. It determines whether its first argument
\ifin@ occurs in its second and sets the switch \ifin@ accordingly. The first argument may not
contain braces nor # (more precisely, tokens of category code 1, 2, or 6).
3  \def\in@#1#2%
4  {%
5    \begingroup
6      \def\in@@##1#1{%
7        \toks@\expandafter{\in@@#2{}{}#1}%

14     \fi
15   }
16 \newif\ifin@
```

(End of definition for \in@ and \ifin@.)

Before the \begin{document} command several *math versions* and *math alphabet identifiers* may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

- the list of all math versions, \version@list, each entry prefixed by the control sequence \version@elt, i.e. this list has the following form

$$\text{\version@elt}\langle\text{version}_1\rangle\text{\version@elt}\langle\text{version}_2\rangle\dots\text{\version@elt}\langle\text{version}_n\rangle$$

- the list of all math alphabet identifiers. Here every entry has the form:

$$\text{\group@elt}\langle\text{math group number}\rangle\{\{\langle\text{default family}\rangle\}\{\langle\text{default series}\rangle\}\{\langle\text{default shape}\rangle\}\}.$$

- Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

```
\set@alpha{the alphabet identifier itself}
\reserved@c<math version><font info>
...
\@nil
```

where ** is either `\reserved@e` (if the combination is not defined yet) or

```
{<family>}{<series>}{{<shape>}}}
```

`\version@list` We initialize the version list to be empty.

```
17 \let\version@list=\@empty
18 \@onlypreamble\version@list
```

(*End of definition for \version@list.*)

`\version@elt`

```
19 \let\version@elt\relax
20 \@onlypreamble\version@elt
```

(*End of definition for \version@elt.*)

`\new@mathversion` The macro `\new@mathversion` is called with the version control sequence as its argument.

```
21 \%def\new@mathversion#1{%
```

The first thing this macro does is to check if the version identifier is already present in `\version@list`. We enclose `\version@list` in braces since it might be empty (if no *version* is defined yet). But this means that we need a suitable number of `\expandafter` primitives.

```
22 \% \expandafter\in@\expandafter#1\expandafter{\version@list}%
23 \% \ifin@
```

If so it prints an error message. The `\next` macro is used to get rid of the four characters `\mv@` that would otherwise appear at the begin of the version name in the error message.

```
24 \% \@latex@error{Math version
25 \%           '\expandafter@gobblefour\string#1'
26 \%           already defined}\@eha
```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to `\version@list`. This is very easy: we define `\version@elt` (which is the delimiter in `\version@list`) to protect itself and the following token from being expanded and simply redefine `\version@list`.

```
27 \% \else
28 \%   \global\expandafter\newcount\csname c@\expandafter
29 \%           '\@gobble\string#1\endcsname
30 \%   \global\csname c@\expandafter
31 \%           '\@gobble\string#1\endcsname\@ne
32 \%   \def\version@elt{\noexpand\version@elt\noexpand}%
33 \%   \edef\version@list{\version@list\version@elt#1}%

```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use `\reserved@c` as delimiter, and that there appears the control sequence `\reserved@e` that must not be expanded. Therefore we take suitable precautions.

```
34 %     \def\reserved@c{\noexpand\reserved@c\noexpand}%
35 %     \let\reserved@e\relax
```

We will now go through the `\alpha@list` to process every *<math alphabet identifier>* in turn. Since this list has `\group@elt` as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
36 %     \def\group@elt##1##2##3{%
```

The first of these arguments is the *<math alphabet identifier>*. We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for `\reserved@c` and `\reserved@e` made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro `\remove@nil` which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
37 %     \edef##1{\expandafter\remove@nil##1%
38 %             \reserved@c
39 %             #1%
40 %             \reserved@e
41 %             \noexpand\@nil}}%
```

Finally we call `\alpha@list` which will now execute the macro `\group@elt` once for every defined *<math alphabet identifier>*. And that's all for now.

```
42 %     \alpha@list
43 %   \fi}
```

(End of definition for `\new@mathversion`.)

`\alpha@list` As we explained above every entry in `\alpha@list` has the form

```
\alpha@elt
<alphabet identifier><internal group number><default font assignments>...
```

We initialize it to `\empty`.

```
44 \let\alpha@list\empty
45 \onlypreamble\alpha@list
```

(End of definition for `\alpha@list`.)

`\alpha@elt`

```
46 \let\alpha@elt\relax
47 \onlypreamble\alpha@elt
```

(End of definition for `\alpha@elt`.)

`\newgroup` Start the group (fam) allocation at 0. (Doesn't belong here.)

```
48 \count18=-1
```

(End of definition for `\newgroup`.)

`\stepcounter`

(End of definition for `\stepcounter`.)

\select@group We surround \select@group with braces so that functions using it can be used directly after _ or ^. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if \math@bgroup is not \bgroup) we need to get rid of the extra group.

```

`\c@localmathalphabets` To avoid hitting the “no more math fams available” limit of 16, we keep a defined number of math alphabets flexible/local. If we have to allocate any of those we roll back the allocation after the formula has ended, so the next formula can use other alphabets in the slot(s). This makes the processing a bit slower if you are working at the limit, but that is better than dying with “out of memory”.

```

138  </2ekernel>
139  <|latexrelease>\IncludeInRelease{2021/11/15}
140  <|latexrelease>  {\document@select@group}{\document@select@group}%
141  {*2ekernel | latexrelease}

```

We don’t really undo the declaration on rollback (as that would be hard to maintain), so rolling forward needs to check if the declaration was already made.

```
142  \ifx\c@localmathalphabets\undefined
```

There is no need to have this counter as part of the include checkpoints, given that it makes little sense to alter its settings mid document. All we want is the ability to change it using the `\setcounter` interface.

By default we keep two math fams flexible.

```

143  \newcount\c@localmathalphabets
144  \setcounter{localmathalphabets}{2}
145  \fi

```

(End of definition for `\c@localmathalphabets`.)

`\document@select@group` The `\document@select@group` command is the version of `\select@group` (inside math versions) that is used in the document body to set up math alphabets (if used).

```

146  \def\document@select@group#1#2#3#4{%
147  \ifx\math@bgroup\math@bgroup\else\relax\expandafter\@firstofone\fi
148  {%
149  \ifmmode

```

We first check if there is still room for allocating another mathgroup. If there is, we check if it can be globally allocated or if we have reached the limit which is given by `\e@mathgroup@top` with `\c@localmathalphabets` subtracted.

```

150  \ifnum\csname c@mv@\math@version\endcsname<\e@mathgroup@top
151  \ifnum \numexpr\mathgroup@top-\c@localmathalphabets
152  >\csname c@mv@\math@version\endcsname
153  \else

```

If we are past this point we freeze the current state of the math version so that we can return to it after the formula has ended. Of course, that should be done only once, so we check if `\mv@<version>@frozen` already exists.

```
154  \ifcsname mv@\math@version @frozen\endcsname \else
```

We have to pass the current value of `\math@version` not the macro itself, because some of the processing is delayed to a point where the value may have changed again—not doing this caused a puzzling error in one setup.

```

155  \expandafter\freeze@math@version\expandafter{\math@version}%
156  \fi
157  \fi
158  \begingroup
159  \escapechar\m@ne

173     \@eha
174 \fi

```

Extra \expandafter to remove the \expandafter added below

```
175 \else \expandafter\expandafter\expandafter\non@alpherr\fi
```

We surround \select@group with braces so that functions using it can be used directly after _ or ^.

If the legacy interface is used, e.g., \$ $\$sf -1$$ the math alphabet #1 does not take an argument so we better do not surround #4 with braces, because then we get {\relax} into the formula and introduce an extra Ord atom. The two different cases can be distinguished by looking at the current value of \math@bgroup.

```

293  \@font@info{ Undo~ math~ alphabet~ allocation~ in~ version~ #1 }

```

If the undo is necessary, we restore the `\mv@<version>` code.

```

294  \cs_gset_eq:cc { mv@#1 }{ mv@#1@frozen }
295  \int_gset:cn { c@mv@#1 }{ \tl_use:c {g__nfss_frozen_mv_ #1 _tl} }

```

But we also should undo changes to the top-level math alphabet definitions. We therefore run this code with a modified definition for `\getanddefine@fonts` because there is no need to do anything to the symbol fonts that are permanently allocated. However, we do this only if the resetting was for the current math version, because otherwise we would give the top-level definitions the values for the last math version being resetted (e.g., bold if there are just two).

```

296          \t1_if_eq:NnTF \math@version {#1}
297          {
298              \group_begin:
299                  \cs_set_eq:NN \getanddefine@fonts \use_none:nn
300                  \use:c {mv@ \math@version }
301              \group_end:
302          }
303      {

```

Once we have hit the boundary and have to revert to the frozen version that happens quite often, but typically only for the normal version. Thus, it is better to report only when we do not revert the top-level definition as this is the exceptional case and happens only if several math versions are used in parallel.

```

304          \c@font@info{ ...~ but~ do~ not~ reset~ the~
305                          top-level~ math~ alphabet~ definitions }
306          }
307      }
308  {

```

If there was no change, we report that in the log (but this branch could go completely).

```

309          \c@font@info{ No~ math~ alphabet~ change~
310                          to~ frozen~ version~ #1 }
311      }
312  }
313  {
314      \c@font@info{ Nested~ math:~ keeping~ math~ alphabet~
315                          allocation~ in~ version~ #1}
316  }

```

If this is executed after a math display, we may have to arrange for ignoring spaces, because they are now hidden if the tokens from above intervene. This is signaled by the 2e switch `@ignore` which is set in `\frozen@everymath` and `\frozen@everydisplay`.

This is all 2e code so we use that syntax.

```

988 \onlypreamble\DeclareMathDelimiter

(End of definition for \DeclareMathDelimiter.)
```

\xxDeclareMathDelimiter This macro checks if the second arg is a “math type” such as `\mathopen`. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```
989 \def\xxDeclareMathDelimiter#1#2#3#4{%
```

7 is the default value returned in the case that `\mathchar@type` is passed something unexpected, like a math symbol font name. We locally move `\mathalpha` out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```

990  \begingroup
991  \let\mathalpha\mathord
992  \ifnum7=\mathchar@type{#2}%
993  \endgroup

```

If this branch is taken we have old syntax (5 arguments).

```

994  \expandafter\@firstofone
995  \else

```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```

996  \endgroup
997  \DeclareMathSymbol{#1}{#2}{#3}{#4}%

```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

```

1192     \csname \expandafter\gobble\string#1\space\endcsname{#2}#1}
1193 \onlypreamble\DeclareSymbolFontAlphabet

(End of definition for \DeclareSymbolFontAlphabet.)

```

```

\DeclareSymbolFontAlphabet@
1194 \def\DeclareSymbolFontAlphabet@#1#2#3{%
We use the switch \if@tempswa to decide if we can declare this symbol font alphabet.
1195   \if@tempswatrue

```

First check if #2 is known to be a symbol font

```
1196     \expandafter\in@\csname sym#2\expandafter\endcsname
1197         \expandafter{\group@list}%
1198 \ifin@
```

Check if #1 is defined as a math alphabet defined via \DeclareMathAlphabet:

```
1199     \expandafter\in@\expandafter#\expandafter{\alpha@list}%
1200 \ifin@
```

If so remove it from the \alpha@list and from all math version macros.

```
1201     @font@info{Redeclaring math alphabet \string#3}%
1202     \toks@{}%
1203     \def\alpha@elt##1##2##3{%
1204         \ifx##1#1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
1205     \alpha@list
1206     \xdef\alpha@list{\the\toks@}%
```

Now we loop over all versions and remove the math alphabet:

```
1207     \def\version@elt##1{%
1208         \begingroup
1209             \toks@{}%
1210             \def\getanddefine@fonts####1####2{%
1211                 \addto@hook\toks@{\getanddefine@fonts####1####2}}%
1212             \def\install@mathalphabet####1####2{%
1213                 \ifx####1#1\else
1214                     \addto@hook\toks@{\install@mathalphabet
1215                         ####1{####2}}\fi}%
1216                 ##1%
1217                 \xdef##1{\the\toks@}%
1218             \endgroup
1219         }%
1220     \version@list
1221 \else
```

If #3 is not defined as a math alphabet check if it is defined at all:

```
1222     \expandafter\ifx
1223         \csname\expandafter\gobble\string#1\space\endcsname
1224         \relax
```

If it is undefined, fine otherwise check if it is a math alphabet defined via \DeclareSymbolFontAlphabet:

```
1225     \else
1226         \edef\reserved@a{%
1227             \noexpand\in@\string\use@mathgroup}{\meaning#1}%
1228         \reserved@a
1229         \ifin@
1230             @font@info{Redeclaring math alphabet \string#3}%
1231         \else
```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```
1232         \tempswafalse
1233         @latex@error{Command '\string#3' already defined}@\eha
1234         \fi
1235         \fi
1236         \fi
1237     \else
```

Since the symbol font is not known we better skip defining this alphabet.

```
1238     \@tempswafalse
1239     \@latex@error{Unknown symbol font '#2'}\@eha
1240     \fi
1241     \if@tempswa
```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup <math-settings> \sym<name>
```

The `<math-settings>` are the one for the encoding that is used in the font shape where `\sym<name>` is pointing to. This means that we have to get it from the information stored in `\group@list`. Thus we loop through that list after defining `\group@elt` in a suitable way.

```
1242     \def\group@elt##1##2{%
1243         \expandafter\ifx\csname sym#2\endcsname##1%
1244         \expandafter\reserved@a\string##2\@nil
1245         \fi}%
1246     \def\reserved@a##1##2##3\@nil{%
1247         \def\reserved@a{##2}}%
1248     \group@list
1249     \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%
1250     \edef#1{\the\toks@
1251         \noexpand\use@mathgroup
1252         \expandafter\noexpand\csname M@\reserved@a\endcsname
1253         \csname sym#2\endcsname}%
1254     \def#3{\protect#1}%
1255     \fi
1256 }
1257 \onlypreamble\DeclareSymbolFontAlphabet@
1258 {/2ekernel}
```

(End of definition for `\DeclareSymbolFontAlphabet@`.)

File 29

ltfssini.dtx

This file contains the top level L^AT_EX interface to the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

1 NFSS Initialization

Finally, there are six commands that are to be used in L^AT_EX and that we will therefore protect against expansion at the wrong point: \fontfamily, \fontseries, \fontshape, \fontsize, \selectfont, and \mathversion.

```
1  {*2ekernel}
2  \message{NFSS initialization,}
```

1.1 Providing math *versions*

L^AT_EX provides two *versions*. We call them **normal** and **bold**, respectively.

```
3  \DeclareMathVersion{normal}
4  \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of \rmfamily etc. in math mode.

(Actually most are now defined further down in the file.)

First the changes to another *family*:

```
5  \%{\!}\ DeclareRobustCommand{\rmfamily
6  %      {\not@math@\alphabet\rmfamily\mathrm
7  %      \fontfamily\rmdefault\selectfont}
8  \%{\!}\ DeclareRobustCommand{\sffamily
9  %      {\not@math@\alphabet\sffamily\mathsf
10 %      \fontfamily\sfdefault\selectfont}
11 \%{\!}\ DeclareRobustCommand{\ttfamily
12 %      {\not@math@\alphabet\ttfamily\mathtt
13 %      \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
14 \%{\!}\ DeclareRobustCommand{\bfseries
15 %      {\not@math@\alphabet\bfseries\mathbf
16 %      \fontseries\bfdefault\selectfont}
17 \%{\!}\ DeclareRobustCommand{\mdseries
18 %      {\not@math@\alphabet\mdseries\relax
19 %      \fontseries\mddefault\selectfont}
20 \%{\!}\ DeclareRobustCommand{\upshape
21 %      {\not@math@\alphabet\upshape\relax
22 %      \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
23 \%{\!}\ DeclareRobustCommand{\slshape
24 %      {\not@math@\alphabet\slshape\relax
25 %      \fontshape\sldefault\selectfont}
26 \%{\!}\ DeclareRobustCommand{\scshape
```

```

27      {\not@math@alphabet\scshape\relax
28          \fontshape\scdefault\selectfont}
29 \DeclareRobustCommand\itshape
30     {\not@math@alphabet\itshape\mathit
31         \fontshape\itdefault\selectfont}

```

2 Custom series settings for main document families

This section was introduced 2020/02/02 and for now we support a full rollback (may need splitting later).

```

32 </2ekernel>
33 {*2ekernel | latexrelease}
34 {latexrelease}\IncludeInRelease{2021/11/15}%
35 {latexrelease} {\DeclareFontSeriesDefault}{Custom series}%

```

One problem with the NFSS approach of handling the series axis turned out to be that (especially with respect to “boldness”) different font families implemented different strategies. For example, with Computer Modern fonts you normally only have `bx` whereas most PostScript fonts offered only `b` but not `bx`. As a result L^AT_EX’s standard setting for `\bfdefault` didn’t work with such fonts, but if it got changed to produce `b`, then that didn’t work with Computer Modern if the fonts got combined (e.g., using Computer Modern Typewriter with such fonts).

The solution back then was to provide substitution rules in the font .fd such that if a `bx` series got requested the `b` series got used. While this works in that particular case, it isn’t a very general solution. For example, if you happen to have a font family that has several weights you may want to typeset the whole document in a somewhat lighter or darker font but if you then modify `\mddefault` to allow for this, then of course your change only works with that particular family but not with the typewriter or sans serif family you also want to use.

A better solution was provided by the `mweights` package by Bob Tennent that offers defaults on the level of the three main font families in the document: for “rm”, “sf” and “tt” so that font packages could define defaults for the sans serif document font by providing `\bfseries@sf` which then was used when `\bfseries` got executed and the current family was the `\sffamily`.

`\DeclareFontSeriesDefault`

We now support this concept directly from within L^AT_EX and for use in font packages (or the document preamble) we offer `\DeclareFontSeriesDefault`. This declaration takes three arguments:

document family interface: Can either be `rm`, `sf` or `tt`. This is optional and if not given the overall default.

document series interface: Can be `md` or `bf`.

series value: This is the value that is going to be used with the combination is requested.

For example, `\DeclareFontSeriesDefault[rm]{bf}{sb}` would use `sb` (semi-bold) when `\rmfamily\bfseries` is asked for.

If used without the optional argument, e.g., `\DeclareFontSeriesDefault{bf}{b}` then this is like redefining `\bfdefault` or `\mddefault`.

If some family specify defaults aren't given, e.g. if there are no declarations for, say, `tt` then the format defaults of `\mddefault` and `\bfdefault` are assumed. If those are later changed this is *not* reflected!³⁷

`\DeclareFontSeriesDefault` The command to declare font series defaults for the “rm”, “sf” or “tt” family.

```

36  \let\DeclareFontSeriesDefault\@undefined          % for rollback
37  \newcommand\DeclareFontSeriesDefault[3][]{%
38      \expandafter\def
39          \ifcsname #2series\endcsname            % supported are
40          \ifcsname #3series\endcsname           % \[md/bf]default
41          \def\reserved@a{\#1}%

```

No optional argument: set up general default.

```

42  \ifx\reserved@a\@empty
43      \ifcsname #2series\endcsname            % supported are
44          \ifcsname #3series\endcsname           % \[md/bf]default

```

Adding `\@empty` allows us to detect if the default gets redefined with `\renewcommand` or `\def` by the user.

```

45      \expandafter\def
46          \csname #2default\endcsname{\#3\@empty}%
47      \expandafter\def
48          \csname #2default@previous\endcsname{\#3\@empty}%
49  \else
50      \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
51          {Mandatory first argument must be 'md' or 'bf'.}
52  \fi

```

Optional argument given, set up specific default.

```

53  \else
54      \ifcsname #2series@\#1\endcsname          % supported are
55          \ifcsname #3series@\#1\endcsname         % \[md/bf]series@[rm/sf/tt]
56      \expandafter\edef
57          \csname #2series@\#1\endcsname{\#3}%

```

If the interface is used we remove the frozen kernel default. This way, we know that something was explicitly set up (even if the setup has the same value as the default).

```

58      \expandafter\let
59          \csname #2series@\#1@kernel\endcsname\@undefined
60  \else
61      \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
62          {Optional argument must be 'rm', 'sf', or 'tt'. \MessageBreak
63          Mandatory first argument must be 'md' or 'bf'.}
64  \fi
65 \fi
66 }

```

³⁷I see no easy way to achieve this without compromising compatibility with existing packages that currently use `mweights` and directly define (some) of the `\mdseries@..` commands but not others.

(End of definition for \DeclareFontSeriesDefault.)

```

`\mdseries@rm` We initialize the family specific default at the end of the format generation. Later on they may get overwritten in the preamble or a package via `\DeclareFontSeriesDefault` (or possibly directly).

`\bfseries@rm` Conceptual change: The `\bfdefault` will be `b` not `bx` because that is what it should be really for nearly every font except Computer/Latin Modern.

`\bfseries@sf` To account for the fact that by default we typeset in CM or LM we set up the `\bfseries@..` defaults to use `bx` instead.

This means that it behaves like before because if the default fonts are used then `\bfseries@rm` etc kick in and make `\textbf` use `bx`. However, if the font gets changed then `\bfdefault` will get used.

```
129 \def\bfsf@rm{bx}
130 \def\bfsf@sf{bx}
131 \def\bfsf@tt{bx}
```

Frozen version of the kernel defaults so we can see if they have changed.

```
132 \let\bfsf@rm@kernel\bfsf@rm
133 \let\bfsf@sf@kernel\bfsf@sf
134 \let\bfsf@tt@kernel\bfsf@tt
```

The default for the medium series is `m` and this will be interpreted as resetting both weight and width. To reset only one of them the virtual value `?m` and `m?` are available.

```
135 \def\mdseries@rm{m}
136 \def\mdseries@sf{m}
137 \def\mdseries@tt{m}
```

(*End of definition for `\mdseries@rm` and others.*)

`\series@change@debug` For debugging, but right now none of this code is extracted. The idea is to have a separate package with debugging code one day.

```
138 \begin{macro}{*debug}
139 \begin{macro}{\series@change@debug}\typeout
140 \begin{macro}{\series@change@debug}\gobble
141 \begin{macro}{\series@change@debug}
```

(*End of definition for `\series@change@debug`.*)

`\prepare@family@series@update` This is core command that prepares for the family update. The big difference to the documented code above is that the nested `\ifx` statements seem to be missing. Instead we loop through an internal list that holds the names of the three meta families. This approach allows us to extend the mechanism at a later stage to allow for additional named meta families.

Here is the current definition of that list:

```
142 \def\@meta@family@list{\@elt{rm}\@elt{sf}\@elt{tt}}
```

```
143 \def\prepare@family@series@update#1#2{%
```

```
144 \if@forced@series
```

```
145 <+debug> \series@change@debug{No series preparation (forced \f@series)\on@line}%
146 \fontfamily#2%
```

```
147 \else
```

```
148 <+debug> \series@change@debug{Preparing for switching to #1 (#2)\on@line}%
149 \expand@font@defaults
```

We prepare for changing the current series. We have to find it before changing the family as discussed above.

```
150 \let\target@series@value\empty
151 \def\target@meta@family@value{#1}%
```

As the very last item in the meta family list we add `\@elt{??}` and define this pseudo meta family to be the current font family. So if none of the real meta families matched then this will match. This will cover the following case:

- `\bfseries` is called for a family using `bx` (e.g., CMR)
- Switch to a font family that is none of the meta families, e.g., via `\fontfamily{ptm}\allowbreak\verb+\bfseries+`
- Then none of the real meta families, match but the final `\@elt{??}` will.
- Therefore if the current series is `\mddefault` or `\bfdefault` it will be detected and the corresponding target series selected.

```
152 \expandafter\edef\csname ??def@ult\endcsname{\f@family}%
```

To find it we loop over the meta family list with a suitable definition of `\@elt`.

```
153 \let\@elt\update@series@target@value
154 \@meta@family@list
```

Last resort pseudo meta family. Will only be looked at if none of the real ones have matched.

```
155 \@elt{??}%
156 \let\@elt\relax
```

That will figure out the correct series value to use without updating it. Now we can change the family.

```
157 \fontfamily#2%
```

After that we update the series. That code is again like the one above.

```
158 \ifx\target@series@value\empty
159 <+debug> \series@change@debug{Target series still empty ...}%
160 \else
161 \ifx\f@series\target@series@value
162 <+debug> \series@change@debug{Target series unchanged:
163 <+debug> \f@series \space = \target@series@value}%
164 \else
165 \maybe@load@fontshape
166 <+debug> \series@change@debug{Target series:
167 <+debug> \f@series \space -> \target@series@value}%
```

The `\target@series@value` may contain something like `cm` (coming from a default) and so we can't directly assign it to `\f@series` because we have to drop any surplus `m` first.

```

168 %      \let\f@series\target@series@value
169     \series@maybe@drop@one@m\target@series@value\f@series
170     \fi
171     \fi
172     \fi
173 }
```

(End of definition for `\prepare@family@series@update` and `\@meta@family@list`.)

`\update@series@target@value` In this macro used in the loop you basically find the nested `\ifxs` from the outline above. The only difference is that it is parameterized instead of being written out and only for one block of tests because the code is called repeatedly when looping over the meta family list. From the list we get each meta family name in turn.

```
174 \def\update@series@target@value#1{%
```

There is one additional test at the beginning, because the list contains all meta families and we need to ignore the case where current one from the list and target one are identical.

```

175 \def\reserved@a{\#1}%
176 \ifx\target@meta@family@value\reserved@a    % rm -> rm do nothing
177 \else
178 {+debug} \series@change@debug{Trying to match #1: \csname#1\def@ult\endcsname
179 {+debug}                                \space = \f@family\space ?}%

```

We only "do" something if the current font family matches the current meta family.

```
180 \expandafter\ifx\csname#1\def@ult\endcsname\f@family
```

If that's the case we know that this is the block that applies (only one meta family can match). So to speed things up we change `\@elt` so that the rest of the loop gets gobbled.

```
181 \let\@elt\@gobble
```

Then we try to find the right new value for the series (as explained above). The two macros defined first are only there because we now need to use `\csname` and this way the code will be a little faster.

```

182 \expandafter\let\expandafter\reserved@b
183             \csname mdseries@\target@meta@family@value\endcsname
184 \expandafter\let\expandafter\reserved@c
185             \csname bfseries@\target@meta@family@value\endcsname
186 {+debug} \series@change@debug{Targets for mdseries and bfseries:
187 {+debug}                                \reserved@b\space and \reserved@c}%

```

This here is now identical to the nested `\ifx` block from the outline, except that it there appeared twice in `\rmfamily`. This is now covered by looping and stopping the loop when a match was found.

We have to sanitize the default value first because it may contain something like `mc` and that would never match `\f@series` because there it would be called `c` with the `m` dropped. It would be probably better to do that differently these days, but it is hard to adjust without causing a lot of issues, so we do the dropping in various places instead.

```

188 \expandafter\series@maybe@drop@one@m
189             \csname mdseries@#1\endcsname\reserved@d
190 \ifx\reserved@d\f@series
191 {+debug}   \series@change@debug{mdseries@#1 matched -> \reserved@b}%
192                                         \let\target@series@value\reserved@b
193 \else

```

Again do some sanitizing.

```
194     \expandafter\series@maybe@drop@one@m
195         \csname bfseries@#1\endcsname\reserved@d
196     \ifx\reserved@d\f@series
197 {+debug} \series@change@debug{bfseries@#1 matched -> \reserved@c}%
198             \let\target@series@value\reserved@c
199     \else\ifx\f@series\mddef@ult \let\target@series@value\reserved@b
200 {+debug} \series@change@debug{mddef@ult matched -> \reserved@b}%
201             \else\ifx\f@series\bfdef@ult \let\target@series@value\reserved@c
202 {+debug} \series@change@debug{bfdef@ult matched -> \reserved@c}%
203             \fi\fi\fi\fi
204     \fi
205 \fi
206 }
```

(End of definition for \update@series@target@value.)

\init@series@setup This is code to be run at begin document ...

```
207 \def\init@series@setup{%
```

We only want **bx** in \bfseries@rm if the roman font is Computer Modern or Latin Modern, otherwise it should be **b**. It was set to **bx** in the kernel so that any font use with the default families in the preamble get this value. Now at the real document start we check if the fonts have been changed. If there was a \DeclareFontSeriesDefault declaration or \bfseries@rm was directly altered then it differs from \bfseries@rm@kernel and we do nothing. Otherwise we check if \rmdefault is one of the CM/LM font families and if so we keep **bx** otherwise we change it to **b**.

This approach doesn't cover one case: CM/LM got changed to a different family that supports **bx**, but the support package for that family used \def\bfseries@rm{bx} instead of using \DeclareFontSeriesDefault. In that case the code here changes it to **b**. Solution: use the \DeclareFontSeriesDefault interface.

```
208 \ifx\bfseries@rm@kernel\bfseries@rm
209     \expandafter\in@\expandafter{\rmdefault}%
210         {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmmt}%
211     \ifin@ \else \def\bfseries@rm{b}\fi\fi
```

Same approach for \bfseries@sf and \bfseries@tt:

```
212 \ifx\bfseries@sf@kernel\bfseries@sf
213     \expandafter\in@\expandafter{\sfdefault}%
214         {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmmt}%
215     \ifin@ \else \def\bfseries@sf{b}\fi\fi
216 \ifx\bfseries@tt@kernel\bfseries@tt
217     \expandafter\in@\expandafter{\ttdefault}%
218         {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmmt}%
219     \ifin@ \else \def\bfseries@tt{b}\fi\fi
```

If the document preamble has changed the \familydefault or if the if the \rmdefault contains a new font family, we may have to adjust the series defaults accordingly, before starting typesetting.

Similarly, if the user has changed the \mddefault or the medium series for the family selected as document font we may also have to adjust the \seriesdefault.

On the other hand if the document font is still CM or LM then \bfdefault is wrong, because it is now saying **b** and not **bx** as it should for such fonts.

To fix all this we first run `\reset@font` (the internal kernel name for `\normalfont`). This will set up the document encoding, family, series and shape based on the current values of `\encodingdefault`, `\familydefault`, `\seriesdefault` and `\shapedefault`. However, if the family (from `\familydefault`) has special medium default we should switch to that (and not use what is current value from `\seriesdefault`). This can be achieved by afterwards calling `\mediumseries` and then changing `\seriesdefault` to the now current series value (in `\f@series`).

But what should happen if `\seriesdefault` got explicitly changed? In that case the explicit change should survive and we should not alter `\seriesdefault`. This is solved by comparing the current value of `\seriesdefault` with a kernel version saved in the format and if they differ we do not call `\mdseries` or change `\seriesdefault`.

```

220  \reset@font
221  \ifx\seriesdefault\seriesdefault@kernel
222    \mdseries
223    \let\seriesdefault\f@series
224  \fi
225 }%
```

(End of definition for `\init@series@setup`.)

As the kernel code now implements the same functionality as `mweights`, albeit internally coded slightly differently, that package shouldn't be loaded any more. We therefore pretend that it already got loaded. Thus, a font package that tries to load it and then sets `\mdseries@...`, etc. will continue to work but will now use the kernel code.

Of course, mid-term such package should probably use `\DeclareFontSeriesDefault` instead of making using low-level definitions.

```

\bfseries This document command switches to the bold series.

```

255 \DeclareRobustCommand\bfseries{%
256   \not@math@alphabet\bfseries\mathbf

```

In the original NFSS definition it then called \fontseries with the value \bfdefault. In the new scheme we have more alternatives and therefore check if the current family ($\f@family$) is the current \rmdef@ult, \sfdef@ult or \ttdef@ult and the select the correct family default in that case.

```

257  \expand@font@defaults
258  \maybe@update@bfseries@defaults
259  \ifx\f@family\rmdef@ult    \fontseries\bfseries@rm
260  \else\ifx\f@family\sfdef@ult \fontseries\bfseries@sf
261  \else\ifx\f@family\ttdef@ult \fontseries\bfseries@tt

```

If not \bfdefault is used.

```

262  \else                      \fontseries\bfdefault
263  \fi\fi\fi

```

This hook in contrast is always executed.

```

264  \UseHook{bfseries}%
265  \selectfont
266 }

```

(End of definition for \bfseries.)

\maybe@update@bfseries@defaults If \bfdefault and \bfdefault@previous are different then the default got changed directly through the legacy interface (i.e., via \def or \renewcommand). In that case we reset all meta family defaults so that the document behaves like it was the case before the new mechanism was introduced.

```

267 \def\maybe@update@bfseries@defaults{%
268   \ifx\bfdefault\bfdefault@previous\else

```

We add \@empty and then let \bfdefault@previous to \bfdefault so that we can detect any further change.

```

269  \expandafter\def\expandafter\bfdefault
270  \expandafter{\bfdefault\@empty}%
271  \let\bfdefault@previous\bfdefault

```

And we reset the meta family defaults (\bfdef@ult is an expanded version of \bfdefault).

```

272  \let\bfseries@rm\bfdef@ult
273  \let\bfseries@sf\bfdef@ult
274  \let\bfseries@tt\bfdef@ult

```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add resets here. Note that this hook is only run when resets are necessary.

```

275  \UseHook{bfseries/defaults}%
276  \fi
277 }

```

(End of definition for \maybe@update@bfseries@defaults.)

\mdseries This document command switches to the medium series.

```
278 \DeclareRobustCommand\mdseries{%

```

`\expand@font@defaults` The family specific defaults are fully expanded, i.e., they are defined via `\edef` inside `\DeclareFontSeriesDefault`. However, the overall defaults, e.g., `\bfdefault` may have been redefined by the user and thus may not be fully expanded. So to enable reliable comparison we make expanded versions of them. That we rerun each time. The alternative would be to only allow for changes before begin document.

`\bf@def@ult`

```

398 \def\expand@font@defaults{%
399   \edef\rmdef@ult{\rmdefault}%
400   \edef\sfdef@ult{\sfdefault}%
401   \edef\ttdef@ult{\ttdefault}%

```

The series defaults may contain some surplus `m` that we need to drop here.

```

402 \series@maybe@drop@one@m\bfdefault\bfdef@ult
403 \series@maybe@drop@one@m\mddefault\mddef@ult

```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add additional code here.

```

404 \UseHook{\expand@font@defaults}%
405 }

```

(End of definition for `\expand@font@defaults` and others.)

`\rmfamily` Here are the document level commands for changing the main font families, or rather, here is a documented outline of the code, the actual code is then streamlined and somewhat generalized.

```

\rmfamily\rmfamily{%
\not@math@alphabet\rmfamily\mathrm

```

If families are changed then we have to do a bit more work. In the original NFSS implementation a family change kept encoding, series shape and size unchanged but now we can't any longer simply reuse the current series value. Instead we may have to change it from one family default to the next.

```
\expand@font@defaults
```

We have to do the testing while the current family is still unchanged but we have to do the adjustment of the series after it got changed (because the new family might have different sets of shapes available and we certainly don't want to see substitution going on. So we use `\target@series@value` to hold the target series (if any).

```
\let\target@series@value\empty
```

Thus, if the current family is the sans family

```
\ifx\f@family\sfdef@ult
```

and if we using the medium series of the sans family

```
\ifx\f@series\mdseries@sf
```

then lets switch to the medium series for the serif family

```
\let\target@series@value\mdseries@rm
```

and if we use the bold series of the sans family switch to the bold default of the serif family:

```
\else\ifx\f@series\bfseries@sf \let\target@series@value\bfseries@rm
```

However, the sans family may not have any specific defaults set, so we also compare with the overall defaults.

```
\else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm  
\else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm
```

If neither test was true we leave the series alone. This way a special manual setting such as `\fontseries{lc}` is not undone if the family changes (of course there may not be any support for it in the new family but then the NFSS substitution kicks in and sorts it out).

```
\fi\fi\fi\fi
```

We need to do the same if the current family is the typewriter family:

```
\else\ifx\f@family\ttdef@ult  
  \ifx\f@series\mdseries@tt \let\target@series@value\mdseries@rm  
  \else\ifx\f@series\bfseries@tt \let\target@series@value\bfseries@rm  
  \else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm  
  \else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm  
    \fi\fi\fi\fi  
\fi\fi
```

With these preparations for series out of the way we can now change the font family to `\rmdefault`.

```
\fontfamily\rmdefault
```

If `\target@series@value` is still empty there is nothing more to do other than selecting the new family. However, if not then we should update the font series now as well. But there is one further subtle issue. We may not have loaded an `.fd` file for our target font family yet. In the past that was done in `\selectfont` if necessary but since we are now doing all the comparisons in `\fontseries` we need to make sure that the font family specifications are already loaded prior to calling `\fontseries`.

```
\ifx\target@series@value\empty \else
  \maybe@load@fontshape
```

Updating the series in this case means directly changing `\f@series` to the target value. We don't want to go through `\fontseries` because that would apply the mappings and then `bx + b` would keep `bx` instead of changing to `b` as desired. as

```
\let\f@series\target@series@value
\fi
\selectfont}
```

So now for the real definition: most of the code above gets delegated to a helper command `\prepare@family@series@update` so that the definition becomes again fairly short. In addition we add a hook, mainly for our Japanese friends so that the code can be extended prior to the call to `\selectfont`.

```
406 \DeclareRobustCommand\rmfamily{%
 407   \not@math@alphabet\rmfamily\mathrm
```

This holds all the code discussed above, first argument is the meta family, i.e., `rm` in this case, and second argument is the default family name, e.g., `cmr` indirectly accessed via `\rmdefault`. This is calling `\fontfamily` and if necessary `\fontseries` as outline above.

```
408   \prepare@family@series@update{rm}\rmdefault
```

Then comes the hook code (by default a no-op) and finally the call to `\selectfont`.

```
409   \UseHook{rmfamily}%
 410   \selectfont
```

The definitions for `\sffamily` and `\ttfamily` are similar, the differences are only in what font families get checked.

```
\ttfamily 411 \DeclareRobustCommand\sffamily{%
 412   \not@math@alphabet\sffamily\mathsf
 413   \prepare@family@series@update{sf}\sfdefault
 414   \UseHook{sffamily}%
 415   \selectfont

 416 \DeclareRobustCommand\ttfamily{%
 417   \not@math@alphabet\ttfamily\mathtt
 418   \prepare@family@series@update{tt}\ttdefault
 419   \UseHook{ttfamily}%
 420   \selectfont}
```

(End of definition for `\rmfamily`, `\sffamily`, and `\ttfamily`.)

```
rmfamily    Declare the hooks used above.  
sffamily    421 \NewHook{rmfamily}  
ttfamily    422 \NewHook{sffamily}  
normalfont  423 \NewHook{ttfamily}  
expand@font@defaults 424 \NewHook{normalfont}  
bfseries    425 \NewHook{expand@font@defaults}  
bfseries/defaults 426 \NewHook{bfseries}  
mdseries    427 \NewHook{bfseries/defaults}  
mdseries/defaults 428 \NewHook{mdseries}  
429 \NewHook{mdseries/defaults}
```

(End of definition for `rmfamily` and others.)

`\@rmfamilyhook` These four hooks have legacy versions used in 2020/02/02 so we should support them
`\@sffamilyhook` until they aren't any longer used.

By default the hooks do nothing.

```
\@defaultfamilyhook 430 \let\@rmfamilyhook\@empty
                     431 \let\@sffamilyhook\@empty
                     432 \let\@ttfamilyhook\@empty
                     433 \let\@defaultfamilyhook\@empty %FMi sort out
```

(End of definition for \@rmfamilyhook and others.)

```

\IfFontSeriesContextTF With the ability for `\bfseries` or `\mdseries` to be mapped to different NFSS axis values it becomes important to have the ability to determine the current context as we can no longer look at `\f@series` to answer a question such as “am I currently typesetting in a bold typeface?”

This is provided by the test `\IfFontSeriesContextTF`. It takes three arguments:

- The context we try to check (either `bf` for bold or `md` for medium, i.e., the same that can go into the first mandatory argument of `\DeclareFontSeriesDefault`),
- what to do if we are in this context (true case) and
- what to do if we are not (false case).

This allows you to define commands like `\IfBold`, e.g.,

```
\NewDocumentCommand\IfBold{mm}{\IfFontSeriesContextTF{bf}{#1}{#2}}
```

and then do

```
This is \IfBold{bold}{non-bold} text.
```

and get the appropriate result.

```
497  </2ekernel>
498  <*2ekernel | latexrelease>
499  <latexrelease>\IncludeInRelease{2020/10/01}%
500  <latexrelease>          {\IfFontSeriesContextTF}{Font series context}%
501  \DeclareRobustCommand\IfFontSeriesContextTF[1]{%
502    \expand@font@defaults
```

In the beginning we haven't found the context we are looking for.

```
503  \@font@series@contextfalse
```

We store the requested context away for use in the tests.

```
504  \def\requested@test@context{\#1}%
```

The next definition is there to ensure that get a final match during testing even if the current family is non of the meta families (`rm`, `sf` or `tt`). This will then basically tests if the current font family matches the overall default.

```
505  \expandafter\edef\csname ??def@ult\endcsname{\f@family}%
```

Then we run through the meta family list (currently containing just the three values) followed by the artificial meta family `??` and test each of them in turn using `\test@font@series@context` as the testing command.

```
506  \let\@elt\test@font@series@context
507  \cmeta@family@list
508  \@elt{??}%
509  \let\@elt\relax
```

Following that we evaluate the status of `\if@font@series@context` to determine which of the remaining arguments (true/false case) we have to execute.

```
510  \if@font@series@context
511  \expandafter\@firstoftwo
512  \else
513  \expandafter\@secondoftwo
514  \fi
515 }
```

(End of definition for `\IfFontSeriesContextTF`.)

`\test@font@series@context` This tests the context (stored in `\requested@test@context`) and updates the boolean if the right context is found.

```
516 \def\test@font@series@context#1{%
```

First task is to figure out whether the current family matches `\rmfamily`, `\sffamily`, etc. so in `\reserved@a` we store the value of `\rmdef@ult` (or whatever the given meta family is) and compare that to `\f@family`.

```
517 \edef\reserved@a{\csname #1def@ult\endcsname}%
518 \ifx\f@family\reserved@a
```

If they match we have found the right meta family so we don't need to test any of the remaining meta family and therefore change `\@elt` to `\@gobble`.

```
519 \let\@elt\@gobble
```

Now we have to test if `\f@series` matches the requested context (e.g., whether `\bfseries@rm` has that value if the current meta family is `rm` and we are looking for the `bf` context).

```
520     \expandafter\ifx
521             \csname\requested@test@context series@\#1\endcsname\f@series
```

If yes we change the boolean and are done.

```
522     \font@series@contexttrue
```

If not then maybe the reason is that nothing special was set up for that meta family so we also check now if `\f@series` matches the overall default (e.g., `\bfdef@ult` if we are looking for the bold context). If that matches we change the boolean.

```
523     \else
524         \expandafter\ifx
525             \csname\requested@test@context def@ult\endcsname\f@series
526         \font@series@contexttrue
527     \fi\fi\fi
528 }
```

(End of definition for `\test@font@series@context`.)

`\if@font@series@context` The boolean to signal if we found the requested font series context.

```
529 \newif\if@font@series@context
```

(End of definition for `\if@font@series@context`.)

```
530 </2ekernel | latexrelease>
531 <latexrelease>\EndIncludeInRelease
532 <latexrelease>\IncludeInRelease{0000/00/00}%

```

3 Supporting nested emphasis

By default L^AT_EX 2 _{ε} supports two levels of nested emphasis: if the current font has an upright shape then it switches to `\itshape` otherwise to `\emnnershape` (which defaults to `\upshape`). This means nested emphasis will oscillate between italic and upright shapes.

Sometimes it would be nice to allow for a more lengthy sequence, but instead of providing a fixed one L^AT_EX now offers a general mechanism that allows to define arbitrary sequences.

```
\DeclareEmphSequence
\emforce
```

This declaration expects a comma separated list of (font) change declarations corresponding to increasing levels of emphasis. The mechanism tries to be “smart” and verifies that the declarations actually alter the font. If not it will ignore this level and tries the next one—the assumption being that there was a manual font change in the document

to the font that is now supposed to be used for emphasis. Of course, this only works if the declarations in the list actually change the font and not, say, just the color. In such a case one has to use `\emforce` to which directs the mechanism to use the level even if the font attributes haven't changed.

`\emreset` If the nesting is so deep, that the specified levels are exhausted then `\emreset` is used as a final set of declarations (which by default returns back to the upright shape). Any additional nesting levels will then reuse the list from its beginning.

`\DeclareEmphSequence` `\DeclareEmphSequence` expects aclist of declaration. Spaces in the argument are dropped to avoid spurious spaces in the output. The declarations are additive. At the very end the shape is reset using `\emreset` and `\emforce` so that this case is never skipped.³⁸ Further nested calls restart at the beginning.

```

545  <latexrelease>           {\DeclareEmphSequence}{Nested emph}%
546  \def\DeclareEmphSequence#1{%
547    \protected@edef\emfontdeclare@clist{\zap@space#1, \empty\emforce\emreset}%
548  }

```

By default the it is empty, in which case `\eminnershape` is used by L^AT_EX.

```
549 \let\emfontdeclare@clist\empty
```

(End of definition for `\DeclareEmphSequence`.)

`\emrest` Reset the font to upright and upper/lower case. With the default rules using `\shapedefault` does that for us but to be on the safe side we do it like this:

```
550 \DeclareRobustCommand\emrest{\upshape\ulcshape}
```

(End of definition for `\emrest`.)

`\em` The new definition for `\em` (and implicitly `\emph`) is the same as before as long as `\emfontdeclare@clist` is empty.

```

551 \DeclareRobustCommand\em{%
552   \nomath\em
553   \ifx\emfontdeclare@clist\empty
554     \ifdim \fontdimen1ne\font >\z@
555       \eminnershape \else \itshape \fi
556   \else

```

But if not we use the list to decide how to do emphasis.

We use the current font to check if the declarations have any effect, so even a size change is allowed and identified as a modification (but a color change, for example, isn't). So first we save the current status.

```
557 \edef\em@currfont{\csname curr@fontshape/\f@size\endcsname}%
```

Then we grab the next element from the list and check if it can be used.

```

558   \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
559   \fi
560 }
```

³⁸ Maybe we should not add `\emforce` but allow that case to be skipped as well. Of course, that might result in an endless loop if somebody defines a sequence without any font change and without `\emforce` but ...

```
561 \def\eminnershape{\upshape}
```

(End of definition for \em.)

\do@emfont@update We know that the list (if not empty) has at least 2 elements separated by a comma, so we pick up the first in #1 and the rest in #2.

```
562 \def\do@emfont@update#1,#2\do@emfont@update{%
```

First action is to alter the list and move the first entry to the end

```
563 \def\emfontdeclare@clist{-#2,#1}%
```

Then we execute the current declaration. Appending \selectfont means one can write just \fontshape{it} and that works then too.

```
564 % \typeout{Use: \detokenize{#1}}%
```

```
565 #1\selectfont
```

We then compare the current font with our saved version, but with a slight twist: we add \em@force at the end of the name. Normally this is empty so has no effect but if there was an \emforce as part of #1 it will append a / to the font name (making it invalid) thus this will then always fail the test.

If the test fails we are done and the declarations will be used. Otherwise we will try the next declaration in the sequence.

```
566 \expandafter\ifx\csname \curr@fontshape/\f@size\em@force
```

For the comparison with \ifx we have to expand \em@currfont once as the relevant info is inside.

```
567 \expandafter\endcsname  
568 \em@currfont  
569 \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
```

If \emforce was used, we have to undo its effect:

```
570 \else  
571 \let\em@force\@empty  
572 \fi  
573 }
```

(End of definition for \do@emfont@update.)

\emforce The definition of \emforce is simple: change \em@force to make the above test always invalid.

```
574 \protected\def\emforce{\def\em@force{/}}  
575 \let\em@force\@empty  
576 </2ekernel | latexrelease>  
577 <latexrelease>\EndIncludeInRelease
```

(End of definition for \emforce and \em@force.)

\em \eminnershape These are the older definitions for \em, prior to 2020.

We also have to define the *emphasize* font change command (i.e. \em). This command will look is the current font is sloped (i.e. has a positive \fontdimen1) and will then select either \upshape or \itshape.

```
578 <latexrelease>\IncludeInRelease[2015/01/01]{\DeclareEmphSequence}{Nested emph}-%  
579 <latexrelease>\let\DeclareEmphSequence\@undefined  
580 <latexrelease>\let\emfontdeclare@clist\@undefined  
581 <latexrelease>\let\emreset\@undefined  
582 <latexrelease>\let\do@emfont@update\@undefined
```

```

583 〈\latexrelease〉\let\emforce\@undefined
584 〈\latexrelease〉\let\em@force\@undefined

595 〈\latexrelease〉\let\eminnershape\@undefined
596 〈\latexrelease〉\EndIncludeInRelease
597 〈*2ekernel〉

```

(End of definition for `\em` and `\eminnershape`.)

`\not@math@alphabet` This function generates an error message when it is called in math mode. The same function should be defined in `newfont.sty`.

```

598 \def\not@math@alphabet#1#2{%
599   \relax
600   \ifmmode
601     \@latex@error{Command \noexpand#1 invalid in math mode}%
602     {%
603       Please
604       \ifx#2\relax
605         define a new math alphabet^{#1}%
606         if you want to use a special font in math mode%
607       \else
608         use the math alphabet \noexpand#2 instead of
609         the #1 command%
610       \fi
611       .
612     }%
613   \fi}

```

We have to a `\noexpand` below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there :-).

```

608       use the math alphabet \noexpand#2 instead of
609       the #1 command%
610     \fi
611     .
612   }%
613 \fi}

```

(End of definition for `\not@math@alphabet`.)

Finally we provide two abbreviations to switch to the L^AT_EX versions.

```

614 \DeclareRobustCommand\boldmath{\@nomath\boldmath
615   \mathversion{bold}}
616 \DeclareRobustCommand\unboldmath{\@nomath\unboldmath
617   \mathversion{normal}}

```

Here we switch to the default math version by defining the internal macro `\math@version`. We dare not to call `\mathversion` at this place because this would call `\gls@settings`.

```

618 \def\math@version{normal}

```

3.1 Legacy

We start by defining a few macros that are part of standard L^AT_EX's user interface. The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

```
\newfont  
619 \def\newfont#1#2{\@ifdefinable#1{\font#1=#2\relax}}  
(End of definition for \newfont.)  
  
\symbol  
620 </2ekernel>  
621 <*2ekernel | latexrelease>  
622 <latexrelease>\IncludeInRelease{2020/10/01}%  
623 <latexrelease> {\symbol}{XeTeX change for math}%  
624 \ifdefined\XeTeXversion  
625 \ DeclareRobustCommand\symbol[1]{\Ucharcat#1 12\relax}  
626 \else  
627 \ DeclareRobustCommand\symbol[1]{\char#1\relax}  
628 \fi  
629 </2ekernel | latexrelease>  
630 <|latexrelease>\EndIncludeInRelease  
631 <|latexrelease>\IncludeInRelease{0000/00/00}%  
632 <|latexrelease> {\symbol}{XeTeX change for math}%  
633 <|latexrelease>  
634 <|latexrelease>\DeclareRobustCommand\symbol[1]{\char#1\relax}  
635 <|latexrelease>  
636 <|latexrelease>\EndIncludeInRelease  
637 <*2ekernel>  
(End of definition for \symbol.)
```

3.2 Miscellaneous

\@setfontsize This abbreviation is used by L^AT_EX's user level size changing commands, such as \large.
\@setsizesize 638 \def\@setfontsize#1#2#3{\@nomath#1%

For the benefit of people relying on keeping the name of the current font command saved in \@currsize we define it. To ensure that \@setfontsize keeps being robust we omit this assignment during times where \protect differs from \typeset@protect.

```
639 \ifx\protect\@typeset@protect  
640 \let\@currsize#1%  
641 \fi  
642 \fontsize{#2}{#3}\selectfont
```

For compatibility we also define \@setsizesize the 209 command

```
643 <*compat>  
644 \def\@setsizesize#1#2#3#4{\@setfontsize#1{#4}{#2}}  
645 </compat>
```

(End of definition for \@setfontsize and \@setsizesize.)

\hexnumber@ To set up L^AT_EX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple \ifcase.

```
646 \def\hexnumber@#1{\ifcase\number#1  
647 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or  
648 9\or A\or B\or C\or D\or E\or F\fi}
```

(End of definition for \hexnumber@.)

\nfss@text In its simplest form \nfss@text is an \mbox. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the **amstex** style option one will get a sub style called **amstext** which will redefine the \nfss@text macro to produce correct text in all sizes.

We have to use \def instead of the shorter \let since \mbox is undefined when we reach this point.

```
649 \def\nfss@text#1{{\mbox{#1}}}
```

(End of definition for \nfss@text.)

\copyright The definition of \copyright was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in ltoutenc.dtx.

```
650 %\DeclareRobustCommand\copyright  
651 % {\oalign{\hfil  
652 % \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr  
653 % \mathhexbox20D}}
```

(End of definition for \copyright.)

\normalfont \reset@font The macro \reset@font is used in L^AT_EX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L^AT_EX version above but nevertheless are able to run all kind of mixtures.

The user interface name for \reset@font is \normalfont:

```
654 /2ekernel  
655 {*2ekernel | latexrelease}  
656 <latexrelease>\IncludeInRelease{2021/06/01}%  
657 <latexrelease> {\normalfont}{Add hook to \normalfont}%  
658 \DeclareRobustCommand\normalfont{%
```

Instead of calling \usefont, as it was done in the past, we inline the code from \usefont as we want to add the hook before \selectfont, but after all the font attributes are set.

```
659 \fontencoding\encodingdefault  
660 \edef\f@family{\familydefault}%  
661 \edef\f@series{\seriesdefault}%  
662 \edef\f@shape{\shapedefault}%
```

Any earlier \fontseries, etc. should be canceled and we should switch unconditionally to the requested font face so we drop any code that may have been stored in \delayed@f@adjustment.

```
663 \let\delayed@f@adjustment\empty  
664 \UseHook{normalfont}%
```

This is the old name for the hook introduced in 2020/02/02. It will be removed in one of the future releases!

```
665     \@defaultfamilyhook          % hookname from 2020/02 will vanish
666     \selectfont}
667 \let\reset@font\normalfont
(End of definition for \normalfont and \reset@font.)

668 % \changes{v3.2g}{2021/03/18}
669 %           {Add missing 2020/02/02 latexrelease entry.}
670 </2ekernel | latexrelease>
671 <latexrelease>\EndIncludeInRelease
672 <latexrelease>
673 <latexrelease>\IncludeInRelease{2020/10/01}%
674 <latexrelease>                  {\normalfont}{Add hook to \normalfont}%
675 <latexrelease>

694 <latexrelease>  \edef\f@family{\familydefault}%
695 <latexrelease>  \edef\f@series{\seriesdefault}%
696 <latexrelease>  \edef\f@shape{\shapedefault}%
697 <latexrelease>  \@defaultfamilyhook
698 <latexrelease>  \selectfont}
699 <latexrelease>
700 <latexrelease>\let\reset@font\normalfont
701 <latexrelease>
702 <latexrelease>\let\@defaultfamilyhook\empty
703 <latexrelease>
704 <latexrelease>\EndIncludeInRelease
705 <latexrelease>
706 <latexrelease>\IncludeInRelease{0000/00/00}%
707 <latexrelease>                  {\normalfont}{Add hook to \normalfont}%
708 <latexrelease>
709 <latexrelease>\DeclareRobustCommand\normalfont
710 <latexrelease>  {\usefont\encodingdefault
711 <latexrelease>    \familydefault
712 <latexrelease>    \seriesdefault
713 <latexrelease>    \shapedefault
```

```

714  \relax}
715  \let\reset@font\normalfont
716  \let\@defaultfamilyhook\undefined
717  \EndIncludeInRelease
718  \EndIncludeInRelease
719  \EndIncludeInRelease
720  {*2ekernel}

```

We left out the special L^AT_EX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```

721  \def\not@base#1{\@latex@error
722    {Command \noexpand#1 not provided in base LATEX2e}%
723    {Load the latexsym or the amsfonts package to
724     define this symbol}}
725  \def\mho{\not@base\mho}
726  \def\Join{\not@base\Join}
727  \def\Box{\not@base\Box}
728  \def\Diamond{\not@base\Diamond}
729  \def\leadsto{\not@base\leadsto}
730  \def\sqsubset{\not@base\sqsubset}
731  \def\sqsupset{\not@base\sqsupset}
732  \def\lhd{\not@base\lhd}
733  \def\unlhd{\not@base\unlhd}
734  \def\rhd{\not@base\rhd}
735  \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```

736 \DeclareErrorFont{OT1}{cmr}{m}{n}{10} %% don't modify this setting
737                                     %% overwrite it in fontdef.cfg
738                                     %% if necessary

```

We also set some default values for `\f@family` etc. Note that we don't yet have any encodings that comes later. In the past this was implicitly done by `\DeclareErrorFont`.

```

739 \fontfamily{cmr}

```

Previously the default values for series and shape were set by calling `\fontseries` and `\fontshape`, but their action is now delayed until `\selectfont` which isn't called inside the format (to avoid unnecessarily loading a font that may never get used). We therefore have to set `\f@series` and `\f@shape` directly instead.

```

740 \def\f@series{m}          % \fontseries{m}
741 \def\f@shape{n}           % \fontshape{n}
742 \fontsize{10}{10}

```

The initial `fontenc` package load list. This will get overwritten in `fonttext` and is only provided in case an old `fonttext.cfg` does not define the command:

```

743 \def@\fontenc@load@list{\@elt{T1,OT1}}

```

We now load the customizable parts of NFSS.

```
744 \InputIfFileExists{fonttext.cfg}
745   {\typeout{=====
746     ^^^J%
747     Local config file fonttext.cfg used^ ^^J%
748     ^^^J%
749     =====}%
750   \def\@addtolist##1{\xdef\@filelist{\@filelist,##1}}%
751   }
752   {\input{fonttext.ltx}}
753 \let\@addtolist\@gobble
Ditto for math although I don't think that we will get a lot of customisation :-)
754 \InputIfFileExists{fontmath.cfg}
755   {\typeout{=====
756     ^^^J%
757     Local config file fontmath.cfg used^ ^^J%
758     ^^^J%
759     =====}%
760   \def\@addtolist##1{\xdef\@filelist{\@filelist,##1}}%
761   }
762   {\input{fontmath.ltx}}
763 \let\@addtolist\@gobble
```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file `preload.ltx`.

```
764 \InputIfFileExists{preload.cfg}
765   {\typeout{=====
766     ^^^J%
767     Local config file preload.cfg used^ ^^J%
768     ^^^J%
769     =====}%
770   \def\@addtolist##1{\xdef\@filelist{\@filelist,##1}}%
771   }
772   {\input{preload.ltx}}
773 \let\@addtolist\@gobble
```

\seriesdefault After `\seriesdefault` got defined inside `fonttext.ltx` or a `.cfg` file overwriting it, we alter its value by appending `\empty` to it. This will vanish if expanded but allows us to check if the default gets altered (even to the same value) in the document preamble. All we have to do is to save the current value somewhere and later compare the two. For this we use `\seriesdefault@kernel`.

```
774 \expandafter\def\expandafter\seriesdefault\expandafter{\seriesdefault\empty}
775 \let\seriesdefault@kernel\seriesdefault
```

(End of definition for `\seriesdefault` and `\seriesdefault@kernel`.)

\@acci We also save the values of some accents in `\@acci`, `\@accii` and `\@acciii` so they can
\@accii be restored by a `minipage` inside a `tabbing` environment.
\@acciii

```
776 \let\@acci\` \let\@accii\` \let\@acciii\=
```

(End of definition for `\@acci`, `\@accii`, and `\@acciii`.)

\cal Here were the two old `<alphabet identifiers>`.
\mit

(End of definition for \cal and \mit.)

777 ⟨/2ekernel⟩

File 30

fontdef.dtx

1 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

2 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If L^AT_EX 2 _{ε} finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised L^AT_EX versions. Thus, before sending in a bug report please try your test file with a L^AT_EX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all L^AT_EX installations behave in the same way.

T1	Cork T _E X text encoding
OT1	old T _E X text encoding
U	unknown encoding
OML	old T _E X math letters encoding
OMS	old T _E X math symbols encoding
OMX	old T _E X math extension symbols encoding
TU	Unicode

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the \TeX user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official \TeX text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all \LaTeX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

3 The `docstrip` modules

The following modules are used to direct `docstrip` in generating external files:

driver	produce a documentation driver file
text	produce the file <code>fonttext.ltx</code>
math	produce the file <code>fontmath.ltx</code>
cfgtext	produce a dummy <code>fonttext.cfg</code> file
cfgmath	produce a dummy <code>fontmath.cfg</code> file

A typical `docstrip` command file would then have entries like:

```
generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}
```

4 A driver for this document

The next bit of code contains the documentation driver file for \TeX , i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the `DOCSTRIP` program.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
4 \begin{document}
5   \DocInput{fontdef.dtx}
6 \end{document}
7 
```

5 The `fonttext.ltx` file

The identification is done earlier on with a `\ProvidesFile` declaration.

```
8 <*text>
9 \typeout{== Don't modify this file, use a .cfg file instead ==^J}
```

5.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `loutenc.dtx`.

By convention, text encoding specific declarations, including the `\DeclareFontEncoding` declaration, are kept in separate file of the form `<enc>enc.def`, e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```
10 \input {omlenc.def}
11 \input {omsenc.def}
```

Documents containing a lot of accented characters should really be using T1 fonts. We therefore load this after OT1 so that T1 encoding specific commands are executed as fast as possible (encoding files are no longer reloaded in `fontenc`).

```
12 \input {ot1enc.def}
13 \input {t1enc.def}
14 \input {ts1enc.def}
15 \ifx\Umathcode\@undefined
```

We then set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```
16 \fontencoding{OT1}
```

The initial `fontenc` package load list if an 8-bit TeX engine is used:

```
17 \def\@fontenc@load@list{\@elt{T1,OT1}}
18 \def\rmsubstdefault{cmr}
19 \def\sfsubstdefault{cmss}
20 \def\ttsubstdefault{cmtt}
21 \LoadFontDefinitionFile{TS1}{cmr}
22 \else
```

Unicode.

```
23 \input {tuenc.def}
24 \fontencoding{TU}
```

The initial `fontenc` package load list if a Unicode engine is used:

```
25 \def\@fontenc@load@list{\@elt{TU}}
26 \DeclareFontSubstitution{TU}{lmr}{m}{n}
27 \LoadFontDefinitionFile{TU}{lmr}
28 \LoadFontDefinitionFile{TU}{lmss}
29 \LoadFontDefinitionFile{TU}{lmtt}
30 \def\rmsubstdefault{lmr}
31 \def\sfsubstdefault{lmss}
32 \def\ttsubstdefault{lmitt}
33 \LoadFontDefinitionFile{TS1}{lmr}
```

```
34 \DeclareFontSubstitution{TU}{lmr}{m}{n}
```

End of Unicode branch.

```
35 \fi
```

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

```
36 \DeclareFontEncodingDefaults{}{}
```

The default font substitution for an encoding is defined in the corresponding `...enc.def` file so for OT1, T1, and TS1 this is already defined.

```
37 \% \DeclareFontSubstitution{T1}{cmr}{m}{n}
```

```
38 \% \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

```
39 \% \DeclareFontSubstitution{TS1}{cmr}{m}{n}
```

This release of L^AT_EX 2 _{ε} assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

For every encoding declaration, L^AT_EX 2 _{ε} will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered. L^AT_EX 2 _{ε} will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the corresponding `.fd` files now. If we don't do this they would be loaded at verification time (i.e. at `\begin{document}`) which would delay processing unnecessarily.

Warning: Please note that this means that you have to regenerate the format whenever you change any of these `.fd` files since L^AT_EX 2 _{ε} will not read `.fd` files if it already knows about the encoding/family combination.

The `\nfss@catcodes` ensures that white space is ignored in any definitions made in the `fd` files.

```
40 \begingroup
41 \nfss@catcodes
42 \input {t1cmr.fd}
43 \input {ot1cmr.fd}

44 \input {ts1cmr.fd}
45 \endgroup
```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading `.fd` files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every T_EX installation, while the amount of main memory is not a limiting factor at most installations.)

```
46 \begingroup
47 \nfss@catcodes
48 \input {t1cmss.fd}
```

```

49 \input {t1cmtt.fd}
50 \input {ot1cmss.fd}
51 \input {ot1cmtt.fd}

52 \input {ts1cmss.fd}
53 \input {ts1cmtt.fd}
54 \endgroup

```

Even though Unicode engines default to `\lm` load `ts1cmr` as this may be used for fallback for TS1 encoding.

We now load it in all engines above, so the next lines are no longer necessary. We keep them here if we stop loading other fd files in Unicode engines.

```

55 \%ifx\Umathcode\@undefined\else
56 \%begingroup
57 \%nfss@catcodes
58 \%input {ts1cmr.fd}
59 \%endgroup
60 \%fi

```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a `.fd` file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```
61 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}
```

This means, “if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding”. You can change the font used but the encoding should be the same as the one specified with `\fontencoding` above.

5.2 Defaults

To allow the use of `\rmfamily`, `\sffamily`, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for `\encodingdefault`) without making documents non-portable.

```

\encodingdefault The following three definitions set up the meaning for \rmfamily, \sffamily, and
\rmdefault \ttfamily.
\sfdefault
62 \%ifx\Umathcode\@undefined
63 \newcommand\encodingdefault{OT1}
64 \newcommand\rmdefault{cmr}
65 \newcommand\sfdefault{cmss}
66 \newcommand\ttdefault{cmtt}
67 \%else
68 \newcommand\encodingdefault{TU}
69 \newcommand\rmdefault{lmr}
70 \fontfamily{\rmdefault}
71 \newcommand\sfdefault{lmss}
72 \newcommand\ttdefault{lmtt}
73 \%fi
74 
75 <texrelease>\IncludeInRelease{2017/01/01}%
76 <texrelease> \encodingdefault{TU encoding default}%

```

```

77 〈latexrelease〉\ifx\Umathcode\@undefined
78 〈latexrelease〉\renewcommand\encodingdefault{OT1}
79 〈latexrelease〉\fontencoding{\encodingdefault}
80 〈latexrelease〉\renewcommand\rmdefault{cmr}
81 〈latexrelease〉\fontfamily{\rmdefault}
82 〈latexrelease〉\renewcommand\sffont{cmss}
83 〈latexrelease〉\renewcommand\ttdefault{cmtt}
84 〈latexrelease〉\else
85 〈latexrelease〉\renewcommand\encodingdefault{TU}
86 〈latexrelease〉%done in everyjob\fontencoding{\encodingdefault}
87 〈latexrelease〉\renewcommand\rmdefault{lmr}
88 〈latexrelease〉\fontfamily{\rmdefault}
89 〈latexrelease〉\renewcommand\sffont{lmss}
90 〈latexrelease〉\renewcommand\ttdefault{lmtt}
91 〈latexrelease〉\fi
92 〈latexrelease〉\EndIncludeInRelease
93 〈latexrelease〉\IncludeInRelease{0000/00/00}%
94 〈latexrelease〉\encodingdefault{TU encoding default}%
95 〈latexrelease〉\fontencoding{OT1}
96 〈latexrelease〉\renewcommand\encodingdefault{OT1}
97 〈latexrelease〉\fontencoding{\encodingdefault}
98 〈latexrelease〉\renewcommand\rmdefault{cmr}
99 〈latexrelease〉\fontfamily{\rmdefault}
100 〈latexrelease〉\renewcommand\sffont{cmss}
101 〈latexrelease〉\renewcommand\ttdefault{cmtt}
102 〈latexrelease〉\EndIncludeInRelease
103 〈*text〉

```

(End of definition for `\encodingdefault` and others.)

<code>\bfdefault</code>	Series changing commands are influenced by the following hooks.
<code>\mddefault</code>	<code>\newcommand\bfdefault{b}</code> % overwritten below (for rollback)
	<code>\newcommand\mddefault{m}</code> % overwritten below (for rollback)

(End of definition for `\bfdefault` and `\mddefault`.)

<code>\itdefault</code>	Shape changing commands use the following hooks.
<code>\sldefault</code>	<code>\newcommand\itdefault{it}</code>
<code>\scdefault</code>	<code>\newcommand\sldefault{sl}</code>
<code>\updefault</code>	<code>\newcommand\scdefault{sc}</code>
	<code>\newcommand\updefault{up}</code> % overwritten below (for rollback)

(End of definition for `\itdefault` and others.)

```

110 〈/text〉
111 〈*text | latexrelease〉
112 〈latexrelease〉\IncludeInRelease{2020/02/02}%
113 〈latexrelease〉\updefault{font defaults change}%
114 \renewcommand\updefault{up}

```

We append `\@empty` to the series value so that we can detect if it got changed via `\def` or `\renewcommand` later.

```

115 \renewcommand\bfdefault{b\@empty}
116 \renewcommand\mddefault{m\@empty}

```

```

117 \let\bfdefault@previous\bfdefault
118 \let\mddefault@previous\mddefault
119 </text | latexrelease>
120 <latexrelease>\EndIncludeInRelease
121 <latexrelease>\IncludeInRelease{0000/00/00}%
122 <latexrelease> {\updefault}{font defaults change}%
123 <latexrelease>
124 <latexrelease>\renewcommand\updefault{n}
125 <latexrelease>\renewcommand\bfdefault{bx}
126 <latexrelease>
127 <latexrelease>\let\bfdefault@previous\undefined
128 <latexrelease>\let\mddefault@previous\undefined
129 <latexrelease>\EndIncludeInRelease
130 <*text>

```

\familydefault Finally we have the hooks that describe the behaviour of the `\normalfont` command.
\seriesdefault To stay portable, the definition of `\encodingdefault` should *not* be changed and should
\shapedefault match the setting above for `\fontencoding`. All other values can be set according to
your taste.

```

131 \newcommand\familydefault{\rmdefault}
132 \newcommand\seriesdefault{\mddefault}

```

In previous releases `\shapedefault` pointed to `\updefault` which resolved to `n`, but
these days that is no longer the case (and up is wrong when you want to do a reset. So
we now use `n` explicitly.

```
133 \newcommand\shapedefault{n}
```

(*End of definition for `\familydefault`, `\seriesdefault`, and `\shapedefault`.*)

This finishes the low-level setup in `fonttext.ltx`.

```
134 </text>
```

6 The `fontmath.ltx` file

The identification is done earlier on with a `\ProvidesFile` declaration.

```

135 <*math>
136 \typeout{== Don't modify this file, use a .cfg file instead ==^J}

```

6.1 The font encodings used

```

137 \DeclareFontEncoding{OML}{}{}
138 \DeclareFontEncoding{OMS}{}{}
139 \DeclareFontEncoding{OMX}{}{}

```

Finally a declaration for U encoding which serves for all fonts that do not fit standard
encodings. For math this sets up `\noaccents@` providing for AMS-L^AT_EX. This macro
is used therein to handle accented characters if they are not supported by the font. In
other words, if fonts with U encoding are used in math, all accents (like from `\breve`) are
obtained from some other font that has them.

```
140 \DeclareFontEncoding{U}{}{\noaccents@}
```

The encodings for math are next:

```

141 \DeclareFontSubstitution{OML}{cmm}{m}{it}
142 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}

```

```

143 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
144 \DeclareFontSubstitution{U}{cmr}{m}{n}
145 \begingroup
146 \nfss@catcodes
147 \input {omlcmm.fd}
148 \input {oms cmsy .fd}
149 \input {omx cmex .fd}
150 \input {ucmr .fd}
151 \endgroup

```

6.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by L^AT_EX. These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. `operators` with OT1 etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```

152 \DeclareSymbolFont{operators} {OT1}{cmr}{m}{n}
153 \DeclareSymbolFont{letters} {OML}{cmm}{m}{it}
154 \DeclareSymbolFont{symbols} {OMS}{cmsy}{m}{n}
155 \DeclareSymbolFont{largetsymbol}{OMX}{cmex}{m}{n}
156 \SetSymbolFont{operators}{bold}{OT1}{cmr}{bx}{n}
157 \SetSymbolFont{letters} {bold}{OML}{cmm}{b}{it}
158 \SetSymbolFont{symbols} {bold}{OMS}{cmsy}{b}{n}

```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```

159 \DeclareSymbolFontAlphabet{\mathrm}{operators}
160 \DeclareSymbolFontAlphabet{\mathnormal}{letters}
161 \DeclareSymbolFontAlphabet{\mathcal}{symbols}
162 \DeclareMathAlphabet{\mathbf}{OT1}{cmr}{bx}{n}
163 \DeclareMathAlphabet{\mathsf}{OT1}{cmss}{m}{n}
164 \DeclareMathAlphabet{\mathit}{OT1}{cmr}{m}{it}
165 \DeclareMathAlphabet{\mathtt}{OT1}{cmtt}{m}{n}

```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```

166 \SetMathAlphabet{\mathsf}{bold}{OT1}{cmss}{bx}{n}
167 \SetMathAlphabet{\mathit}{bold}{OT1}{cmr}{bx}{it}

```

6.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```

168 \DeclareMathSizes{5}{5}{5}{5}
169 \DeclareMathSizes{6}{6}{5}{5}
170 \DeclareMathSizes{7}{7}{5}{5}
171 \DeclareMathSizes{8}{8}{6}{5}
172 \DeclareMathSizes{9}{9}{6}{5}
173 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
174 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
175 \DeclareMathSizes{\@xiipt}{\@xiipt}{8}{6}
176 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
177 \DeclareMathSizes{\@xviipt}{\@xviipt}{\@xiipt}{\@xpt}
178 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xiipt}
179 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xviipt}

```

6.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by IniT_EX. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

6.3.1 The letters

```

180 \DeclareMathSymbol{a}{\mathalpha}{letters}{`a}
181 \DeclareMathSymbol{b}{\mathalpha}{letters}{`b}
182 \DeclareMathSymbol{c}{\mathalpha}{letters}{`c}
183 \DeclareMathSymbol{d}{\mathalpha}{letters}{`d}
184 \DeclareMathSymbol{e}{\mathalpha}{letters}{`e}
185 \DeclareMathSymbol{f}{\mathalpha}{letters}{`f}
186 \DeclareMathSymbol{g}{\mathalpha}{letters}{`g}
187 \DeclareMathSymbol{h}{\mathalpha}{letters}{`h}
188 \DeclareMathSymbol{i}{\mathalpha}{letters}{`i}
189 \DeclareMathSymbol{j}{\mathalpha}{letters}{`j}
190 \DeclareMathSymbol{k}{\mathalpha}{letters}{`k}
191 \DeclareMathSymbol{l}{\mathalpha}{letters}{`l}
192 \DeclareMathSymbol{m}{\mathalpha}{letters}{`m}
193 \DeclareMathSymbol{n}{\mathalpha}{letters}{`n}
194 \DeclareMathSymbol{o}{\mathalpha}{letters}{`o}
195 \DeclareMathSymbol{p}{\mathalpha}{letters}{`p}
196 \DeclareMathSymbol{q}{\mathalpha}{letters}{`q}
197 \DeclareMathSymbol{r}{\mathalpha}{letters}{`r}
198 \DeclareMathSymbol{s}{\mathalpha}{letters}{`s}
199 \DeclareMathSymbol{t}{\mathalpha}{letters}{`t}
200 \DeclareMathSymbol{u}{\mathalpha}{letters}{`u}
201 \DeclareMathSymbol{v}{\mathalpha}{letters}{`v}
202 \DeclareMathSymbol{w}{\mathalpha}{letters}{`w}
203 \DeclareMathSymbol{x}{\mathalpha}{letters}{`x}
204 \DeclareMathSymbol{y}{\mathalpha}{letters}{`y}
205 \DeclareMathSymbol{z}{\mathalpha}{letters}{`z}
206 \DeclareMathSymbol{A}{\mathalpha}{letters}{`A}
207 \DeclareMathSymbol{B}{\mathalpha}{letters}{`B}
208 \DeclareMathSymbol{C}{\mathalpha}{letters}{`C}
209 \DeclareMathSymbol{D}{\mathalpha}{letters}{`D}
210 \DeclareMathSymbol{E}{\mathalpha}{letters}{`E}

```

```

211 \DeclareMathSymbol{F}{\mathalpha}{letters}{`F}
212 \DeclareMathSymbol{G}{\mathalpha}{letters}{`G}
213 \DeclareMathSymbol{H}{\mathalpha}{letters}{`H}
214 \DeclareMathSymbol{I}{\mathalpha}{letters}{`I}
215 \DeclareMathSymbol{J}{\mathalpha}{letters}{`J}
216 \DeclareMathSymbol{K}{\mathalpha}{letters}{`K}
217 \DeclareMathSymbol{L}{\mathalpha}{letters}{`L}
218 \DeclareMathSymbol{M}{\mathalpha}{letters}{`M}
219 \DeclareMathSymbol{N}{\mathalpha}{letters}{`N}
220 \DeclareMathSymbol{O}{\mathalpha}{letters}{`O}
221 \DeclareMathSymbol{P}{\mathalpha}{letters}{`P}
222 \DeclareMathSymbol{Q}{\mathalpha}{letters}{`Q}
223 \DeclareMathSymbol{R}{\mathalpha}{letters}{`R}
224 \DeclareMathSymbol{S}{\mathalpha}{letters}{`S}
225 \DeclareMathSymbol{T}{\mathalpha}{letters}{`T}
226 \DeclareMathSymbol{U}{\mathalpha}{letters}{`U}
227 \DeclareMathSymbol{V}{\mathalpha}{letters}{`V}
228 \DeclareMathSymbol{W}{\mathalpha}{letters}{`W}
229 \DeclareMathSymbol{X}{\mathalpha}{letters}{`X}
230 \DeclareMathSymbol{Y}{\mathalpha}{letters}{`Y}
231 \DeclareMathSymbol{Z}{\mathalpha}{letters}{`Z}

```

6.3.2 The digits

```

232 \DeclareMathSymbol{0}{\mathalpha}{operators}{`0}
233 \DeclareMathSymbol{1}{\mathalpha}{operators}{`1}
234 \DeclareMathSymbol{2}{\mathalpha}{operators}{`2}
235 \DeclareMathSymbol{3}{\mathalpha}{operators}{`3}
236 \DeclareMathSymbol{4}{\mathalpha}{operators}{`4}
237 \DeclareMathSymbol{5}{\mathalpha}{operators}{`5}
238 \DeclareMathSymbol{6}{\mathalpha}{operators}{`6}
239 \DeclareMathSymbol{7}{\mathalpha}{operators}{`7}
240 \DeclareMathSymbol{8}{\mathalpha}{operators}{`8}
241 \DeclareMathSymbol{9}{\mathalpha}{operators}{`9}

```

6.3.3 Punctuation, brace, etc. keys

```

242 \DeclareMathSymbol{!}{\mathclose}{operators}{`21}
243 \DeclareMathSymbol{*}{\mathbin}{symbols}{`03} % \ast
244 \DeclareMathSymbol{+}{\mathbin}{operators}{`2B}
245 \DeclareMathSymbol{,}{\mathpunct}{letters}{`3B}
246 \DeclareMathSymbol{-}{\mathbin}{symbols}{`00}
247 \DeclareMathSymbol{.}{\mathord}{letters}{`3A}
248 \DeclareMathSymbol{:}{\mathrel}{operators}{`3A}
249 \DeclareMathSymbol{;}{\mathpunct}{operators}{`3B}
250 \DeclareMathSymbol{=}{\mathrel}{operators}{`3D}
251 \DeclareMathSymbol{?}{\mathclose}{operators}{`3F}

```

The following symbols are defined as delimiters below which automatically defines them as math symbols.

```

252 \% \DeclareMathSymbol{()}{\mathopen}{operators}{`28}
253 \% \DeclareMathSymbol{}{\mathclose}{operators}{`29}
254 \% \DeclareMathSymbol{/}{\mathord}{letters}{`3D}
255 \% \DeclareMathSymbol{[]}{\mathopen}{operators}{`5B}
256 \% \DeclareMathSymbol{}{\mathclose}{operators}{`5D}
257 \% \DeclareMathSymbol{|}{\mathord}{symbols}{`6A}

```

```

258 \%DeclarMathSymbol{<}{\mathrel}{letters}"3C}
259 \%DeclarMathSymbol{>}{\mathrel}{letters}"3E}

```

Should all of the following being activated by default? Probably not.

```

260 \%DeclarMathSymbol{'\{}{\mathopen}{symbols}"66}
261 \%DeclarMathSymbol{'\}}{\mathclose}{symbols}"67}
262 \%DeclarMathSymbol{'\\}{\mathord}{symbols}"6E} % \backslash
263 \mathcode`\"=8000 % \space
264 \mathcode`'=8000 % ^\prime
265 \mathcode`\_="8000 % \

```

6.3.4 Delimitercodes for characters

[to be completed]

Finally, InTiEX sets all `\delcode` values to -1, except `\delcode'=.0`

```

266 \DeclarMathDelimiter{{}{\mathopen}} {operators}"28}{largesymbols}"00}
267 \DeclarMathDelimiter{}{\mathclose}{operators}"29}{largesymbols}"01}
268 \DeclarMathDelimiter{{}{\mathopen}} {operators}"5B}{largesymbols}"02}
269 \DeclarMathDelimiter{}{\mathclose}{operators}"5D}{largesymbols}"03}

```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain TeX. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```

270 \DeclarMathDelimiter{<}{\mathopen}{symbols}"68}{largesymbols}"0A}
271 \DeclarMathDelimiter{>}{\mathclose}{symbols}"69}{largesymbols}"0B}
272 \DeclarMathSymbol{<}{\mathrel}{letters}"3C}
273 \DeclarMathSymbol{>}{\mathrel}{letters}"3E}

```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```

274 \DeclarMathDelimiter{/}{\mathord}{operators}"2F}{largesymbols}"0E}
275 \DeclarMathSymbol{/}{\mathord}{letters}"3D}
276 \DeclarMathDelimiter{|}{\mathord}{symbols}"6A}{largesymbols}"0C}
277 \expandafter\DeclarMathDelimiter@backslashchar
278 \mathord}{symbols}"6E}{largesymbols}"0F}

```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

6.4 Symbols accessed via control sequences

6.4.1 Greek letters

```

279 \DeclarMathSymbol{\alpha}{\mathord}{letters}"0B}
280 \DeclarMathSymbol{\beta}{\mathord}{letters}"0C}
281 \DeclarMathSymbol{\gamma}{\mathord}{letters}"0D}
282 \DeclarMathSymbol{\delta}{\mathord}{letters}"0E}
283 \DeclarMathSymbol{\epsilon}{\mathord}{letters}"0F}
284 \DeclarMathSymbol{\zeta}{\mathord}{letters}"10}
285 \DeclarMathSymbol{\eta}{\mathord}{letters}"11}
286 \DeclarMathSymbol{\theta}{\mathord}{letters}"12}
287 \DeclarMathSymbol{\iota}{\mathord}{letters}"13}
288 \DeclarMathSymbol{\kappa}{\mathord}{letters}"14}
289 \DeclarMathSymbol{\lambda}{\mathord}{letters}"15}
290 \DeclarMathSymbol{\mu}{\mathord}{letters}"16}
291 \DeclarMathSymbol{\nu}{\mathord}{letters}"17}

```

```

292 \DeclareMathSymbol{\xi}{\mathord}{letters}{18}
293 \DeclareMathSymbol{\pi}{\mathord}{letters}{19}
294 \DeclareMathSymbol{\rho}{\mathord}{letters}{1A}
295 \DeclareMathSymbol{\sigma}{\mathord}{letters}{1B}
296 \DeclareMathSymbol{\tau}{\mathord}{letters}{1C}
297 \DeclareMathSymbol{\upsilon}{\mathord}{letters}{1D}
298 \DeclareMathSymbol{\phi}{\mathord}{letters}{1E}
299 \DeclareMathSymbol{\chi}{\mathord}{letters}{1F}
300 \DeclareMathSymbol{\psi}{\mathord}{letters}{20}
301 \DeclareMathSymbol{\omega}{\mathord}{letters}{21}
302 \DeclareMathSymbol{\varepsilon}{\mathord}{letters}{22}
303 \DeclareMathSymbol{\vartheta}{\mathord}{letters}{23}
304 \DeclareMathSymbol{\varpi}{\mathord}{letters}{24}
305 \DeclareMathSymbol{\varrho}{\mathord}{letters}{25}
306 \DeclareMathSymbol{\varsigma}{\mathord}{letters}{26}
307 \DeclareMathSymbol{\varphi}{\mathord}{letters}{27}
308 \DeclareMathSymbol{\Gamma}{\mathalpha}{operators}{00}
309 \DeclareMathSymbol{\Delta}{\mathalpha}{operators}{01}
310 \DeclareMathSymbol{\Theta}{\mathalpha}{operators}{02}
311 \DeclareMathSymbol{\Lambda}{\mathalpha}{operators}{03}
312 \DeclareMathSymbol{\Xi}{\mathalpha}{operators}{04}
313 \DeclareMathSymbol{\Pi}{\mathalpha}{operators}{05}

483 \DeclareRobustCommand
484 \relbar{\mathrel{\smash-}} % \smash, because -
485 % has the same height as +

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet...`. This might be the case when packages are implementing shorthands for math, e.g. `=` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathqualsign` and use this. However we can’t do this now as it would break other math layouts where characters are in different places (since those wouldn’t know about the need for a new command name).

```

617 \DeclareMathDelimiter{\lfloor}
618   {\mathopen}{symbols}{62}{largesymbols}{04}

```

\lgroup There are three plain TeX delimiters which are not fully supported by NFSS, since they partly point into a bold cmr font. Allocating a full symbol font, just to have three delimiters seems a bit too much given the limited space available. For this reason only the extensible sizes are supported. If this is not desired one can use, without losing portability, define \mathbf and \mathtt as font symbol alphabet (setting up cmr/bx/n and cmtt/m/n as symbol fonts first) and modify the delimiter declarations to point with their small variant to those symbol fonts. (This is done in `oldlfont.dtx` so look there for examples.)

```

619 \DeclareMathDelimiter{\lgroup} % extensible ( with sharper tips
620   {\mathopen}{largesymbols}{3A}{largesymbols}{3A}
621 \DeclareMathDelimiter{\rgroup} % extensible ) with sharper tips
622   {\mathclose}{largesymbols}{3B}{largesymbols}{3B}
623 \DeclareMathDelimiter{\bracevert} % the vertical bar that extends braces
624   {\mathord}{largesymbols}{3E}{largesymbols}{3E}

```

(End of definition for \lgroup, \rgroup, and \bracevert.)

6.5 Math versions of text commands

The \mathunderscore here is really a text definition, so it has been put back into `ltoutenc.dtx` (by Chris, 30/04/97) and should be removed from here.

These symbols are the math versions of text commands such as \P, \\$, etc.

```

\mathparagraph These math symbols are not in plain TeX.
\mathsection
\mathdollar
\mathsterling
\mathunderscore
625 \DeclareMathSymbol{\mathparagraph}{\mathord}{symbols}{7B}

File 31

preload.dtx

1 Overview

This file contains a number of possible settings for preloading fonts during installation of NFSS2 (which is used by L^AT_EX 2 _{ε}). It will be used to generate the following files:

preload.min	minimal subset of fonts necessary to run NFSS2
preload.ori	preload of CM fonts similar to the old <code>1fonts.tex</code>
preload.ltx	The standard selection of preloads
cmpreload.xpt	preload of CM fonts for 10pt document size
cmpreload.xip	preload of CM fonts for 11pt document size
cmpreload.xii	preload of CM fonts for 12pt document size
dcpreload.xpt	preload of DC fonts for 10pt size
dcpreload.xip	preload of DC fonts for 11pt size
dcpreload.xii	preload of DC fonts for 12pt size

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

2 Customization

You can customize the preloaded fonts in your L^AT_EX 2 _{ε} system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by *all* L^AT_EX 2 _{ε} systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by L^AT_EX 2.09.

If you normally use other fonts than Computer Modern `preload.min` might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

3 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

driver	produce a documentation driver file
preload	produce a preload... file
cm	for OT1 encoded Computer Modern
dc	for T1 encoded Computer Modern
min	produce minimal subset
xpt	produce 10pt preloads
xipt	produce 11pt preloads
xiipt	produce 12pt preloads
ori	produce preloads similar to old <code>lfonts.tex</code>
tex	produce preload.ltx

A typical DOCSTRIP command file would then have entries like:

```
generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

4 A driver for this document

The next bit of code contains the documentation driver file for \TeX , i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1  {*driver}
2  \documentclass{ltxdoc}
3  %\OnlyDescription % comment out for implementation details
4  \begin{document}
5    \DocInput{preload.dtx}
6  \end{document}
7  
```

5 The code

We begin by loading the math extension font (`cmex10`) and the \LaTeX line and circle fonts. It is necessary to do this explicitly since these are used by the \LaTeX format. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```
8  \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9  \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 {-tex}*****%
12 {-tex}% Start any modification below this point **
13 {-tex}*****%
14 {-tex}%
15 %%%
16 %% Computer Modern Roman:

File 32

ltfntcmd.dtx

Abstract

The commands defined in this file `ltfntcmd` are part of the kernel code for L^AT_EX 2_&/NFSS2.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

1 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the T_EX system and for several reasons it is better to avoid them on the user level whenever possible. In L^AT_EX3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text...`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 3 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.³⁹ The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,.}
```

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,  
the \emph{proper} use of italic corrections is  
automatically taken care of}. Only
```

³⁹Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

<i>Command</i>	<i>Corresponds to</i>	<i>Action</i>
<code>\textnormal{..}</code>	<code>\normalfont</code>	Typeset argument in normal family
<code>\textrm{..}</code>	<code>\rmfamily</code>	Typeset argument in roman family
<code>\textsf{..}</code>	<code>\sffamily</code>	Typeset argument in <code>sans serif</code> family
<code>\texttt{..}</code>	<code>\ttfamily</code>	Typeset argument in <code>typewriter</code> family
<code>\textmd{..}</code>	<code>\mdseries</code>	Typeset argument in medium series
<code>\textbf{..}</code>	<code>\bfseries</code>	Typeset argument in bold series
<code>\textup{..}</code>	<code>\upshape</code>	Typeset argument in normal shape
<code>\textit{..}</code>	<code>\itshape</code>	Typeset argument in <i>italic</i> shape
<code>\textsl{..}</code>	<code>\slshape</code>	Typeset argument in <i>slanted</i> shape
<code>\textsc{..}</code>	<code>\scshape</code>	Typeset argument in <code>SMALL CAPS</code> shape
<code>\emph{..}</code>	<code>\em</code>	Typeset argument <i>emphasized</i>

Table 3: Font-change commands with arguments

The font change commands provided here all start with `\text..` to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

`\emph{sometimes}` one has to help `\LaTeX{}` by adding a `\verb=\nocorr=` command.

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L^AT_EX by adding a `\nocorr` command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
{\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
      \texttt{itemize} environment and NFSS
      declarations.
\end{bfitemize}
```

This gives:

- This environment produces boldface items.
- It is defined in terms of L^AT_EX's `itemize` environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with `\!/`.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a `\V` in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of `\V` in `amstex.sty` is used as this version can cause space to be removed immediately before the `\V`.

2 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text..` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automagically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimizes this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```
1  {*2ekernel}
2  \def \DeclareTextFontCommand #1#2{%
3    \DeclareRobustCommand#1[1]{%
4      \ifmmode
5        \nfss@text{#2##1}%
6      \else
7        \hmode@bgroup
8        \text@command{##1}%
9        #2\check@icl ##1\check@icr
10       \expandafter
11       \egroup
12     \fi
13   }%
14 }
```

(End of definition for `\DeclareTextFontCommand`.)

`\textrm` Now we define the `\text<family>` commands in terms of the above; `\textttt` does not look very nice!

`\textsf` 15 `\DeclareTextFontCommand{\textrm}{\rmfamily}`
`\textnormal` 16 `\DeclareTextFontCommand{\textsf}{\sffamily}`
17 `\DeclareTextFontCommand{\textttt}{\ttfamily}`
18 `\DeclareTextFontCommand{\textnormal}{\normalfont}`

(End of definition for `\textrm` and others.)

`\textbf` For the series attribute:

`\textmd` 19 `\DeclareTextFontCommand{\textbf}{\bfseries}`
20 `\DeclareTextFontCommand{\textmd}{\mdseries}`

(End of definition for `\textbf` and `\textmd`.)

`\textit` And for the shapes:

`\textsl` 21 `\DeclareTextFontCommand{\textit}{\itshape}`
`\textsc` 22 `\DeclareTextFontCommand{\textsl}{\slshape}`
`\textup` 23 `\DeclareTextFontCommand{\textsc}{\scshape}`
24 `\DeclareTextFontCommand{\textup}{\upshape}`

(End of definition for `\textit` and others.)

`\textulc`
`\textsw` 25 `/2ekernel`
`\textssc` 26 `{*2ekernel | latexrelease}`
27 `\langle latexrelease \rangle \IncludeInRelease{2020/02/02} %`
28 `\langle latexrelease \rangle \textulc{\AdditionalTextCommands} %`
29 `\DeclareTextFontCommand{\textulc}{\ulcshape}`
30 `\DeclareTextFontCommand{\textsw}{\swshape}`
31 `\DeclareTextFontCommand{\textssc}{\sscshape}`
32 `\langle /2ekernel | latexrelease \rangle`
33 `\langle latexrelease \rangle \EndIncludeInRelease`
34 `\langle latexrelease \rangle \IncludeInRelease{0000/00/00} %`
35 `\langle latexrelease \rangle \textulc{\AdditionalTextCommands} %`
36 `\langle latexrelease \rangle`
37 `\langle latexrelease \rangle \let\textulc\@undefined`
38 `\langle latexrelease \rangle \let\textsw\@undefined`
39 `\langle latexrelease \rangle \let\textssc\@undefined`
40 `\langle latexrelease \rangle \EndIncludeInRelease`
41 `{*2ekernel}`

(End of definition for `\textulc`, `\textsw`, and `\textssc`.)

`\emph` Finally we have the `\em` font change declaration of L^AT_EX. The corresponding definition with argument is

42 `\DeclareTextFontCommand{\emph}{\em}`

(End of definition for `\emph`.)

`\nocorr` This is just a label, so it does nothing; it should also be unexpandable.

43 `\let\nocorr\relax`

(End of definition for \nocorr.)

- \check@ic1 We define these defaults in case some error causes them to be expanded at the wrong time.
\check@icr

```
44 \let \check@ic1 \@empty  
45 \let \check@icr \@empty
```

(End of definition for \check@ic1 and \check@icr.)

- \text@command This checks for a \nocorr as the first token in its argument and also for one in any other position not protected within braces (the latter is treated as if it were at the end of the argument).

Is this the correct action in the ‘empty’ case? It is efficient but typographically it is, strictly, incorrect!

```
46 \def \text@command #1{  
47   \edef \reserved@a {\unexpanded{#1}}%  
48   \ifx \reserved@a \@empty  
49     \let \check@ic1 \@empty  
50     \let \check@icr \@empty  
51   \else
```

\space is a reserved word in L^AT_EX or actually already in plain T_EX. If somebody really redefines it so many things will break that I don’t see any reason to make this routine here slower than necessary.

```
52 %   \def \reserved@b { }%  
53 %   \ifx \reserved@a \reserved@b  
54   \ifx \reserved@a \space  
55     \let \check@ic1 \@empty  
56     \let \check@icr \@empty  
57   \else  
58     \check@nocorr@ #1\nocorr@nil  
59   \fi  
60 \fi  
61 }  
62 \def \check@nocorr@ #1#2\nocorr#3@nil {%
```

The two checks are initialised here to their values in the normal case.

```
63 \let \check@ic1 \maybe@ic  
64 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi} %  
65 \def \reserved@a {\nocorr}%  
66 \def \reserved@b {#1}%  
67 \def \reserved@c {#3}%  
68 \ifx \reserved@a \reserved@b  
69   \ifx \reserved@c \@empty
```

In this case there is a \nocorr at the start but not at the end, so \check@ic1 should be empty.

```
70   \let \check@ic1 \@empty  
71 \else
```

Otherwise there is a \nocorr both at the start and elsewhere, so no italic corrections should be added.

```
72   \let \check@ic1 \@empty  
73   \let \check@icr \@empty  
74 \fi
```

```

75   \else
76     \ifx \reserved@c \empty
```

In this case there is no `\nocorr` anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```

77   \else
```

In this case there is no `\nocorr` at the start but there is one elsewhere, so no `\aftergroup` is needed.

```

78     \let \check@icr \empty
79     \fi
80   \fi
81 }
```

(End of definition for `\text@command` and `\check@nocorr@`.)

`\ifmaybe@ic` Switch used solely within `\maybe@ic` not interfering with other switches.

```

82 \newif\ifmaybe@ic
```

(End of definition for `\ifmaybe@ic`.)

`\maybe@ic` These macros implement the italic correction.

```

\maybe@ic@ 83 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
84 \def \maybe@ic@ {\%
```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```

85 \ifdim \fontdimen@ne\font>\z@
86 \else
87   \maybe@ictrue
```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```

88 \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
89   \nocorlist
```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```

90 \do \t@st@ic
```

Frank thinks that the next bit is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```

91   \ifmaybe@ic \sw@slant \fi
92   \fi
93 }
```

(End of definition for `\maybe@ic` and `\maybe@ic@`.)

`\t@st@ic` The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```

94 \def \t@st@ic {%
95   \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
96   \ifx\reserved@b\@let@token

```

If they are the same we record the fact and jump out of the loop.

```

97   \maybe@icfalse
98   \@break@tfor
99   \fi
100 }

```

(End of definition for `\t@st@ic`.)

`\sw@slant` The definition of the mysterious `\sw@slant` command is as follows.

```

101 \def \sw@slant {%

```

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `\~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```

102 \ifdim \lastskip=\z@
103   \fix@penalty
104 \else
105   \skip@\lastskip
106   \unskip
107   \fix@penalty
108   \hskip \skip@
109 \fi
110 }

```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@\lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard L^AT_EX code?

```

111 \def \fix@penalty {%
112   \ifnum \lastpenalty=\z@
113     \@@italiccorr
114   \else
115     \count@\lastpenalty
116     \unpenalty
117     \@@italiccorr

```

```

118      \penalty \count0
119  \fi
120 }

```

(End of definition for `\sw@slant` and `\fix@penalty`.)

- `\nocorrlist` This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```

121 \def \nocorrlist {,.}

```

(End of definition for `\nocorrlist`.)

- `\nfss@text` This command will by default behave like a L^AT_EX `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```

122 \ifx \nfss@text \undefined
123   \def \nfss@text {\leavevmode\hbox}
124 \fi

```

(End of definition for `\nfss@text`.)

- `\DeclareOldFontCommand` This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{\<font-change decls>} {\<math-alphabet>}`

Here `\fn` is the font-declaration command being defined, `\<font-change decls>` is the declaration it will expand to in text-mode, and `\<math-alphabet>` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```

\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\DeclareOldFontCommand{\sf}{\normalfont\sfamily}{\mathrm{sf}}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathrm{tt}}

```

```

125 \def \DeclareOldFontCommand #1#2#3{%
126   \ DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
127 }

```

(End of definition for `\DeclareOldFontCommand`.)

- `\@fontswitch` These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```

128 \def \@fontswitch #1#2{%
129   \ifmmode
130     \let \math@bgroup \relax
131     \def \math@egroup {\let \math@bgroup \@@math@bgroup
132                           \let \math@egroup \@@math@egroup}%

```

We need to have a `\relax` in the following line in case the #2 is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
133     #2\relax
134 \else
135     #1%
136 \fi
137 }
138 \let \@@math@bgroup \math@bgroup
139 \let \@@math@egroup \math@egroup

(End of definition for \fontswitch, \math@bgroup, and \math@egroup.)
These commands are available only in the preamble.

140 \onlypreamble \DeclareTextFontCommand
141 \onlypreamble \DeclareOldFontCommand
```

3 Initialization

`\normalsize` This is defined to produce an error.

```
142 \def\normalsize{%
143   \@latex@error {The font size command \protect\normalsize\space
144     is not defined:\MessageBreak
145     there is probably something wrong with
146     the class file}\@eha
147 }
148 ⟨/2ekernel⟩

(End of definition for \normalsize.)
```

File 33

lttextcomp.dtx

This file contains the implementation for accessing the glyphs provided by the TS1 encoding (Text Companion Encoding). This is now offered as part of the kernel and so the `textcomp` package which used to provide the definitions is now mainly needed for compatibility reasons (and doesn't do much any more).

```
1  {*2ekernel | latexrelease}
2  <latexrelease>\NewModuleRelease{2020/02/02}{lttextcomp}
3  <latexrelease>          {Text Companion symbols}
```

`\oldstylenums` Preserve the old definition of `\oldstylenums` under a different name.

`\legacyoldstylenums` This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
4  \DeclareRobustCommand\legacyoldstylenums[1]{%
5    \begingroup
```

Provide spacing using the interword space of the current font.

```
6    \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard L^AT_EX fonts even though they only contain substitutions).

```
7    \usefont{OML}{\rmdefault}{\f@series}{it}%
8    \mathgroup\symletters #1%
9    \endgroup
10 }
```

And here is the improved one that adjusts depending on surroundings.

```
11 \DeclareRobustCommand\oldstylenums[1]{%
12   \begingroup
13   \ifmmode
14     \mathgroup\symletters #1%
15   \else
```

The `\CheckEncodingSubset` is discussed below.

```
16   \CheckEncodingSubset\use@text@encoding{TS1}\tc@oldstylesubst2{{#1}}%
17   \fi
18   \endgroup
19 }
```

The helper to select the substitution if needed.

```
20 \def\tc@oldstylesubst#1{%
21   \tc@errorwarn
22   {Oldstyle digits unavailable for
23    family \f@family.\MessageBreak
24    Default oldstyle digits used instead}\@eha
25   \bgroup
26     \expand@font@defaults
```

The substitution defaults are provided in the file `fonttext.ltx`.

```
27   \ifx\f@family\rmdef@ult
28     \fontfamily\rmsubstdefault
29   \else\ifx\f@family\sfdef@ult
30     \fontfamily\sfsbstdefault
31   \else\ifx\f@family\ttdef@ult
32     \fontfamily\ttsbstdefault
33   \else
34     \fontfamily\textcompsubstdefault
35   \fi\fi\fi
36   \fontencoding{TS1}\selectfont#1%
37 \egroup
38 }
```

(End of definition for `\oldstylenums` and `\legacyoldstylenums`.)

`\textcompsubstdefault` Here is the default for the “unknown” case:

```
39 \def\textcompsubstdefault{\rmsubstdefault}
```

(End of definition for `\textcompsubstdefault`.)

To set up the glyphs for the subsets we need a number helpers.

`\tc@errorwarn` To we produce errors, warnings, or only info in the transcripts if glyphs require substitutions? By default it is “info” only. With the `textcomp` package that can be changed.

```
40 \def\tc@errorwarn#1#2{@latex@info{#1}}
```

(End of definition for `\tc@errorwarn`.)

`\tc@subst`

```
41 \def\tc@subst#1{%
42   \tc@errorwarn
43   {Symbol \string#1 not provided by\MessageBreak
44   font family \f@family\space
45   in TS1 encoding.\MessageBreak Default family used instead}\@eha
46 \bgroup
47   \expand@font@defaults
48   \ifx\f@family\rmdef@ult
49     \fontfamily\rmsubstdefault
50   \else\ifx\f@family\sfdef@ult
51     \fontfamily\sfsbstdefault
52   \else\ifx\f@family\ttdef@ult
53     \fontfamily\ttsbstdefault
54   \else
55     \fontfamily\textcompsubstdefault
56   \fi\fi\fi}
```

Whatever default was chosen, we claim now (locally hopefully) that it can handle all slots (even if not true) to avoid looping in certain situations, e.g., when something was set up incorrectly.

```
57   \namedef{TS1:\f@family}{0}%
58   \selectfont#1%
59 \egroup
60 }
```

(End of definition for `\tc@subst`.)

\tc@fake@euro \tc@fake@euro is an example of a “fake” definition to use in arg #3 of the command \CheckEncodingSubset when a symbol is not available in a certain font family. Here we produce a poor man’s Euro symbol by combining a “C” with a “=”.

```

61 \def\tc@fake@euro#1{%
62   \leavevmode
63   \@font@info{Faking \noexpand#1for font family
64                           \f@family\MessageBreak in TS1 encoding}%
65   \valign{##\cr
66     \vfil\hbox to 0.07em{\dimen@\f@size\p@
67                           \math@fontsfalse
68                           \fontsize{.7\dimen@}\z@\selectfont=\hss}%
69     \vfil\cr%
70     \hbox{C}\crcr
71   }%
72 }
```

(End of definition for \tc@fake@euro.)

\tc@check@symbol \tc@check@accent These are two abbreviations that we use below to check symbols and accents in TS1. Only there to save some space, e.g., we can then write

```
DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}
```

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurrency is not available.

```
73 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
```

Accents have been made an error in the textcomp package when not available. Now that we provide the functionality in the kernel we avoid the error by swapping in a T1 accent if the TS1 accent is not available.

```

74 \% \def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
75 \def\tc@check@accent#1{\CheckEncodingSubset\UseTextAccent
76                           {TS1}\{\tc@swap@accent#1\}}
77 \def\tc@swap@accent#1#2{\UseTextAccent{T1}#1}
```

(End of definition for \tc@check@symbol and \tc@check@accent.)

1 Sub-encodings

Here are the default definitions for the TS1 symbols. First those that we assume are always available if a font implements TS1.

```

78 \DeclareTextSymbolDefault{\textdollar}{TS1}
79 \UndeclareTextCommand{\textdollar}{OT1} % don't use the OT1 def any longer
80 \DeclareTextSymbolDefault{\textsterling}{TS1}
81 \UndeclareTextCommand{\textsterling}{OT1} % don't use the OT1 def any longer
82 \DeclareTextSymbolDefault{\textperthousand}{TS1}
83 \UndeclareTextCommand{\textperthousand}{T1} % don't use the T1 def
```

Using `\UndeclareTextCommand` above is enough only if the encoding definition files are not reloaded afterwards. In the past that happened if `fontenc` was used in the document preamble (not any longer). So in some sense it is better to fully remove them from the encoding files, but for rollbacks it is easier to keep them in for now.

These are the standard `itemize` and footnote symbols originally taken from OMS and now from TS1:

```

84 \DeclareTextSymbolDefault{\textasteriskcentered}{TS1}
85 \DeclareTextSymbolDefault{\textbullet}{TS1}
86 \DeclareTextSymbolDefault{\textdaggerdbl}{TS1}
87 \DeclareTextSymbolDefault{\textdagger}{TS1}
88 \DeclareTextSymbolDefault{\textparagraph}{TS1}
89 \DeclareTextSymbolDefault{\textperiodcentered}{TS1}
90 \DeclareTextSymbolDefault{\textsection}{TS1}

```

And here are the other TS1 glyphs that are implemented by every font (or nearly every)—a few are commented out and moved to sub-encoding 9, because they aren't around in some fonts.

```

91 %%\DeclareTextSymbolDefault{\textbardbl}{TS1} % subst in sub-enc 9 above
92 \DeclareTextSymbolDefault{\textbrokenbar}{TS1}
93 %%\DeclareTextSymbolDefault{\textcelsius}{TS1} % subst in sub-enc 9 above
94 \DeclareTextSymbolDefault{\textcent}{TS1}
95 \DeclareTextSymbolDefault{\textcopyright}{TS1}
96 \DeclareTextSymbolDefault{\textdegree}{TS1}
97 \DeclareTextSymbolDefault{\textdiv}{TS1}
98 \DeclareTextSymbolDefault{\textlnot}{TS1}
99 \DeclareTextSymbolDefault{\textonehalf}{TS1}
100 \DeclareTextSymbolDefault{\textonequarter}{TS1}
101 %%\DeclareTextSymbolDefault{\textonesuperior}{TS1} % subst in sub-enc 9 above
102 \DeclareTextSymbolDefault{\textordfeminine}{TS1}
103 \DeclareTextSymbolDefault{\textordmasculine}{TS1}
104 \DeclareTextSymbolDefault{\textpm}{TS1}
105 \DeclareTextSymbolDefault{\textquotesingle}{TS1}
106 \DeclareTextSymbolDefault{\textquotestraightbase}{TS1}
107 \DeclareTextSymbolDefault{\textquotestraightdblbase}{TS1}
108 \DeclareTextSymbolDefault{\textregistered}{TS1}
109 %%\DeclareTextSymbolDefault{\textthreequartersemdash}{TS1} % subst in sub-enc 9 above
110 \DeclareTextSymbolDefault{\textthreequarters}{TS1}
111 %%\DeclareTextSymbolDefault{\textthreesuperior}{TS1} % subst in sub-enc 9 above
112 \DeclareTextSymbolDefault{\textttimes}{TS1}
113 \DeclareTextSymbolDefault{\texttrademark}{TS1}
114 %%\DeclareTextSymbolDefault{\texttwelveudash}{TS1} % subst in sub-enc 9 above
115 %%\DeclareTextSymbolDefault{\texttwosuperior}{TS1} % subst in sub-enc 9 above
116 \DeclareTextSymbolDefault{\textyen}{TS1}
117 \DeclareTextSymbolDefault{\textcapitalcompwordmark}{TS1}
118 \DeclareTextSymbolDefault{\textascendercompwordmark}{TS1}

```

In the following sections the remaining default definitions are ordered by sub-encoding in which they are become **unavailable**, i.e., they are not provided in the sub-encoding with that number and all sub-encodings with higher numbers.

Thus the symbols that are available in sub-encoding x are the symbols above (always available) and the symbols listed as becoming unavailable in sub-encodings $x + 1$ and higher.

1.1 Unavailable in sub-encoding 1 and higher (drop symbols not working in Latin Modern)

The `\textcircled` is available but the glyph is simply too small so we keep using the OMS glyph.

```
119 \DeclareTextCommandDefault{\textcircled}{  
120   {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OMS}}1\textcircled}}
```

1.2 Unavailable in sub-encoding 2 (majority of new OTF fonts via autoinst) and higher

```
121 \DeclareTextCommandDefault{\t}{  
122   {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OML}}2\t}}
```

Capital accents are really only very seldom implemented, so from sub-encoding 2 onwards we use the normal T1 accents if they are asked for in the document.

In Unicode engines we don't implement them at all but always use the basic accents instead. whether that works or not really depends on the font, something like `\"X` usually comes out wrong in Unicode engines.

```
123 \ifx\Umathcode\@undefined  
124   \DeclareTextCommandDefault{\capitalacute}{  
125     {\tc@check@accent{\'}2\capitalacute}  
126   \DeclareTextCommandDefault{\capitalbreve}{  
127     {\tc@check@accent{\u}2\capitalbreve}  
128   \DeclareTextCommandDefault{\capitalcaron}{  
129     {\tc@check@accent{\v}2\capitalcaron}  
130   \DeclareTextCommandDefault{\capitalcedilla}{  
131     {\tc@check@accent{\c}2\capitalcedilla}  
132   \DeclareTextCommandDefault{\capitalcircumflex}{  
133     {\tc@check@accent{\^}2\capitalcircumflex}  
134   \DeclareTextCommandDefault{\capitaldieresis}{  
135     {\tc@check@accent{\")2\capitaldieresis}  
136   \DeclareTextCommandDefault{\capitaldotaccent}{  
137     {\tc@check@accent{\.}2\capitaldotaccent}  
138   \DeclareTextCommandDefault{\capitalgrave}{  
139     {\tc@check@accent{\`}2\capitalgrave}  
140   \DeclareTextCommandDefault{\capitalhungarumlaut}{  
141     {\tc@check@accent{\H}2\capitalhungarumlaut}  
142   \DeclareTextCommandDefault{\capitalmacron}{  
143     {\tc@check@accent{\=}2\capitalmacron}  
144   \DeclareTextCommandDefault{\capitalogonek}{  
145     {\tc@check@accent{\k}2\capitalogonek}  
146   \DeclareTextCommandDefault{\capitalring}{  
147     {\tc@check@accent{\r}2\capitalring}  
148   \DeclareTextCommandDefault{\capitaltie}{  
149     {\tc@check@accent{\t}2\capitaltie}  
150   \DeclareTextCommandDefault{\capitaltilde}{  
151     {\tc@check@accent{\~}2\capitaltilde}}
```

For `\newtie` and `\capitalnewtie` this is actually wrong, they should pick up the accent from the substitution font (not done yet).

```
152 \DeclareTextCommandDefault{\newtie}{  
153   {\tc@check@accent{\t}2\newtie}  
154 \DeclareTextCommandDefault{\capitalnewtie}{
```

```
155          {\t\c@check@accent{\t}2\capitalnewtie}
```

In Unicode engines we just execute the simple accents:

```
156 \else
157   \DeclareTextCommandDefault{\capitalacute{@tabacckludge}}
158   \DeclareTextCommandDefault{\capitalbreve{u}}
159   \DeclareTextCommandDefault{\capitalcaron{v}}
160   \DeclareTextCommandDefault{\capitalcedilla{c}}
161   \DeclareTextCommandDefault{\capitalcircumflex{\^}}
162   \DeclareTextCommandDefault{\capitaldieresis{"}}
163   \DeclareTextCommandDefault{\capitaldotaccent{.}}
164   \DeclareTextCommandDefault{\capitalgrave{@tabacckludge}}
165   \DeclareTextCommandDefault{\capitalhungarumlaut{H}}
166   \DeclareTextCommandDefault{\capitalmacron{@tabacckludge=}}
167   \DeclareTextCommandDefault{\capitalnewtie{\t}}
168   \DeclareTextCommandDefault{\capitalogonek{k}}
169   \DeclareTextCommandDefault{\capitalring{r}}
170   \DeclareTextCommandDefault{\capitaltie{t}}
171   \DeclareTextCommandDefault{\capitaltilde{\~}}
172   \DeclareTextCommandDefault{\newtie{\t}}
173 \fi
```

The next two symbols exist in some fonts (faked?), but we ignore that to keep the subsets reasonable compact and most important linear.

```
174 \DeclareTextCommandDefault{\textlbrackdbl}
175           {\t\c@check@symbol2\textlbrackdbl}
176 \DeclareTextCommandDefault{\textrbrackdbl}
177           {\t\c@check@symbol2\textrbrackdbl}
```

Old style numerals are again in some fonts but using -OsF, etc. is the better approach to get them, so we claim they aren't in sub-encoding 2 as that's true for most fonts.

```
178 \DeclareTextCommandDefault{\texteightoldstyle}
179           {\t\c@check@symbol2\texteightoldstyle}
180 \DeclareTextCommandDefault{\textfiveoldstyle}
181           {\t\c@check@symbol2\textfiveoldstyle}
182 \DeclareTextCommandDefault{\textfouroldstyle}
183           {\t\c@check@symbol2\textfouroldstyle}
184 \DeclareTextCommandDefault{\textnineoldstyle}
185           {\t\c@check@symbol2\textnineoldstyle}
186 \DeclareTextCommandDefault{\textoneoldstyle}
187           {\t\c@check@symbol2\textoneoldstyle}
188 \DeclareTextCommandDefault{\textsevenoldstyle}
189           {\t\c@check@symbol2\textsevenoldstyle}
190 \DeclareTextCommandDefault{\textsixoldstyle}
191           {\t\c@check@symbol2\textsixoldstyle}
192 \DeclareTextCommandDefault{\textthreeoldstyle}
193           {\t\c@check@symbol2\textthreeoldstyle}
194 \DeclareTextCommandDefault{\texttwooldstyle}
195           {\t\c@check@symbol2\texttwooldstyle}
196 \DeclareTextCommandDefault{\textzerooldstyle}
197           {\t\c@check@symbol2\textzerooldstyle}
```

The next set of glyphs is special to TeX fonts (and available with a few older PS fonts supported through virtual fonts), but not any longer in the majority of fonts provided through autoinst, so we pretend there aren't available in sub-encoding 2 and below.

```
198 \DeclareTextCommandDefault{\textacutedbl}
```

```

199          {\tc@check@symbol2{textacutedbl}}
200 \DeclareTextCommandDefault{\textasciiacute}
201          {\tc@check@symbol2{textasciacute}}
202 \DeclareTextCommandDefault{\textasciibreve}
203          {\tc@check@symbol2{textasciibreve}}
204 \DeclareTextCommandDefault{\textasciicaron}
205          {\tc@check@symbol2{textasciicaron}}
206 \DeclareTextCommandDefault{\textasciidieresis}
207          {\tc@check@symbol2{textasciidieresis}}
208 \DeclareTextCommandDefault{\textasciigrave}
209          {\tc@check@symbol2{textasciigrave}}
210 \DeclareTextCommandDefault{\textasciimacron}
211          {\tc@check@symbol2{textasciimacron}}
212 \DeclareTextCommandDefault{\textgravedbl}
213          {\tc@check@symbol2{textgravedbl}}
214 \DeclareTextCommandDefault{\texttildelow}
215          {\tc@check@symbol2{texttildelow}}

```

Finally those below are only available in CM-based fonts but in no font that has its origin outside of the TeX world.

```

216 \DeclareTextCommandDefault{\textbaht}
217          {\tc@check@symbol2{textbaht}}
218 \DeclareTextCommandDefault{\textbigcircle}
219          {\tc@check@symbol2{textbigcircle}}
220 \DeclareTextCommandDefault{\textborn}
221          {\tc@check@symbol2{textborn}}
222 \DeclareTextCommandDefault{\textcentoldstyle}
223          {\tc@check@symbol2{textcentoldstyle}}
224 \DeclareTextCommandDefault{\textcircledP}
225          {\tc@check@symbol2{textcircledP}}
226 \DeclareTextCommandDefault{\textcopyleft}
227          {\tc@check@symbol2{textcopyleft}}
228 \DeclareTextCommandDefault{\textdblhyphenchar}
229          {\tc@check@symbol2{textdblhyphenchar}}
230 \DeclareTextCommandDefault{\textdblhyphen}
231          {\tc@check@symbol2{textdblhyphen}}
232 \DeclareTextCommandDefault{\textdied}
233          {\tc@check@symbol2{textdied}}
234 \DeclareTextCommandDefault{\textdiscount}
235          {\tc@check@symbol2{textdiscount}}
236 \DeclareTextCommandDefault{\textdivorced}
237          {\tc@check@symbol2{textdivorced}}
238 \DeclareTextCommandDefault{\textdollaroldstyle}
239          {\tc@check@symbol2{textdollaroldstyle}}
240 \DeclareTextCommandDefault{\textguarani}
241          {\tc@check@symbol2{textguarani}}
242 \DeclareTextCommandDefault{\textleaf}
243          {\tc@check@symbol2{textleaf}}
244 \DeclareTextCommandDefault{\textlquill}
245          {\tc@check@symbol2{textlquill}}
246 \DeclareTextCommandDefault{\textmarried}
247          {\tc@check@symbol2{textmarried}}
248 \DeclareTextCommandDefault{\textmho}
249          {\tc@check@symbol2{textmho}}
250 \DeclareTextCommandDefault{\textmusicalnote}

```

```

251           {\tc@check@symbol2{textmusicalnote}}
252 \DeclareTextCommandDefault{\textnaira}
253           {\tc@check@symbol2{textnaira}}
254 \DeclareTextCommandDefault{\textopenbullet}
255           {\tc@check@symbol2{textopenbullet}}
256 \DeclareTextCommandDefault{\textpeso}

```

The `\textpertenthousand` also belongs in this group but here we have a choice: in T1 there is a definition for `\textpertenthousand` making the symbol up from % and `\char 24` (twice) but in many fonts that char doesn't exist and the slot is reused for random ligatures. So better not use it because often it is wrong. But pointing to TS1 is also not great as only a few fonts have it as a real symbol, so we get a substitution to CM or LM.

Alternatively we could just state that the symbol is unavailable in those fonts. For now I substitute.

```

270 \DeclareTextCommandDefault{\textpertenthousand}
271           {\tc@check@symbol2{textpertenthousand}}
272 \UndeclareTextCommand{\textpertenthousand}{T1}

```

1.3 Unavailable in sub-encoding 3 and higher

Sub-encoding 2 is the one where we loose many symbols. In the higher-numbered sub-encodings we see only a few dropped additionally.

```

273 \DeclareTextCommandDefault{\textlangle}
274           {\tc@check@symbol3{textlangle}}
275 \DeclareTextCommandDefault{\textrangle}
276           {\tc@check@symbol3{textrangle}}

```

1.4 Unavailable in sub-encoding 4 and higher

```

277 \DeclareTextCommandDefault{\textcolonmonetary}

290          {\tc@check@symbol4\textuparrow}
291 \DeclareTextCommandDefault{\texttwo}{\tc@check@symbol4\texttwo}
292          {\tc@check@symbol4\texttwo}

```

1.5 Unavailable in sub-encoding 5 (most older PS fonts) and higher

Most older PS fonts (supported in TeX since the early nineties when virtual fonts became available) are sorted under this sub-encoding. But in reality, many of them don't have all glyphs that should be available in sub-encoding 5. Instead they show little squares, i.e., they produce “tofu” if you are unlucky.

But the coverage is so random that it is impossible to sort them properly and if we tried to ensure that they only typeset those glyphs that are really always available, we would have to put them all into sub-encoding 9; so putting them into 5 is really a compromise.

Modern fonts usually don't typeset a tofu character if a glyph is missing. They are therefore only classified as sub-encoding 5 if they really support its glyph set completely.

```

330 \tcc@check@symbol{9}\textbardbl}
```

2 Unicode engine specials

If we are using a unicode engine we handle some glyphs differently, so this here are the definitions for the Unicode encoding (overwriting the defaults above).

```
331 \ifx \Umathcode\@undefined \else
```

This set should be taken from TS1 encoding even if it means you get it from the default font for that encoding.

```
332 \% \DeclareTextSymbol{\textcopyleft}{TS1}{171}
333 \% \DeclareTextSymbol{\textdblyhyphen}{TS1}{45}
334 \% \DeclareTextSymbol{\textdblyhyphenchar}{TS1}{127}
335 \% \DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
336 \% \DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
337 \% \DeclareTextSymbol{\textleaf}{TS1}{108}
338 \% \DeclareTextSymbol{\texttwelveudash}{TS1}{21}
339 \% \DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}
```

If oldstyle numerals are asked for we just use \oldstylenums.

```
340 \DeclareTextCommand{\textzerooldstyle} \UnicodeEncodingName{\oldstylenums{0}}
341 \DeclareTextCommand{\textoneoldstyle} \UnicodeEncodingName{\oldstylenums{1}}
342 \DeclareTextCommand{\texttwooldstyle} \UnicodeEncodingName{\oldstylenums{2}}
343 \DeclareTextCommand{\textthreeoldstyle} \UnicodeEncodingName{\oldstylenums{3}}
344 \DeclareTextCommand{\textfouroldstyle} \UnicodeEncodingName{\oldstylenums{4}}
345 \DeclareTextCommand{\textfiveoldstyle} \UnicodeEncodingName{\oldstylenums{5}}
346 \DeclareTextCommand{\textsixoldstyle} \UnicodeEncodingName{\oldstylenums{6}}
347 \DeclareTextCommand{\textsevenoldstyle} \UnicodeEncodingName{\oldstylenums{7}}
348 \DeclareTextCommand{\texteightoldstyle} \UnicodeEncodingName{\oldstylenums{8}}
349 \DeclareTextCommand{\textnineoldstyle} \UnicodeEncodingName{\oldstylenums{9}}
```

These have Unicode slots so this should be integrated into TU explicitly

```
350 \DeclareTextSymbol{\textpilcrow} \UnicodeEncodingName{"00B6}
351 \DeclareTextSymbol{\textborn} \UnicodeEncodingName{"002A}
352 \DeclareTextSymbol{\textdied} \UnicodeEncodingName{"2020}
353 \DeclareTextSymbol{\textlbrackdbl} \UnicodeEncodingName{"27E6}
354 \DeclareTextSymbol{\textrbrackdbl} \UnicodeEncodingName{"27E7}
355 \DeclareTextSymbol{\textguarani} \UnicodeEncodingName{"20B2}
```

We could make `\textcentoldstyle` and `\textdollaroldstyle` point to dollar and cent in the Unicode encoding

```
356 \%DeclsTextSymbol{\textcentoldstyle} \UnicodeEncodingName{"00A2}
357 \%DeclsTextSymbol{\textdollaroldstyle}\UnicodeEncodingName{"0024}
```

but I think it is better to pick them up from TS1 even if that usually means LMR fonts

```
358 \DeclsTextSymbol{\textdollaroldstyle}{TS1}{138}
359 \DeclsTextSymbol{\textcentoldstyle} {TS1}{139}
360 \fi % --- END of Unicode engines specials
```

3 Font family sub-encodings setup

We declare the subsets for a good number of fonts in the kernel ...

But first the default for anything that is not declared. We use 9 which is most likely much too conservative, but with the advantage that we aren't getting missing glyphs (or at least that this is very unlikely). For nearly all font in the TeX Live distribution of 2019 "correct" classifications are given below, so that this default is only used for new font families, and over time the right classifications can be added here too.

```
361 \DeclsEncodingSubset{TS1}{?}{9}
```

This first block contains the fonts that have been already supported by the `textcomp` package way back, i.e., the font families that have TeX support since the mid-nineties.

```
362 \DeclsEncodingSubset{TS1}{ccr} {0}
363 \DeclsEncodingSubset{TS1}{cmbr} {0}
```

The following 4 declarations are now part of the corresponding .fd file, hopefully other will follow so that this list of declarations can eventually be removed from the kernel (where it doesn't belong).

```
364 \%DeclsEncodingSubset{TS1}{cmr} {0}
365 \%DeclsEncodingSubset{TS1}{cmss} {0}
366 \%DeclsEncodingSubset{TS1}{cmtt} {0}
367 \%DeclsEncodingSubset{TS1}{cmvtt} {0}
368 \DeclsEncodingSubset{TS1}{cmtl} {0}
369 \DeclsEncodingSubset{TS1}{pxr} {0}
370 \DeclsEncodingSubset{TS1}{pxss} {0}
371 \DeclsEncodingSubset{TS1}{pxtt} {0}
372 \DeclsEncodingSubset{TS1}{qag} {0}
373 \DeclsEncodingSubset{TS1}{qbk} {0}
374 \DeclsEncodingSubset{TS1}{qcr} {0}
375 \DeclsEncodingSubset{TS1}{qcs} {0}
376 \DeclsEncodingSubset{TS1}{qhvc} {0}
377 \DeclsEncodingSubset{TS1}{qhv} {0}
378 \DeclsEncodingSubset{TS1}{qpl} {0}
379 \DeclsEncodingSubset{TS1}{qtm} {0}
380 \DeclsEncodingSubset{TS1}{qzc} {0}
381 \DeclsEncodingSubset{TS1}{txr} {0}
382 \DeclsEncodingSubset{TS1}{txss} {0}
383 \DeclsEncodingSubset{TS1}{txtt} {0}
384 \DeclsEncodingSubset{TS1}{lmr} {1}
385 \DeclsEncodingSubset{TS1}{lmdh} {1}
386 \DeclsEncodingSubset{TS1}{lmss} {1}
387 \DeclsEncodingSubset{TS1}{lmssq} {1}
```

```
388 \DeclareEncodingSubset{TS1}{lmvtt} {1}
```

The lmtt family is missing TM, SM, and perthousand for some reason, so the first safe sub-encoding would be 2, but that is then missing out a huge number of glyphs that are available, so we claim it is sub-encoding 1 even if this can lead to missing glyphs.

```
389 \DeclareEncodingSubset{TS1}{lmtt} {1} % missing TM, SM and pertenthousand
```

The next three families have been removed from TeX Live, but we keep the definitions

```
390 \DeclareEncodingSubset{TS1}{ptmx} {2}
```

```
391 \DeclareEncodingSubset{TS1}{ptmj} {2}
```

```
392 \DeclareEncodingSubset{TS1}{u18} {2}
```

The next set are the early PostScript font implementations, these days there are better alternatives, but Note that, their virtual fonts contain a lot of “tofu” in form of black squares, thus they don’t even give a missing character warning if you select such a glyph. This is why they are set as sub-encoding 5.

```
393 \DeclareEncodingSubset{TS1}{bch} {5} % tofu for blank, ohm
```

```
394 \DeclareEncodingSubset{TS1}{futj} {5} % tofu for blank, interrobang/down, ohm
```

```
395 \DeclareEncodingSubset{TS1}{futs} {5} % tofu for blank, ohm
```

```
396 \DeclareEncodingSubset{TS1}{futx} {5} % probably (currently broken distrib)
```

```
397 \DeclareEncodingSubset{TS1}{pag} {5} % tofu for blank, interrobang/down, ohm
```

```
398 \DeclareEncodingSubset{TS1}{pbk} {5} % tofu for blank, interrobang/down, ohm
```

```
399 \DeclareEncodingSubset{TS1}{pcr} {5} % tofu for blank, interrobang/down, ohm
```

```
400 \DeclareEncodingSubset{TS1}{phv} {5} % tofu for blank, interrobang/down, ohm
```

```
401 \DeclareEncodingSubset{TS1}{pnc} {5} % tofu for blank, interrobang/down, ohm
```

```
402 \DeclareEncodingSubset{TS1}{pplj} {5} % tofu for blank
```

```
403 \DeclareEncodingSubset{TS1}{pplx} {5} % tofu for blank
```

```
404 \DeclareEncodingSubset{TS1}{ppl} {5} % tofu for blank interrobang/down
```

```
405 \DeclareEncodingSubset{TS1}{ptm} {5} % tofu for blank, interrobang/down, ohm
```

```
406 \DeclareEncodingSubset{TS1}{pzc} {5} % tofu for blank, interrobang/down, ohm
```

```
407 \DeclareEncodingSubset{TS1}{u19} {5} % tofu for blank, interrobang/down, ohm
```

The next set suffers from the same problem and they contain even fewer real glyphs.

```
408 \DeclareEncodingSubset{TS1}{dayroms} {6} % tofu for blank, interrobang/down, ohm
```

```
409 \DeclareEncodingSubset{TS1}{dayrom} {6} % tofu for blank, interrobang/down, ohm
```

```
410 \DeclareEncodingSubset{TS1}{augie} {8} % really only missing euro
```

```
411 \DeclareEncodingSubset{TS1}{put} {8}
```

```
412 \DeclareEncodingSubset{TS1}{uag} {8} % probably (currently broken distrib)
```

```
413 \DeclareEncodingSubset{TS1}{ugq} {8}
```

```
414 \DeclareEncodingSubset{TS1}{zi4} {9}
```

LucidaBright (sold through TUG) probably not quite correct, I guess as I have the older fonts ...

```
415 \DeclareEncodingSubset{TS1}{hls} {5}
```

```
416 \DeclareEncodingSubset{TS1}{hlst} {5}
```

```
417 \DeclareEncodingSubset{TS1}{hlct} {5}
```

```
418 \DeclareEncodingSubset{TS1}{hlh} {5}
```

```
419 \DeclareEncodingSubset{TS1}{hlx} {8}
```

```
420 \DeclareEncodingSubset{TS1}{hlce} {8}
```

```
421 \DeclareEncodingSubset{TS1}{hlcn} {8}
```

```
422 \DeclareEncodingSubset{TS1}{hlcw} {8}
```

```
423 \DeclareEncodingSubset{TS1}{hlcf} {8}
```

Below are the newer fonts that have support files for L^AT_EX. With very few exceptions the classifications are done so that all characters are correctly produced (either being available in the font or substituted).

There are a few fonts that contain “tofu” squares in places (instead of a real glyph) and in a few cases some really seldom needed chars are unavailable, i.e., produce missing glyphs (to avoid that a large number of available chars are unnecessarily substituted).

Encoding declarations for these font families shouldn’t really be in the kernel, but part of the .fd files for the family. When we introduced the concept in 2021 we had some hope that this would happen over time and that we could take the declarations out—after all it is nearly impossible to maintain it correctly in the kernel, given that fonts may get new glyphs added (happened for several of them in the recent year) which is something we wouldn’t notice. However, so far this hasn’t happened, so in 2024, I went through the current set and adjusted the declarations in several places.

Next four are wrong and still need adjustment:

```

424 \DeclareEncodingSubset{TS1}{lato-*}      {0} % with a bunch of tofu inside
425 \DeclareEncodingSubset{TS1}{opensans-*}    {0} % with a bunch of tofu inside
426 \DeclareEncodingSubset{TS1}{cantarell-*}   {0} % with a bunch of tofu inside
427 \DeclareEncodingSubset{TS1}{tli}          {1} % with lots of tofu inside
428 \DeclareEncodingSubset{TS1}{fbb-*}         {2} % missing centoldstyle
429 \DeclareEncodingSubset{TS1}{Alegreya-*}     {2}
430 \DeclareEncodingSubset{TS1}{AlegreyaSans-*} {2}
431 \DeclareEncodingSubset{TS1}{BaskervilleF-*} {2}
432 \DeclareEncodingSubset{TS1}{DejaVuSans-TLF} {2}
433 \DeclareEncodingSubset{TS1}{DejaVuSansCondensed-TLF} {2}

```

Next one is missing \textfractionsolidus but is otherwise completely sub-encoding 2 so we use that sub-encoding.

```

434 \DeclareEncodingSubset{TS1}{DejaVuSansMono-TLF}      {2}
435 \DeclareEncodingSubset{TS1}{EBGaramond-*}             {2}

5 The `textcomp` package

For any rollback request before 2018-08-11 we make an attempt by loading the 2018 version.

```

774 〈*TS1sty〉
775 \DeclareRelease{}{1997-12-01}{textcomp-2018-08-11.sty}
776 \DeclareRelease{}{2018-08-11}{textcomp-2018-08-11.sty}
777 \DeclareCurrentRelease{}{2020-02-02}
778
779 \ProvidesPackage{textcomp}
780 [2024/04/24 v2.1b Standard LaTeX package]
A precaution in case this is used without rebuilding the format.
781 \NeedsTeXFormat{LaTeXe}[2020/02/02]
This is implemented by defining the default subset:
782 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
783 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
784 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{8}}
785 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{9}}

```

The default is set up in the kernel is “safe” these days for unknown fonts but LaTeX has definitions for most families so it seldom applies.

If a different default is used then one needs to check the results to ensure that there aren’t “missing glyphs”.

The next set of options define the warning level (default in the kernel is info only). Using the package options you can change this behavior.

```

786 \DeclareOption{error}
787     {\gdef\tc@errorwarn{\PackageError{textcomp}}}
788 \DeclareOption{warn}
789     {\gdef\tc@errorwarn#1#2{\PackageWarning{textcomp}{#1}}}
790 \DeclareOption{info}
791     {\gdef\tc@errorwarn#1#2{\PackageInfo{textcomp}{#1}}}
792 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2{}}

```

The “force” option basically changes the sub-encoding to that of the default (which, unless changes, is 9 these days), i.e., it no longer depends on the font in use. This is mainly there because it might have been used in older documents, but not something that is recommended.

```

793 \DeclareOption{force}{%
794   \def\CheckEncodingSubset#1#2#3#4#5{%
795     \ifnum #4>%
796       0\csname #2:?\endcsname
797       \relax
798       \expandafter\@firstoftwo
799     \else
800       \expandafter\@secondoftwo
801     \fi
802     {#1{#2}}{#3}%
803     #5}%
804 }
805 \ProcessOptions\relax

```

There is not much else to do nowadays, because everything is already set up in the L^AT_EX kernel.

```

806 \InputIfFileExists{textcomp.cfg}
807   {\PackageInfo{textcomp}{Local configuration file used}}{}%
808 </TS1sty>

```

5.1 The old textcomp package code

This section contains the old code for the textcomp package and its documentation. It is only used if we roll back prior to 2020. Thus all the rest is mainly for historians. Note that the old code categorized in the sub-encodings only into 6 classes not 10.

```

809 <*TS1oldsty>
810 \ProvidesPackage{textcomp}
811   [2018/08/11 v2.0j Standard LATEX package]

```

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

#5 those TS1 symbols that are also in the ISO-Adobe character set; without `\textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non-T_EX world provide only this subset.

#4 = #5 + `\texteuro`. Most newer fonts provide this.

#3 = #4 + `\textomega`. Can also be described as $TS1 \cap (ISO\text{-}Adobe \cup MacRoman)$. (Except for the missing "currency".)

#2 = #3 + \textestimated + \textcurrency. Can also be described as TS1 ∩ Adobe-Western-2. This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

#1 = TS1 without \textcircled and \t. These two glyphs are often not implemented and if their kernel defaults are changed commands like \copyright unnecessarily fail.

#0 = full TS1

And here a summary to go in the transcript file:

```
812 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
813   \space\space 5 = only ISO-Adobe without
814     \string\textcurrency\MessageBreak
815   \space\space 4 = 5 + \string\texteuro\MessageBreak
816   \space\space 3 = 4 + \string\textohm\MessageBreak
817   \space\space 2 = 3 + \noexpand\textestimated+
818     \string\textcurrency\MessageBreak
819   \space\space 1 = TS1 - \noexpand\textcircled-
820     \string\t\MessageBreak
821   \space\space 0 = TS1 (full)\MessageBreak
822 Font families with sub-encoding setting implement\MessageBreak
823 only a restricted character set as indicated.\MessageBreak
824 Family '?' is the default used for unknown fonts.\MessageBreak
825 See the documentation for details\@gobble}
```

\DeclareEncodingSubset An encoding subset to which a font family belongs is declared by the command **\DeclareEncodingSubset** that takes the major encoding as the first argument (e.g., TS1), the family name as the second argument (e.g., **cmt**), and the subset encoding id as a third, (e.g., 0 for **cmt**).

The default encoding subset to use when nothing is known about the current font family is named ?.

```
826 \def\DeclareEncodingSubset#1#2#3{%
827   \@ifundefined{#1:#2}{%
828     {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
829     {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
830   }@\namedef{#1:#2}{#3}}
```

In the original code this was only allowed in the preamble but now .fds might contain it so that even in a rollback situation it is necessary to allow it everywhere in the document.

```
831 %\onlypreamble\DeclareEncodingSubset
```

(End of definition for **\DeclareEncodingSubset**.)

The options for the package are the following:

safe for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

euro enables the "safe" symbols plus the \texteuro command. Most newer fonts provide this.

full enables all TS1 commands; useful only with fonts like EC or CM bright.

almostfull same as “full”, except that `\textcircled` and `\t` are *not* redefined from their defaults to avoid that commands like `\copyright` suddenly no longer work.

force ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

`\iftc@forced` Switch used to implement the **force** option
832 `\newif\iftc@forced \tc@forcedfalse`

(End of definition for `\iftc@forced`.)

This is implemented by defining the default subset:

833 `\DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}`
834 `\DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}`
835 `\DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}`
836 `\DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}`

The default is “almostfull” which means that old documents will work except that `\textcircled` and `\t` will use the kernel defaults (with the advantage that this also works if the current font, as often the case, doesn’t implement these glyphs).

The “force” option simply sets the switch to true.

837 `\DeclareOption{force}{\tc@forcedtrue}`

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

838 `\def\tc@errorwarn{\PackageError}`
839 `\DeclareOption{warn}{\gdef\tc@errorwarn#1#2#3{\PackageWarning{#1}{#2}}}`
840 `\DeclareOption{quiet}{\gdef\tc@errorwarn#1#2#3{}}`
841 `\ExecuteOptions{almostfull}`
842 `\ProcessOptions\relax`

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: `#2` and `#5` of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs `#3#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

843 `\iftc@forced`

If the “force” option was given we always use the default for testing against.

844 `\def\CheckEncodingSubset#1#2#3#4#5{%`
845 `\ifnum #4>%`
846 `0\csname #2:?\endcsname`
847 `\relax`
848 `\expandafter\@firstoftwo`
849 `\else`

```

850      \expandafter\@secondoftwo
851      \fi
852      {#1{#2}}{#3}%
853      #5%
854 }

```

In normal circumstances the test is a bit more complicated: first check if there exists a macro `\⟨arg2⟩:⟨current-family⟩` and if so use that value to test against, otherwise use the default to test against.

```

855 \else
856 \def\CheckEncodingSubset#1#2#3#4#5{%
857   \ifnum #4>%
858     \expandafter\ifx\csname #2:\f@family\endcsname\relax
859       \csname #2:?\endcsname
860     \else
861       \csname #2:\f@family\endcsname
862     \fi
863   \relax
864   \expandafter\@firstoftwo
865   \else
866     \expandafter\@secondoftwo
867   \fi
868   {#1{#2}}{#3}%
869   #5%
870 }
871 \fi

```

(End of definition for `\CheckEncodingSubset`.)

```

\tc@subst
872 \def\tc@subst#1{%
873   \tc@errorwarn{textcomp}%
874   {Symbol \string#1 not provided by\MessageBreak
875    font family \f@family\space
876    in TS1 encoding.\MessageBreak Default family used instead}\@eha
877 \bgroup\fontfamily{textcompsubstddefault}\selectfont#1\egroup
878 }

```

(End of definition for `\tc@subst`.)

`\tc@error` `\tc@error` is going to be used in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

```

879 % error commands take argument:
880 % #1 symbol to be used
881 \def\tc@error#1{%
882   \PackageError{textcomp}{% should be latex error if general
883   {Accent \string#1 not provided by\MessageBreak
884    font family \f@family\space
885    in TS1 encoding}\@eha
886 }

```

(End of definition for `\tc@error`.)

\tc@fake@euro \tc@fake@euro is an example of a “fake” definition to use in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a “C” with a “=”.

```

887 \def\tc@fake@euro#1{%
888   \leavevmode
889   \PackageInfo{textcomp}{Faking \noexpand#1 for font family
890           \f@family\MessageBreak in TS1 encoding}%
891   \valign{##\cr
892     \vfil\hbox to 0.07em{\dimen@\f@size\p@
893           \math@fontsfalse
894           \fontsize{.7\dimen@}\z@\selectfont=\hss}%
895     \vfil\cr%
896     \hbox{C}\crcr
897   }%
898 }
```

(End of definition for \tc@fake@euro.)

\tc@check@symbol \tc@check@accent These are two abbreviations that we use below to check symbols and accents in TS1. Only there to save some space, e.g., we can then write

```
DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}
```

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurrency is not available.

```

899 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
900 \def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
```

(End of definition for \tc@check@symbol and \tc@check@accent.)

We start with the commands that are “safe” and which can be unconditionally set up, first the accents...

```

901 \DeclareTextAccentDefault{\capitalcedilla}{TS1}
902 \DeclareTextAccentDefault{\capitalogonek}{TS1}
903 \DeclareTextAccentDefault{\capitalgrave}{TS1}
904 \DeclareTextAccentDefault{\capitalacute}{TS1}

1080  \DeclareTextCommandDefault{\textreferencemark}{%
1081      {\tc@check@symbol2{textreferencemark}}
1082  \DeclareTextCommandDefault{\textsurd}{%
1083      {\tc@check@symbol2{textsurd}}

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1084 \DeclareTextCommandDefault{\textcircled}{%
1085     {\CheckEncodingSubset\UseTextAccent{TS1}}%
1086     {\UseTextAccent{OMS}}1\textcircled}
1087 \DeclareTextCommandDefault{\t}{%
1088     {\CheckEncodingSubset\UseTextAccent{TS1}}%
1089     {\UseTextAccent{OML}}1\t}

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimized for this encoding (and not for the default encoding).

```
1090 \input{ts1enc.def}
```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L^AT_EX which will prevent the usage of the TS1 versions. So we better get rid of them:

```

1091 \UndeclareTextCommand{\textsterling}{OT1}
1092 \UndeclareTextCommand{\textdollar} {OT1}

```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```

1093 %\UndeclareTextCommand{\textsterling}{OT4}
1094 %\UndeclareTextCommand{\textdollar} {OT4}

```

From the T1 encoding there are two candidates for removal: `%o` and `%oo` since these are both constructed from `%` followed by a tiny ‘`o`’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in `%■` rather than `%o` while the real glyph (at least for `\textperthousand`) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for `\textperthousand` but keeping the one for `\textpertenthousand`. This will have the effect that with Computer Modern fonts everything will come out (although `%o` and `%oo` are not taken from the same physical font) and with PostScript fonts `%o` will come out correctly while `%oo` will most likely look like `%■` — which is probably an improvement over just getting a single ‘`■`’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ `\textpertenthousand`.

```

1095 \UndeclareTextCommand{\textperthousand}{T1}
1096 %\UndeclareTextCommand{\textpertenthousand}{T1}

```

5.1.1 Supporting oldstyle digits

```
1097 \DeclareRobustCommand{\oldstyleenums}[1]{%
1098   \begingroup
1099   \ifmmode
1100     \mathgroup\symletters #1%
1101   \else
1102     \CheckEncodingSubset{\use@text@encoding{TS1}}%
1103     {\PackageWarning{textcomp}{%
1104       Oldstyle digits unavailable for
1105       family \f@family.\MessageBreak
1106       Lining digits used instead}}%
1107     \tw@{\#1}%
1108   \fi
1109 \endgroup
1110 }
```

5.1.2 Subset encoding defaults

For many font families commonly used in the TeX world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```
1111 \iftc@forced \else
      Computer modern based fonts (e.g., CM, CM-Bright, Concrete):
1112 \DeclareEncodingSubset{TS1}{cmr}    {0}
1113 \DeclareEncodingSubset{TS1}{cmss}   {0}
1114 \DeclareEncodingSubset{TS1}{cmtt}   {0}
1115 \DeclareEncodingSubset{TS1}{cmvtt}  {0}
1116 \DeclareEncodingSubset{TS1}{cmbr}   {0}
1117 \DeclareEncodingSubset{TS1}{cmtl}   {0}
1118 \DeclareEncodingSubset{TS1}{ccr}    {0}

      PSNFSS fonts:
1119 \DeclareEncodingSubset{TS1}{ptm}    {4}
1120 \DeclareEncodingSubset{TS1}{pcr}    {4}
1121 \DeclareEncodingSubset{TS1}{phv}    {4}
1122 \DeclareEncodingSubset{TS1}{pp1}    {3}
1123 \DeclareEncodingSubset{TS1}{pag}    {4}
1124 \DeclareEncodingSubset{TS1}{pbk}    {4}
1125 \DeclareEncodingSubset{TS1}{pnc}    {4}
1126 \DeclareEncodingSubset{TS1}{pzc}    {4}
1127 \DeclareEncodingSubset{TS1}{bch}    {4}
1128 \DeclareEncodingSubset{TS1}{put}    {5}

      Other CTAN fonts (probably not complete):
1129 \DeclareEncodingSubset{TS1}{uag}    {5}
1130 \DeclareEncodingSubset{TS1}{ugq}    {5}
1131 \DeclareEncodingSubset{TS1}{ul8}    {4}
1132 \DeclareEncodingSubset{TS1}{ul9}    {4} % (LuxiSans, one day)
1133 \DeclareEncodingSubset{TS1}{augie}  {5}
1134 \DeclareEncodingSubset{TS1}{dayrom} {3}
1135 \DeclareEncodingSubset{TS1}{dayroms} {3}
1136 \DeclareEncodingSubset{TS1}{pxr}    {0}
```

```

1137 \DeclareEncodingSubset{TS1}{pxss} {0}
1138 \DeclareEncodingSubset{TS1}{pxtt} {0}
1139 \DeclareEncodingSubset{TS1}{txr} {0}
1140 \DeclareEncodingSubset{TS1}{txss} {0}
1141 \DeclareEncodingSubset{TS1}{txtt} {0}

```

Latin Modern and TeX Gyre:

```

1142 \DeclareEncodingSubset{TS1}{lmr} {0}
1143 \DeclareEncodingSubset{TS1}{lmdh} {0}
1144 \DeclareEncodingSubset{TS1}{lmss} {0}
1145 \DeclareEncodingSubset{TS1}{lmssq} {0}
1146 \DeclareEncodingSubset{TS1}{lmvtt} {0}
1147 \DeclareEncodingSubset{TS1}{lmitt} {0}
1148 \DeclareEncodingSubset{TS1}{qhv} {0}
1149 \DeclareEncodingSubset{TS1}{qag} {0}
1150 \DeclareEncodingSubset{TS1}{qbk} {0}
1151 \DeclareEncodingSubset{TS1}{qcr} {0}
1152 \DeclareEncodingSubset{TS1}{qcs} {0}
1153 \DeclareEncodingSubset{TS1}{qpl} {0}
1154 \DeclareEncodingSubset{TS1}{qtm} {0}
1155 \DeclareEncodingSubset{TS1}{qzc} {0}
1156 \DeclareEncodingSubset{TS1}{qhvc} {0}

```

Fourier-GUTenberg:

```

1157 \DeclareEncodingSubset{TS1}{futs} {4}
1158 \DeclareEncodingSubset{TS1}{futx} {4}
1159 \DeclareEncodingSubset{TS1}{futj} {4}

```

Y&Y's Lucida Bright

```

1160 \DeclareEncodingSubset{TS1}{hlh} {3}
1161 \DeclareEncodingSubset{TS1}{hls} {3}
1162 \DeclareEncodingSubset{TS1}{hlst} {3}

```

The remaining settings for Lucida are conservative: the following fonts contain the `\textohm` character but not the `\texteuro`, i.e., belong to neither subset 4 nor subset 3. If you want to use the `\textohm` with these fonts copy these definition to `textcomp.cfg` and change the subset to 3. However in that case make sure that you do not use the `\texteuro`.

```

1163 \DeclareEncodingSubset{TS1}{hlct} {5}
1164 \DeclareEncodingSubset{TS1}{hlx} {5}
1165 \DeclareEncodingSubset{TS1}{hlce} {5}
1166 \DeclareEncodingSubset{TS1}{hlcn} {5}
1167 \DeclareEncodingSubset{TS1}{hlcw} {5}
1168 \DeclareEncodingSubset{TS1}{hlcf} {5}

```

Other commercial families...

```

1169 \DeclareEncodingSubset{TS1}{pplx} {3}
1170 \DeclareEncodingSubset{TS1}{pplj} {3}
1171 \DeclareEncodingSubset{TS1}{ptmx} {4}
1172 \DeclareEncodingSubset{TS1}{ptmj} {4}

```

If the file `textcomp.cfg` exists it will be loaded at this point. This allows to define further subset encodings for font families not covered by default.

```

1173 \InputIfFileExists{textcomp.cfg}
1174   {\PackageInfo{textcomp}{Local configuration file used}}{}

```

```

1175 \fi
1176 
```

6 The `checkencodingsubset.tex` file

This is a simple file that asks for a name of a font family and then displays information about the TS1 encoding for this family and recommends the right encoding subset (to be used with `\DeclareEncodingSubset`) for this family.

```

1177 {*TS1check}
1178 \ProvidesFile{checkencodingsubset.tex}
1179 [2024/10/18 v0.5b Figure out safe TS1 encoding subsets]
1180 \let\typeoutdetails\typeout
1181 \%def\typeoutdetails#1{} % alternative definition used below

```

For the purpose of this check a glyph exists if the font slot is occupied—too bad if that contains the wrong glyph or some tofu. If it “exists” we return 0 otherwise 1. This way we can call this macro several times in a row and obtain a number that is 0 if all glyphs are existing or greater than 0 if any of them is missing.

The second argument (holding the command name for a symbol) is not used during these tests.

```
1182 \%def\doesglyphexist#1#2{\iffontchar\testFont #1 0\else 1\relax \fi}
```

This macro also tests and outputs some information about the symbol if it is missing. This time we make use of the second argument.

```

1183 \%def\glyphmissingdetails#1#2{\iffontchar\testFont #1 \else
1184   \typeoutdetails{\space\space\space ==> \string#2 (#1) is missing}\fi}
1185 \newif\ifsafesubencodingfound
1186 \newif\ifcoremisses

```

Testing a group of symbols that belong to one sub-encoding. More precisely, the symbols that become unavailable if you change from sub-encoding x (#2) to $x + 1$ (#3). As far as the code is concerned, the symbols that are supposed to be always available (the core) become available if we test the group -1 and 0.

The first argument contains the testing code and is supposed to return a single number greater or equal to zero.

```

1187 \%def\testgroup#1#2#3{%
1188   \ifnum 0 = #1%
1189     \ifnum #2<0
1190       \typeoutdetails{All glyphs in core exist}%
1191     \else
1192       \typeoutdetails{All glyphs between sub-encoding #2 and #3 exist}%
1193     \fi
1194   \else
1195     \ifnum #2<0
1196       \typeoutdetails{*****}%
1197       \typeoutdetails{Some glyphs are missing from core:}%
1198       \coremissestrue
1199       \ifsafesubencodingfound \else
1200         \def\subencodingresult{#2}%
1201       \fi
1202     \else

```

```

1203      \typeout{Some glyphs are missing from sub-encoding #2:}%
1204      \ifsafesubencodingfound \else
1205          \def\subencodingresult{\#3}%
1206      \fi
1207  \fi

```

If some glyphs are missing, we rerun the test code but this time using `\glyphmissingdetails`.

```

1208      {\let\doesglyphexist \glyphmissingdetails \#1}%

```

And because we had misses we have definitely found the subset.

```

1209      \safesubencodingfoundtrue
1210  \fi
1211 }

```

The currently defined subset for the family is either stored in `\TS1:<family>` if it was declared, or it is the default subset which is stored in `\TS1:?`.

```

1212 \def\currsubencoding#1{\csname TS1:\ifcsname TS1:#1\endcsname #1\else ?\fi\endcsname}

```

If a font family is not found when declaring it with `\DeclareFixedFont` we end up with the following font. This can then be used as a simple test if we failed loading the `TS1` font.

```

1213 \DeclareFixedFont\cmrFont{TS1}{cmr}{m}{n}{10pt}

```

Check for all glyphs in all encoding subsets ...

```

1214 \def\testallgroups#1{%
1215     \DeclareFixedFont\testFont{TS1}{#1}{m}{n}{10pt}%
1216     \ifx\testFont\cmrFont
1217         \typeout{***** Font family #1 not found *****}%
1218     \else

```

We haven't checked anything yet.

```

1219     \safesubencodingfoundfalse
1220     \coremissesfalse
1221     \typeout{-----}%
1222     \typeout{Testing font family #1-----}%
1223     \currsubencoding{#1}%
1224     \typeout{-----}%

```

Then we start testing the groups beginning with the glyphs between sub-encoding 8 and 9. If any of them is missing (checked with `\doesglyphexist`) then we already know that 9 is the correct answer.

```

1225 \testgroup{%
1226     \doesglyphexist{21}{\texttwelvedash}%

ltpageno.dtx

1 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering` The user sets the page number style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```
1  {*2ekernel}
2  \message{page nos.,}
3  \countdef\c@page=0 \c@page=1
4  \def\cl@page{}
5  \def\pagenumbering#1{%
6    \global\c@page \c@ne \gdef\thepage{\csname \#1\endcsname
7    \c@page}}
8  {/2ekernel}
```

File 35

ltxref.dtx

1 Cross Referencing

The user writes `\label{<foo>}` to define the following cross-references:

`\ref*<{<foo>}`: value of most recently incremented referenceable counter. in the current environment. (Chapter, section, theorem, footnote and enumeration counters and other counters stepped with `\refstepcounter` are referenceable.)

`\pageref*<{<foo>}`: page number at which `\label{foo}` command appeared. where foo can be any string of characters not containing ‘\’, ‘{’ or ‘}’.

Note: The scope of the `\label` command is delimited by environments, so
`\begin{theorem} \label{foo} ... \end{theorem} \label{bar}`
defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

Note: the starred versions `\ref*` and `\pageref*` are provided to align with the use of `hyperref`. Without `hyperref` (or some other package using the starred form) the star is simply ignored.

Note: starting with 2023-06-01 `\label` stores also the current value of `\@currentlabelname` which should typically contain a (sanitized) title. (A reference command `\nameref` is provided by the `nameref` package.) `\label` also stores `\@currentHref` which if set should refer to a target name for links. This value is set and used by `hyperref`. Unlike the other values `\@currentHref` should be set globally. A fifth value `\@kernel@reserved@label@data` is reserved for the kernel to allow future extensions of the cross-reference system.

1.1 Cross Referencing

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
1 <*2ekernel>
2 \message{x-ref,}
```

This is implemented as follows. A referenceable counter CNT is incremented by the command `\refstepcounter{CNT}`, which sets `\@currentlabel == {CNT}{eval(\p@cnt\theCNT)}`. The command `\label{FOO}` then writes the following on file `\auxout`:

```
\newlabel{FOO}{{eval(\@currentlabel)}{eval(\thepage)}%
```

```
{eval(\@currentlabelname)}{eval(\@currentHref)}{eval(\@kernel@reserved@label@data)}}

\ref{FOO} ==
BEGIN
  if \r@foo undefined
    then @refundefined := G T
    ??
  Warning: 'reference foo on page ... undefined'
```

```

        else  \@car \eval(\r@FOO)\@nil
    fi
END

\pageref{foo} =
BEGIN
if \r@foo undefined
then  @refundefined := G T
??
Warning: 'reference foo on page ... undefined'
else  \@cdr \eval(\r@FOO)\@nil
fi
END

```

End of historical L^AT_EX 2.09 comments.

\labelformat A reference via \ref produces by default the data associated with the corresponding \label command (typically a number); any additional formatting has to be provided by the user. If, for example, references to equations are always to be typeset as “equation (number)”, one has to code “equation (\ref{key})”. With \labelformat there is a possibility to generate such frills automatically without resorting to low-level coding. The command takes two arguments: the first is the name of a counter and the second is its representation when referenced. This means that for a successful usage, one has to know the counter name being used for generating the label, though in practice this should not pose a problem. The current counter number is picked up as an argument. Here are two examples:

```

\labelformat{section}{section~#1}
\labelformat{equation}{equation~(#1)}

```

\Ref A side effect of using \labelformat is that, depending on the defined formatting, it becomes impossible to use \ref at the beginning of a sentence (if its replacement text starts with a lowercase letter). To overcome this problem we introduce the command \Ref that behave like \ref except that it uppercases the first token of the generated string.

To make \Ref work properly the very first token in the second argument of \labelformat has to be a simple ASCII or UTF-8 letter, otherwise the capitalization will fail or worse, you will end up with some error messages. If you actually need something more complicated in this place (e.g., an accented letter not written as a UTF-8 character) you have to explicitly surround it with braces, to identify the part that needs to be capitalized. For example, for figure references in the Hungarian language you might want to write \labelformat{figure}{{'a}bra-\thefigure} or use \labelformat{figure}{\'abra-\thefigure} which avoids the brace problem.

\G@refundefinedtrue
\@refundefined This does not save on name-space (since \G@refundefinedfalse was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

Note despite its name, \G@refundefinedtrue does *not* correspond to an \if command, and there is no matching ... false. It would be more natural to call the command \G@refundefined (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a \ref-like command that mimicked the definition of \ref, calling \G@refundefinedtrue. Inspection of the TeX archives

revealed several such packages, and so this command has been named ...`true` so that the definition of `\ref` need not be changed, and the packages will work without change.

```

3  % \newif\ifG@refundefined
4  % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5  % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6  \def\G@refundefinedtrue{%
7    \gdef\@refundefined{%
8      @latex@warning@no@line{There were undefined references}}}
9  \let\@refundefined\relax

```

(End of definition for `\G@refundefinedtrue` and `\@refundefined`.)

```

As the commands are now protected we also need expandable versions for use in `\ifthenelse`:

```

70  \def\@kernel@pageref@exp#1{\csname cs_if_exist:cTF\endcsname
71    {r@#1}\{\csname tl_item:cn\endcsname{r@#1}{2}\}{0}\}
72  \def\@kernel@ref@exp#1{\csname cs_if_exist:cTF\endcsname
73    {r@#1}\{\csname tl_item:cn\endcsname{r@#1}{1}\}{0}\}
74  (/2ekernel | \begin{macro}{\@kernel}{\@release})
75  \EndIncludeInRelease
76  \IncludeInRelease{0000/00/00}%
77  \begin{macro}{\@ref}{Add starred reference commands}%
78  \def\@ref#1{\expandafter\@setref\csname r@#1\endcsname\@firstoftwo{#1}}
79  \def\@pageref#1{\expandafter\@setref\csname r@#1\endcsname
80    \secondoftwo{#1}}%
81  \begin{macro}{\@pageref}{\@ref}
82  \EndIncludeInRelease
83  (*2ekernel)

```

(End of definition for `\ref`, `\pageref`, and `\@setref`.)

\newlabel This command will be written to the `.aux` file to pass label information from one run to another.

\@newl@bel The internal form of `\newlabel` and `\bibcrite`. Note that this macro does it's work inside a group. That way the local assignments it needs to do don't clutter the save stack. This prevents large documents with many labels to run out of save stack.

```

84  \def\@newl@bel#1#2#3{%
85    \@ifundefined{#1#2}%
86      \relax
87      \gdef\@multiplelabels{%
88        \@latex@warning@no@line{There were multiply-defined labels}}%

```

```

89      \@latex@warning@no@line{Label '#2' multiply defined}%
90  \global\@namedef{\@newl@bel r}{}
91  \def\newlabel{\@newl@bel r}
92  \onlypreamble\@newl@bel

```

(End of definition for `\newlabel` and `\@newl@bel`.)

`\if@multiplelabels` This is redefined to produce a warning if at least one label is defined more than once. It is executed by the `\enddocument` command.

```
93  \let \@multiplelabels \relax
```

(End of definition for `\if@multiplelabels` and `\@multiplelabels`.)

`\label` The commands `\label` and `\refstepcounter` have been changed to allow `\protect`'ed commands to work properly. For example,

```
\def\thechapter{\protect\foo{\arabic{chapter}}.\roman{section}}
```

will cause a `\label{bar}` command to define `\ref{bar}` to expand to something like `\foo{4.d}`. Change made 20 Jul 88.

```

94  </2ekernel>

111 \def\ltx@star@counter{*}
```

(End of definition for `\refstepcounter`.)

`\refstepcounter` Step the counter and allow for labels to point to its current value.

```

112 <|latexrelease>\IncludeInRelease{2022/06/01}%
113 <|latexrelease>                                {\Ref}{Add starred version}%
114 \def\@currentcounter{}%
115 <|latexrelease>\EndIncludeInRelease
116 <|latexrelease>\IncludeInRelease{2024/11/01}%
117 <|latexrelease>                                {\currentHref}{set theHcounter representation}%

```

refstepcounter (*socket*) This socket takes the whole code as argument. The default kernel plug is identity. By changing the plug hyperref can add a conditional and e.g. suppress the processing in a PDF context.

```
118 \NewSocket{refstepcounter}{1}
```

refstepcounter/target (*socket*) This socket takes an argument, the counter name, and should at least set from it the target name `\@currentHref`. With hyperref it sets also the actual target. This is done with a socket so that the target name is not set more than once to (possibly) different names. The socket is not used in `\@kernel@refstepcounter`. The tagging code needs the target name so it is added after this socket.

```
119 \NewSocket{refstepcounter/target}{1}
```

(**refstepcounter/target**) (*plug*)

```
120 \NewSocketPlug{refstepcounter/target}{kernel}
121 {\xdef\@currentHref {\#1.\csname the#1\endcsname}}%
122 \AssignSocketPlug{refstepcounter/target}{kernel}

123 \def\refstepcounter#1{%
124   \UseSocket{refstepcounter}{%
125     \stepcounter{#1}%
126     \edef\reserved@a{\#1}%
127     \ifx\reserved@a\ltx@star@counter\else
128       \let\@currentcounter\reserved@a
129     \fi
130     \protected@edef\@currentlabel
```

By generating the second `\csname` first the `\p@...` command can grab it as an argument which can be helpful for more complicated typesetting arrangements.

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the....`. With the original kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

```
131   {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
132   \UseSocket{refstepcounter/target}{#1}%
133   \UseTaggingSocket{recordtarget}%
134 }%
135 }
```

This is a version of `\refstepcounter` which does not set and use targets.

```
\@kernel@refstepcounter \def\@kernel@refstepcounter#1{%
136   \UseSocket{refstepcounter}{%
137     \stepcounter{#1}%
138     \edef\reserved@a{\#1}%
139     \ifx\reserved@a\ltx@star@counter\else
140       \let\@currentcounter\reserved@a
141     \fi
142     \protected@edef\@currentlabel
143     {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}}%
```

```

149  \edef@\currentcounter{#1}%
150  \protected@edef@\currentlabel
151  {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
152  }
153  \let@\kernel@refstepcounter\refstepcounter
154  \end{macro}

(End of definition for \refstepcounter and \kernel@refstepcounter.)
```

155 \end{macro}

156 \def@\Ref{Add starred version}%

\labelformat A shortcut to set the `\p@...` macro for a counter. It will pick up the counter representation as an argument so that it can be specially formatted.

```
157 \def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}
```

(End of definition for \labelformat.)

\Ref This macro expands the result of `\ref` and then uppercases the first token. Only useful if the label was generated via `\labelformat` and contains some lower case letter at its start. If the label starts with a complicated construct (e.g., an accented letter that is provided via a command, e.g., `\^a` instead of a UTF-8 character like ä) one has to surround everything that needs uppercasing in a brace group in the definition of `\labelformat`.⁴⁰

```

158 % \changes{v1.1s}{2024/12/10}{Replace \cs{@tempa} with \cs{reserved@a} (gh/1579)}

ltproperties.dtx

Abstract

This code implements command to record and (expandably) reference document properties. It extends the standard `\label/\ref/\pageref` commands.

1 Introduction

The module allows to record the “current state” of various document properties (typically the content of macros and values of counters) and to access them in other places through a label. The list of properties that can be recorded and retrieved are not fix and can be extended by the user. The values of the properties are recorded in the `.aux` file and can be retrieved at the second compilation.

The module uses the ideas of properties and labels. A label is a document reference point: a name for the user. An property is something that L^AT_EX can track, such as a page number, section number or name. The names of labels and properties may be arbitrary. Note that there is a single namespace for each.

2 Design discussion

The design here largely follows ideas from `zref`. In particular, there are two independent concepts: properties that can be recorded between runs, and labels which consist of lists of these properties. The reason for the split is that individual labels will want to record some but not all properties. For examples, a label concerned with position would track the *x* and *y* coordinates of the current point, but not for example the page number.

In the current implementation, properties share a single namespace. This allows multiple lists to re-use the same properties, for example page number, absolute page number, etc. This does mean that *changing* a standard property is an issue. However, some properties have complex definitions (again, see `zref` at present): having them in a single shared space avoids the need to copy code.

Labels could be implemented as prop data. That is not done at present as there is no obvious need to map to or copy the data. As such, faster performance is available using a hash table approach as in a “classical” set up. Data written to the `.aux` file uses simple paired *balanced text* not keyvals: this avoids any restrictions on names and again offers increased performance.

The `expl3` versions of the label command do not use `\@bsphack/\@esphack` to avoid double spaces, but the L^AT_EX 2_ε command does as it lives at the document command level.

The reference commands are expandable.

Currently the code has nearly no impact on the main `\label` and `\ref` commands as too many external packages rely on the concrete implementation. There is one exception: the label names share the same namespace. That means that if both `\label{ABC}` and `\RecordProperties{ABC}{page}` are used there is a warning `Label ‘ABC’ multiply defined`.

3 Handling unknown labels and properties

With the standard `\label/\ref` commands the requested label is either in the `.aux`-file (and so known) or not. In the first case the stored value can be used, in the second case the reference commands print two question marks.

With flexible property lists a reference commands asks for the value of a specific property stored under a label name and we have to consider more variants:

- If the requested property is unknown (not declared) the system is not correctly set up and an error is issued.
- If the label is unknown, the default of the property is used.
- If the label is known, but doesn't provide a value for the property then again the default of the property is used.
- The command `\property_ref:nnn` allows to give a local default which is used instead of the property default in the two cases before.

4 Rerun messages

As the reference commands are expandable they can neither issue a message that the label or the label-property combination is unknown, nor can they trigger the rerun message at the end of the L^AT_EX run.

Where needed such messages must therefore be triggered manually. For this two commands are provided: `\property_ref_undefined_warn:` and `\property_ref_-undefined_warn:nn`. See below for a description.

5 Open points

- The `xpos` and `ypos` properties require that the position is stored first but there is no (public) engine independent interface yet. Code must use `\tex_savepos:D`.

6 Code interfaces

```
\property_new:nnnn \property_new:nnnn {⟨property⟩} {⟨setpoint⟩} {⟨default⟩} {⟨code⟩}
\property_gset:nnnn \property_gset:nnnn {⟨property⟩} {⟨setpoint⟩} {⟨default⟩} {⟨code⟩}
```

L^AT_EX 2_E-interface: see `\NewProperty`, `\SetProperty`.

Sets the `⟨property⟩` to have the `⟨default⟩` specified, and at the `⟨setpoint⟩` (either now or `shipout`) to write the result of the `⟨code⟩` as part of a label. The `⟨code⟩` should be expandable. The expansion of `⟨code⟩` (the value of the property) is written to the `.aux` file and read back from there at the next compilation. Values should assume that the standard L^AT_EX catcode régime with @ a letter is active then.

If the property is declared within a package it is suggested that its name is build from letters, hyphens and slashes, and is always structured as follows:

`⟨package-name⟩/⟨property-name⟩`.

<code>\property_record:nN</code>	<code>\property_record:nN {<label>} {clist var}</code>
<code>\property_record:nn</code>	<code>\property_record:nn {<label>} {<clist>}</code>
<code>\property_record:(nV ee)</code>	<p><small>L<small>A</small>T<small>E</small>X 2<small>E</small>-interface: see \RecordProperties.</small></p> <p><small>Writes the list of properties given by the <i>clist</i> to the .aux file with the <i>label</i> specified.</small></p>
<code>\property_ref:nn *</code>	<code>\property_ref:nn {<label>} {<property>}</code>
<code>\property_ref:ee *</code>	<p><small>L<small>A</small>T<small>E</small>X 2<small>E</small>-interface: see \RefProperty.</small></p> <p><small>Expands to the value of the <i>property</i> for the <i>label</i>, if available, and the default value of the property otherwise. `\property_if_exist_p:n` * `\property_if_exist_p:n {\<property>}`
`\property_if_exist_p:e` * `\property_if_exist:nTF {\<property>} {\<true code>} {\<false code>}`
`\property_if_exist:nTF` * LATEX 2 ε -interface: `\IfPropertyExistsTF`.
`\property_if_exist:eTF` * Tests if the `\<property>` has been declared.

`\property_if_recorded_p:n` * `\property_if_recorded_p:n {\<label>}`
`\property_if_recorded_p:e` * `\property_if_recorded:nTF {\<label>} {\<true code>} {\<false code>}`
`\property_if_recorded:nTF` *
`\property_if_recorded:eTF` *

LATEX 2 ε -interface: `\IfLabelExistsTF`
 Tests if the `\<label>` is known. This is also true if the label has been set with the standard `\label` command.

`\property_if_recorded_p:nn` * `\property_if_recorded_p:nn {\<label>} {\<property>}`
`\property_if_recorded_p:ee` * `\property_if_recorded:nnTF {\<label>} {\<property>} {\<true code>} {\<false code>}`
`\property_if_recorded:nnTF` *
`\property_if_recorded:eeTF` *

LATEX 2 ε -interface: `\IfPropertyRecordedTF`.
 Tests if the label `\<label>` is known and if it provides a value of the `\<property>`.

7 Auxiliary file interfaces

`\new@label@record` `\new@label@record {\<label>} {\<data>}`

This is a command only for use in the `.aux` file. It loads the key–value list of `\<data>` to be available for the `\<label>`.

8 LATEX 2 ε interface

The LaTeXe interfaces always expand label and property arguments. This means that one must be careful when using active chars or commands in the names. UTF8-chars are protected and should be safe, similar most babel shorthands.

`\NewProperty` `\NewProperty {\<property>} {\<setpoint>} {\<default>} {\<code>}`
`\SetProperty` `\SetProperty {\<property>} {\<setpoint>} {\<default>} {\<code>}`

Sets the `\<property>` to have the `\<default>` specified, and at the `\<setpoint>` (either `now` or `shipout`) to write the result of the `\<code>` as part of a label. The `\<code>` should be expandable. The expansion of `\<code>` (the value of the property) is written to the `.aux` file and read back from there at the next compilation (at which point normally the standard LATEX catcode régime with @ a letter is active).

`\RecordProperties` `\RecordProperties {\<label>} {\<clist>}`

Writes the list of properties given by the `\<clist>` to the `.aux` file with the `\<label>` specified. Similar to the standard `\label` command the arguments are expanded. So `\<clist>` can be a macro containing a list of properties. Also similar to the standard `\label` command, the command is surrounded by an `\@bsphack/\@esphack` pair to preserve spacing.

`\RefProperty * \RefProperty [<local default>] {<label>} {<property>}`

Expands to the value of the `<property>` for the `<label>`, if available, and the default value of the property or – if given – to `<local default>` otherwise. If `{<property>}` has not been declared an error is issued.

`\IfPropertyExistsTF \IfPropertyExistsTF {<property>} {<true code>} {<false code>}`

`\IfPropertyExistsT` Tests if the `<property>` has been declared.

`\IfLabelExistsTF \IfLabelExistsTF {<label>} {<true code>} {<false code>}`

`\IfLabelExistsT` `\IfLabelExistsF` Tests if the `<label>` has been recorded. This is also true if a label has been set with the standard `\label` command.

`\IfPropertyRecordedTF \IfPropertyRecordedTF {<label>} {<property>} {<true code>} {<false code>}`

`\IfPropertyRecordedT` `\IfPropertyRecordedF` Tests if the label and a value of the `<property>` for the `<label>` are both known.

`\RefUndefinedWarn \RefUndefinedWarn {<label>} {<property>}`

Triggers the standard warning

LaTeX Warning: There were undefined references.

at the end of the document if the reference for `<label>` and `<property>` can not be resolved. At the point where it is called it also issues the warning

Reference ‘`<label>`’ on page `<page>` undefined
if the label is unknown, or the more specific

Property ‘`<property>`’ undefined for reference ‘`<label>`’ on page `<page>` if
the label is known but doesn’t provide a value for the requested property.

9 Pre-declared properties

`abspage` (shipout) The absolute value of the current page: starts at 1 and increases monotonically at each shipout.

`page` (shipout) The current page as given by `\thepage`: this may or may not be a numerical value, depending on the current style. Contrast with `\abspage`. You get this value also with the standard `\label/\pageref`.

`pagenum` (shipout) The current page as arabic number. This is suitable for integer operations and comparisons.

`label` (now) The content of `\@currentlabel`. This is the value that you get also with the standard `\label/\ref`.

title (now) The content of `\@currentlabelname`. This command is filled beside others by the `nameref` package and some classes (e.g. `memoir`).

target (now) The content of `\@currentHref`. This command is normally filled by for example `hyperref` and gives the name of the last destination it created.

pagetarget (shipout) The content of `\@currentHpage`. This command is filled for example by a recent version of `hyperref` and then gives the name of the last page destination it created.

counter (now) The content of `\@currentcounter`. This command contains after a `\refstepcounter` the name of the counter.

xpos (shipout) This stores the *x* and *y* coordinates of a point previously stored with ypos `\pdfsavepos/\savepos`. E.g. (if `bidi` is used it can be necessary to save the position before and after the label):

```
\tex_savepos:D  
\property_record:nn{myposition}{xpos,ypos}  
\tex_savepos:D
```

10 The Implementation

```
1 (*2ekernel | latexrelease)  
2 \ExplSyntaxOn  
3 (@@=property)  
4 (|latexrelease|\NewModuleRelease{2023/11/01}{ltproperties}  
5 (|latexrelease| {Cross-referencing-properties})
```

The approach here is based closely on that from `zref`; separate out lists of properties and the properties themselves, so the latter can be used multiple times and in varying combinations. However, not everything is a straight copy. Firstly, we treat lists of properties as simple comma lists: that allows us to have either saved or dynamic lists and to avoid another data structure. The cost is that errors are detected at point-of-use, but in any real case that should be true anyway (and is true for `\zref@labelbyprop` already). Secondly, we allow properties to have arbitrary names, as the code does not require them to tokenize as control sequences.

As properties can be reset, they are not constants. But they also have various pieces of required data. So we use the same approach as color and make them declarations. Data-wise, we need the detail of the implementation, the default and a flag to show if the code works now or at shipout. This last entry is done using text so needs a check. We could use a set of `prop` here, but as we never need to map or copy the lists, we can gain performance using the hash table approach.

```
6 \cs_new_protected:Npn \property_new:nnnn #1#2#3#4
```

```

7   {
8     \cs_if_free:cTF { __property_code_ #1 : }
9     {
10       \exp_args:Nx \__property_gset:nnnn { \tl_to_str:n {#1} }
11         {#2} {#3} {#4}
12     }
13     {
14       \msg_error:nn { property }{ exists }{#1}
15     }
16   }
17 \cs_new_protected:Npn \property_gset:nnnn #1#2#3#4
18   {
19     \__property_gset:ennn { \tl_to_str:n {#1} }
20       {#2} {#3} {#4}
21   }
22 \cs_new_protected:Npn \__property_gset:nnnn #1#2#3#4
23   {
24     \cs_gset:cpn { __property_code_ #1 : } {#4}
25     \tl_gclear_new:c { g__property_default_ #1 _tl }
26     \tl_gset:cn { g__property_default_ #1 _tl } {#3}
27     \bool_if_exist:cF { g__property_shipout_ #1 _tl }
28       { \bool_new:c { g__property_shipout_ #1 _tl } }
29     \str_case:nnF {#2}
30     {
31       { now } { { \bool_gset_false:c { g__property_shipout_ #1 _tl } } }
32         { shipout }
33           { \bool_gset_true:c { g__property_shipout_ #1 _tl } }
34     }
35     { \msg_error:nnnn { property } { unknown-setpoint } {#1} {#2} }
36   }
37 \cs_generate_variant:Nn \__property_gset:nnnn {ennn}

```

(End of definition for `\property_new:nnnn`, `\property_gset:nnnn`, and `__property_gset:nnnn`.
These functions are documented on page [806](#).)

`\NewProperty` For consistency we expand the property name, but this doesn't warrant a variant of the L3-commands.
`\SetProperty`

```

38 \cs_new_protected:Npn \NewProperty #1#2#3#4
39   {
40     \protected@edef\reserved@a{#1}
41     \exp_args:No \property_new:nnnn {\reserved@a} {#2}{#3}{#4}
42   }
43 \cs_new_protected:Npn \SetProperty #1#2#3#4
44   {
45     \protected@edef\reserved@a{#1}
46     \exp_args:No \property_gset:nnnn {\reserved@a} {#2}{#3}{#4}
47   }

```

(End of definition for `\NewProperty` and `\SetProperty`. These functions are documented on page [808](#).)

`\property_record:nn`
`\property_record:nn`
`\property_record:nnV`
`\property_record:ee`
`\property_record:oo`
`__property_record:nn`
`__property_record:en`
`__property_record_value:n`
 `__property_record_value_aux:n`
 `__property_record_value_aux:e`

Writing data when it is labelled means expanding at this stage and possibly later too. That is all pretty easy using `expl3`: we accept a stray comma at the end of the list as that is easier to deal with than trying to tidy up, and there is no real downside.

48 `\cs_new_protected:Npn \property_record:nN #1#2`

```

49 { \property_record:nV {#1} #2 }
50 \cs_new_protected:Npn \property_record:nn #1#2
51 { __property_record:en { \tl_to_str:n {#1} } {#2} }
52 \cs_generate_variant:Nn \property_record:nn { nV , ee, oo }
53 \cs_new_protected:Npn __property_record:nn #1#2
54 {
55 \protected@write \auxout {}
56 {
57 \token_to_str:N \new@label@record
58 {#1}
59 { \clist_map_function:nN {#2} __property_record_value:n }
60 }
61 }
62 \cs_generate_variant:Nn __property_record:nn { e }
63 \cs_new:Npn __property_record_value:n #1
64 { __property_record_value_aux:e { \tl_to_str:n {#1} } }
65 \cs_new:Npn __property_record_value_aux:n #1
66 {
67 \cs_if_exist:cTF { __property_code_ #1 : }
68 {
69 {#1}
70 {
71 \bool_if:cTF { g__property_shipout_ #1 _tl }
72 { \exp_not:c }
73 { \use:c }
74 { __property_code_ #1 : }
75 }
76 }
77 { \msg_expandable_error:nnn { property } { not-declared } {#1} }
78 }
79 \cs_generate_variant:Nn __property_record_value_aux:n { e }

```

(End of definition for `\property_record:nN` and others. These functions are documented on page 807.)

\RecordProperties

```

80 \NewDocumentCommand\RecordProperties { m m }
81 {
82 \@bsphack
83 \protected@edef\reserved@a{#1}
84 \protected@edef\reserved@b{#2}
85 \property_record:oo {\reserved@a}{\reserved@b}
86 \@esphack
87 }

```

(End of definition for `\RecordProperties`. This function is documented on page 808.)

10.1 Reference commands

`l__property_ref_flag` A flag that is set if a reference couldn't be resolved.

```

88 \flag_new:n { l__property_ref_flag }

```

(End of definition for `l__property_ref_flag`.)

\property_ref:nn Search for the label/property combination, and if not found fall back to the default of the property.

```

89 \cs_new:Npn \property_ref:nn #1#2
90  {
91      \__property_ref:een
92      { \tl_to_str:n {#1} }
93      { \tl_to_str:n {#2} }
94      { \tl_use:c { g__property_default_ #2 _tl } }
95  }
96 \cs_generate_variant:Nn \property_ref:nn {ee}

```

(End of definition for **\property_ref:nn**. This function is documented on page 807.)

\property_ref:nnn This allows to set a local default value which overrides the default value of the property.

```

97 \cs_new:Npn \property_ref:nnn #1#2#3
98  {
99      \__property_ref:een
100     { \tl_to_str:n {#1} }
101     { \tl_to_str:n {#2} }
102     {#3}
103  }
104 \cs_new:Npn \__property_ref:nnn #1#2#3
105  {
106      \tl_if_exist:cTF { g__property_label_ #1 _ #2 _tl }
107      { \tl_use:c { g__property_label_ #1 _ #2 _tl } }
108      {
109          \flag_if_raised:nF
110          { l__property_ref_flag } { \flag_raise:n { l__property_ref_flag } }
111      }
112      \tl_if_exist:cTF { g__property_default_ #2 _tl }
113      { #3 }
114      { \msg_expandable_error:nnn { property } { not-declared } {#2} }
115  }
116 \cs_generate_variant:Nn \__property_ref:nnn { ee }
117 \cs_generate_variant:Nn \property_ref:nnn {een}

```

We test for the default of the property only to check if the property has been declared.

```

111      \tl_if_exist:cTF { g__property_default_ #2 _tl }
112      { #3 }
113      { \msg_expandable_error:nnn { property } { not-declared } {#2} }
114  }
115 }
116 \cs_generate_variant:Nn \__property_ref:nnn { ee }
117 \cs_generate_variant:Nn \property_ref:nnn {een}

```

(End of definition for **\property_ref:nnn** and **__property_ref:nnn**. This function is documented on page 807.)

\RefProperty Search for the label/property combination, and if not found fall back to the default of the property or the given default.

```

118 \NewExpandableDocumentCommand \RefProperty { o m m }
119  {
120      \IfNoValueTF {#1}
121      {
122          \property_ref:ee {#2}{#3}
123      }
124      {
125          \property_ref:een {#2}{#3}{#1}
126      }
127  }

```

(End of definition for **\RefProperty**. This function is documented on page 809.)

`\new@label@record` A standard recursion loop.

```

128 \cs_new_protected:Npn \new@label@record #1#2
129 {
130     \tl_if_exist:cTF { r@#1 }
131     {
132         \gdef \multiplelabels
133             { \@latex@warning@no@line { There~were~multiply-defined~labels } }
134             \@latex@warning@no@line { Label~'#1'~multiply-defined }
135     }
136     {

147     \__property_data:nnn {#1}
148 }
```

This command is used in `\enddocument` to test if some label values have changed.

```

149 \cs_new_protected:Npn \kernel@new@label@record@testdef #1 #2
150 {
151     \tl_if_eq:cnF { r@#1 } {#2}
152     { \otempswatrue }
153 }
```

(End of definition for `\new@label@record` and `__property_data:nnn`. This function is documented on page 808.)

10.2 Tests and warnings

`\property_if_exist_p:n` Tests if property has been declared.

`\property_if_exist:nTF`

```

154 \prg_new_conditional:Npnn \property_if_exist:n #1 { p , T , F , TF }
155 % #1 property
156 {
157     \cs_if_exist:cTF { __property_code_ #1 : }
158     {
159         \prg_return_true:
160     }
161     {
162         \prg_return_false:
163     }
164 }
165 \prg_generate_conditional_variant:Nnn \property_if_exist:n {e} { p , T , F , TF }
```

(End of definition for `\property_if_exist:nTF`. This function is documented on page 808.)

`\IfPropertyExistsTF`
`\IfPropertyExistsT`
`\IfPropertyExistsF`

```

166 \cs_new_eq:NN \IfPropertyExistsTF \property_if_exist:eTF
167 \cs_new:Npn \IfPropertyExistsT #1#2 {\property_if_exist:eTF {#1}{#2}{ } }
168 \cs_new:Npn \IfPropertyExistsF #1 {\property_if_exist:eTF {#1}{ } }
```

(End of definition for `\IfPropertyExistsTF`, `\IfPropertyExistsT`, and `\IfPropertyExistsF`. These functions are documented on page 809.)

`\property_if_recorded_p:n` Tests if the label has been set. This can then be used to setup e.g. rerun messages.

```

169 \prg_new_conditional:Npnn \property_if_recorded:n #1 { p , T , F , TF }
170   % #1 label
171   {
172     \tl_if_exist:cTF { r@#1 }
173     {
174       \prg_return_true:
175     }
176     {
177       \prg_return_false:
178     }
179   }
180 \prg_generate_conditional_variant:Nnn \property_if_recorded:n {e} { p , T , F , TF }
```

(End of definition for `\property_if_recorded:nTF`. This function is documented on page 808.)

`\IfLabelExistsTF`

```

\IfLabelExistsT
181 \cs_new_eq:NN \IfLabelExistsTF \property_if_recorded:eTF
182 \cs_new:Npn \IfLabelExistsT #1#2 {\property_if_recorded:eTF {#1}{#2}{}} }
183 \cs_new:Npn \IfLabelExistsF #1 {\property_if_recorded:eTF {#1}{}} }
```

(End of definition for `\IfLabelExistsTF`, `\IfLabelExistsT`, and `\IfLabelExistsF`. These functions are documented on page 809.)

`\property_if_recorded_p:nn` tests if the label/property combination has been set. This can then be used to setup e.g. rerun messages.

```

184 \prg_new_conditional:Npnn \property_if_recorded:nn #1#2 { p , T , F , TF }
185   % #1 label #2 property
186   {
187     \tl_if_exist:cTF { g__property_label_ \tl_to_str:n {#1} _ \tl_to_str:n {#2} _tl }
188     {
189       \prg_return_true:
190     }
191     {
192       \prg_return_false:
193     }
194   }
195 \prg_generate_conditional_variant:Nnn \property_if_recorded:nn {ee} { p , T , F , TF }
```

(End of definition for `\property_if_recorded:nnTF`. This function is documented on page 808.)

`\IfPropertyRecordedTF`

```

\IfPropertyRecordedT
196 \cs_new_eq:NN \IfPropertyRecordedTF \property_if_recorded:eeTF
197 \cs_new:Npn \IfPropertyRecordedT #1#2#3 { \property_if_recorded:eeTF {#1}{#2}{#3}{}} }
198 \cs_new:Npn \IfPropertyRecordedF #1#2#3 { \property_if_recorded:eeTF {#1}{#2}{}}{#3} }
```

(End of definition for `\IfPropertyRecordedTF`, `\IfPropertyRecordedT`, and `\IfPropertyRecordedF`. These functions are documented on page 809.)

```
\property_ref undefined_warn: \G@refundefinedtrue is defined in ltxref and redefines a warning message.

1 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`, The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1  <*2ekernel>
2  \message{environments,}
```

1.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@end` is defined to be the `\end` command of TeX82.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end TeX in the middle.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

12 \def\enddocument{%
```

The \end{document} hook is executed first. If necessary it can contain a \clearpage to output dangling floats first. In this position it can also contain something like \end{foo} so that the whole document effectively starts and ends with some special environment. However, this must be used with care, eg if two applications would use this without knowledge of each other the order of the environments will be wrong after all. \AtEndDocument is redefined at this point so that and such commands that get into the hook do not chase their tail...

```

13 \@kernel@before@enddocument
14 \UseOneTimeHook{enddocument}%
15 \@kernel@after@enddocument
```

```

16   \@checkend{document}%
17   \clearpage
18   \UseOneTimeHook{enddocument/afterlastpage}%
19   \@kernel@after@enddocument@afterlastpage
20   \begingroup

The previous line is equiv to setting

```

\def\newlabel{\@testdef r}%
\def\bibcite{\@testdef b}%

```

We use `\@@input` to load the `.aux` file, so that it doesn't show up in the list of files produced by `\listfiles`.

```

26   \@tempswafalse
27   \makeatletter \@@input\jobname.aux
28   \fi
29   \UseOneTimeHook{enddocument/afteraux}%

```

Next hook is expect to contain only code for writing info messages on the terminal.

```

30   \UseOneTimeHook{enddocument/info}%
31   \endgroup
32   \UseOneTimeHook{enddocument/end}%
33   \deadcycles\z@\@@end}

```

The public hooks used in `\enddocument`:

```

34 \NewHook{enddocument}
35 \NewHook{enddocument/afterlastpage}
36 \NewHook{enddocument/afteraux}
37 \NewHook{enddocument/info}
38 \NewHook{enddocument/end}

```

This is one of the few places where we already add data and rules to a hook already in the kernel.

If we roll back we have to drop stuff before adding chunks, otherwise the code will just be appended, and thus doubled. This would result in a harmless warning during the format generation, because in that case the code chunk label doesn't exist, and therefore can't be dropped.

```

First we check for font size substitution bigger than \fontsubfuzz. The \relax is necessary because this is a macro not a register.

```
53 \ifdim \font@submax >\fontsubfuzz\relax
```

In case you wonder about the \gobbletwo inside the message below, this is a horrible hack to remove the tokens \on@line. that are added by \font@warning at the end.

```
54     \@font@warning{Size substitutions with differences\MessageBreak
55         up to \font@submax\space have occurred.\gobbletwo}%
56 \fi
```

The macro \defaultsubs is initially \relax but gets redefined to produce a warning if there have been some default font substitutions.

```
57 \defaultsubs
```

The macro \refundefined is initially \relax but gets redefined to produce a warning if there are undefined refs.

```
58 \refundefined
```

If a label is defined more than once, \tempswa will always be true and thus produce a “Label(s) may ...” warning. But since a rerun will not solve that problem (unless one uses a package like variorref that generates labels on the fly), we suppress this message.

```
59 \if@filesw
60   \ifx \multiplelabels \relax
61     \if@tempswa
62       \@latex@warning{no@line{Label(s) may have changed.
63           Rerun to get cross-references right}%
64     \fi
65   \else
66     \multiplelabels
67   \fi
68   \ifx \extra@page@added \relax
69     \@latex@warning{no@line{Temporary extra page added at the end.
70           Rerun to get it removed}%
71   \fi
72 \fi
73 }
```

We could think of adding a warning that nothing can be corrected while \nofiles is in force. In the past the warnings related to the aux file are simply suppressed in this case.

```
72 \fi
73 }
```

```

(*End of definition for \@testdef.*)

Reading data from auxiliary files (like `.toc` normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by TeX during that process.

However, especially the `.toc` file might be read in L-R mode (in cases the `\tableofcontents` attempts to put, say, a list of sub-sections as a paragraph). In that case the newlines after a line like

```
\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}
```

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using `\endlinechar=-1` but that has the danger that it drops some valid endlines that should be converted to spaces (for example, when the user edited the TOC and then used `\nofiles` to preserve it).

So the approach taken instead is this:

- `\addcontentsline` adds the command `\protected@file@percent` to the end of the second argument of `\@writefile` that is written to the `.aux`. As the name indicates this is a protected macro so it doesn't change if it is written out.
- When the `.aux` is read back in at the end of the run, `\@writefile` is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change `\@writefile` slightly: basically it looks at the second argument and if the last token in there is `\protected@file@percent` then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued `\addtocontents`, or from some package that uses `\@writefile` for writing its own files) then the command behaves exactly as before.

`\protected@file@percent` Dummy cs to be replaced by a percent sign inside `\@writefile`. If it survives (when used incorrectly) it will expand to nothing in a typesetting context.

```

197 </2ekernel>
198 {*2ekernel | latexrelease}

```

```

199  \iflatexrelease\IncludeInRelease{2018/12/01}%
200  \iflatexrelease
201    {\protected@file@percent}{Mask line endings}%

```

(End of definition for `\protected@file@percent`.)

`\add@percent@to@temptokena` Helper function which is used to inspect a sequence of tokens (the second argument of `\@writefile` and if the last token is `\protected@file@percent` it will replace it by a harmless percent. The result is saved in `\@temptokena` for later use.

```

202  \catcode`\^^A=9
203  \long\gdef\add@percent@to@temptokena
204    #1\protected@file@percent#2\add@percent@to@temptokena

```

When we call this macro in `\@writefile` we stick in `\empty` at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The `\expandafter` then expands this extra token away again.

```

205  {\expandafter\ifx\expandafter X\detokenize{#2}X\expandafter\dont@add@percent@to@temptokena
206    \expandafter\do@add@percent@to@temptokena\fi{#1}}
207  \long\def\dont@add@percent@to@temptokena#1{%
208    \@temptokena\expandafter{#1}}

```

`\@writefile` will read this code in high-speed mode in certain situations. During that it will only look for `\if` tests but not actually execute the `\catcode` change above. As a result it will drop anything after the `%` character in the definition. Therefore the `\fi` needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```

209  \begingroup
210  \catcode`\%=12
211  \catcode`\^^A=14
212  \long\gdef\do@add@percent@to@temptokena#1{\@temptokena\expandafter{#1}%``A

```

Can't be on the same line as the `%` — see above.

```

Before the \document code is executed we have to first undo the \endgroup as there should be none for this environment to avoid that changes on top-level unnecessarily go to TeX's savestack, and we have to initialize all hooks in the hook system. So we need to test for this environment name. But once it has been found all this testing is no longer needed and so we redefine \@execute@begin@hook to simply use the hook.

```
257 \def\@execute@begin@hook #1{%
258     \expandafter\ifx\csname #1\endcsname\document
259     \endgroup
260     \gdef\@execute@begin@hook##1{\UseHook{env/##1/begin}}%
261     \expl@@@initialize@all@%
262 \fi

```

If this is an environment before \begin{document} we just run the hook so this can be outside the test.

```
263 \UseHook{env/#1/begin}%
264 }
265 </2ekernel | latexrelease>

Also undo the internal commands as some packages unfortunately test for their existence instead of using `\IfFormatAtLeastTF`.

```

306 〈latexrelease〉\expandafter\let\csname begin \endcsname\@undefined
307 〈latexrelease〉
308 〈latexrelease〉\EndIncludeInRelease
309 {*2ekernel}

```

(End of definition for `\begin`.)

`\end` The top level definition for `\end`.

```

310  </2ekernel>
311  <*2ekernel | latexrelease>
312  <latexrelease>\IncludeInRelease{2019/10/01}%
313  <latexrelease>          {\end}{Making \begin/\end robust}%

```

While `\begin` was made robust simply by using `\DeclareRobustCommand` we need to be a bit more subtle with `\end` as there are packages out there that try to look into the top-level contents of `\end{foo}` (that is at the expansion of `\endfoo`) to see if it contains certain macros. This is done by hitting `\end{foo}` with three `\expandafters`, the first to get

```
\csname endfoo\endcsname      @checkend{foo}% etc.
```

the second to expand the `\csname`, i.e., to get to

```
\endfoo      @checkend{foo}% etc.
```

and the third to finally get to the top-level content of `\endfoo`, i.e.

```
<top-level content of \endfoo> @checkend{foo}% etc.
```

Therefore a robust replacement should produce the same results after three expansions (there first is obviously different).

Basically the definition of `\end` should either produce `\protect\end_` (when not doing typesetting) or it should produce `\end_` (without the `\protect`) when doing typesetting. Furthermore, it should (when in typesetting mode) show exactly the same result as `\end_` (which is the original fragile definition of `\end`) when you expand either of them twice, i.e.,

```
\endfoo      @checkend{foo}% etc.
```

That is achieved with the code below (which is worth studying carefully).

There is some trickery involved here: in particular we use `\romannumeral` to change a single expansion into three successive expansions in one go. That primitive expands until it has scanned a number (0 in this case, so it doesn't produce any output) and so it allows us to place arbitrary many `\expandafters` inside that are all going to be executed when `\romannumeral` is hit by a single `\expandafter`.

```

314  \edef\end
315  {\unexpanded{%
316    \romannumeral
317      \ifx\protect\@typeset@protect
318        \expandafter%1

1.2 Center, Flushright, Flushleft

```
412 \message{center,}
```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```

\center, \flushright and \flushleft set
\rightskip = 0pt or \@flushglue (as appropriate)
\leftskip = 0pt or \@flushglue (as appropriate)
\parindent = 0pt
\parfillskip = 0pt. (except \flushleft)
\\ == \par \vskip -\parskip
\\[LENGTH] == \\ \vskip LENGTH
\\* == \par \penalty 10000 \vskip -\parskip
\\*[LEN] == \\* \vskip LENGTH

```

They invoke the trivlist environment to handle vertical spacing before and after them.

`\centering`, `\raggedright` and `\raggedleft` are the declaration analogs of the above.

`\raggedright` has a more universal effect, however. It sets `\rightskip := flushglue`. Every environment, like the list environments, that set `\rightskip` to its 'normal' value set it to `\@rightskip`

End of historical L^AT_EX 2.09 comments.

1.3 Verbatim

```
498 \message{verbatim,}
```

The `verbatim` environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode`'d to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes '...' as its argument, and sets it verbatim in `\ttfamily` font.

The `*`-variants of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

600  {*2ekernel}

```

\@setupverbvisible In pdf \TeX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In Xe \TeX or Lua \TeX a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of \verbvisible and if it is \asciispace we assume that the char32 can be used (e.g., in pdft \TeX). We then redefine \xobeysp so that after running \vobeyspaces we get characters from slot 32 for each active space.

```

601 {/2ekernel}

608   \else

```

Otherwise we measure the width of a character in the mono-spaced current font and place a \verbvisible into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing \verbvisible one could use, for example, the \textvisible of the current typewriter font.

```

File 38

ltmath.dtx

1 Math setup

This file contains a lot of the original plain T_EX code, as well as the L^AT_EX environments for math. It still needs sorting out.

```
1  <*2ekernel>
2  \message{math definitions,}
```

1.1 Math commands based on plain T_EX

1.1.1 The log-like functions

\log The standard operators:

```
3  \DeclareRobustCommand\log{\mathop{\operator@font log}\nolimits}
4  \DeclareRobustCommand\lg{\mathop{\operator@font lg}\nolimits}
5  \DeclareRobustCommand\ln{\mathop{\operator@font ln}\nolimits}
6  \DeclareRobustCommand\lim{\mathop{\operator@font lim}\nolimits}
7  \DeclareRobustCommand\limsup{\mathop{\operator@font lim\,,sup}\nolimits}
8  \DeclareRobustCommand\liminf{\mathop{\operator@font lim\,,inf}\nolimits}
9  \DeclareRobustCommand\sin{\mathop{\operator@font sin}\nolimits}
10 \DeclareRobustCommand\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \DeclareRobustCommand\sinh{\mathop{\operator@font sinh}\nolimits}
12 \DeclareRobustCommand\cos{\mathop{\operator@font cos}\nolimits}
13 \DeclareRobustCommand\arccos{\mathop{\operator@font arccos}\nolimits}
14 \DeclareRobustCommand\cosh{\mathop{\operator@font cosh}\nolimits}
15 \DeclareRobustCommand\tan{\mathop{\operator@font tan}\nolimits}
16 \DeclareRobustCommand\arctan{\mathop{\operator@font arctan}\nolimits}
17 \DeclareRobustCommand\tanh{\mathop{\operator@font tanh}\nolimits}
18 \DeclareRobustCommand\cot{\mathop{\operator@font cot}\nolimits}
19 \DeclareRobustCommand\coth{\mathop{\operator@font coth}\nolimits}
20 \DeclareRobustCommand\sec{\mathop{\operator@font sec}\nolimits}
21 \DeclareRobustCommand\csc{\mathop{\operator@font csc}\nolimits}
22 \DeclareRobustCommand\max{\mathop{\operator@font max}\nolimits}
23 \DeclareRobustCommand\min{\mathop{\operator@font min}\nolimits}
24 \DeclareRobustCommand\sup{\mathop{\operator@font sup}\nolimits}
25 \DeclareRobustCommand\inf{\mathop{\operator@font inf}\nolimits}
26 \DeclareRobustCommand\arg{\mathop{\operator@font arg}\nolimits}
27 \DeclareRobustCommand\ker{\mathop{\operator@font ker}\nolimits}
28 \DeclareRobustCommand\dim{\mathop{\operator@font dim}\nolimits}
29 \DeclareRobustCommand\hom{\mathop{\operator@font hom}\nolimits}
30 \DeclareRobustCommand\det{\mathop{\operator@font det}\nolimits}
31 \DeclareRobustCommand\exp{\mathop{\operator@font exp}\nolimits}
32 \DeclareRobustCommand\Pr{\mathop{\operator@font Pr}\nolimits}
33 \DeclareRobustCommand\gcd{\mathop{\operator@font gcd}\nolimits}
34 \DeclareRobustCommand\deg{\mathop{\operator@font deg}\nolimits}
```

(End of definition for \log.)

\bmod And some operators have to be done by hand:

```

35 \DeclareRobustCommand\bmod{%
36   \nonscript\mskip-\medmuskip\mkern5mu%
37   \mathbin{\operator@font mod}\penalty900\mkern5mu%
38   \nonscript\mskip-\medmuskip}
(End of definition for \bmod)

\pmod
39 \DeclareRobustCommand\pmod[1]{%
40   \allowbreak\mkern18mu(\operator@font mod)\,,\,#1)}
(End of definition for \pmod.)

```

1.1.2 Biggggg

\big Variants on \big and friends for use with delimiters:

```

41 \DeclareRobustCommand\bigl{\mathopen\big}
42 \DeclareRobustCommand\bigm{\mathrel\big}
43 \DeclareRobustCommand\bigr{\mathclose\big}
44 \DeclareRobustCommand\Bigl{\mathopen\Big}
45 \DeclareRobustCommand\Bigm{\mathrel\Big}
46 \DeclareRobustCommand\Bigr{\mathclose\Big}
47 \DeclareRobustCommand\biggl{\mathopen\bigg}
48 \DeclareRobustCommand\biggm{\mathrel\bigg}
49 \DeclareRobustCommand\biggr{\mathclose\bigg}
50 \DeclareRobustCommand\Biggl{\mathopen\Bigg}
51 \DeclareRobustCommand\Biggm{\mathrel\Bigg}
52 \DeclareRobustCommand\Biggr{\mathclose\Bigg}

```

(End of definition for \big.)

1.1.3 The UNSORTED Rest

The other math commands are lifted from plain TeX.

```

\jot
53 \newdimen\jot
54 \jot=3pt
(End of definition for \jot.)

\interdisplaylinepenalty
55 \newcount\interdisplaylinepenalty
56 \interdisplaylinepenalty=100
(End of definition for \interdisplaylinepenalty.)

```

```

\choose
57 \def\choose{\atopwithdelims()}
(End of definition for \choose.)

```

```

\bbrack
58 \def\bbrack{\atopwithdelims[]}
(End of definition for \bbrack.)

```

```

\brace
59 \def\brace{\atopwithdelims\{\}}
(End of definition for \brace.)

\mathpalette
60 \def\mathpalette#1#2{%
61   \mathchoice
62     {#1\displaystyle{#2}}%
63     {#1\textstyle{#2}}%
64     {#1\scriptstyle{#2}}%
65     {#1\scriptscriptstyle{#2}}}
(End of definition for \mathpalette.)

\root
\rootbox
66 \newbox\rootbox
\root@t
67 \def\root#1{\of{%
68   \setbox\rootbox\hbox{$\m@th\scriptscriptstyle{#1}$}%
69   \mathpalette\root@t}}
\def\root@t#1#2{%

139 \def\mathsm@sh#1#2{%
140   \setbox\z@\hbox{$\m@th#1{#2}$}%

```

The empty brace groups in front of the smashed box (which is placed by `\finsm@sh`) ensures that a `\smash` in math is not just producing a single box with its dimensions altered, but a box plus this second ord atom. The reason is that TeX sometimes reboxes

a box if its the only thing in a place like the denominator of a fraction. This would then undo the smashing and the additional ord atom prevents that. Two ord atoms in a row do not alter the horizontal spacing in a formula so this is otherwise transparent.

```

```

\tmspace
\thinspace
\!_
\negthinspace
\:
\medspace
\negmedspace
\;
\thickspace
\negthickspace
```

Originally L^AT_EX only provided a small set of spacing commands for use in text and math, some of the commands like `\;` were only supported in math mode. `amsmath` normalized and provided all of them in text and math. This code has now been moved to the kernel so that it is generally available.

```

214  </2ekernel>
215  <*2ekernel | latexrelease>
216  <latexrelease>\IncludeInRelease{2020/10/01}%
217  <latexrelease>          {\tmspace}{amsmath spacing commands}%

\tmspace is really meant to be an internal command so it doesn't necessarily has to be robust but it was robust in amsmath so we leave it like that.
```

```

218 \DeclareRobustCommand\tmspace[3]{%
219   \ifmmode\mskip#1#2\else\leavevmode@ifvmode\kern#1#3\fi\relax}
220 \DeclareRobustCommand\,{\tmspace+\thinmuskip{.16667em}}
221 \let\thinspace\,
222 \DeclareRobustCommand\!{\tmspace-\thinmuskip{.16667em}}
223 \let\negthinspace\!
224 \DeclareRobustCommand\:{\tmspace+\medmuskip{.2222em}}
225 \let\medspace\:
```

L^AT_EX has a second name for this in its manual:

```

226 \let\>=\:
227 \DeclareRobustCommand\negmedspace{\tmspace-\medmuskip{.2222em}}
228 \DeclareRobustCommand\,{\tmspace+\thickmuskip{.2777em}}
229 \let\thickspace\;
230 \DeclareRobustCommand\negthickspace{\tmspace-\thickmuskip{.2777em}}
231 </2ekernel | latexrelease>
232 <latexrelease>\EndIncludeInRelease

(End of definition for `\eqno` and `\leqno`.)

1.3 External options to the standard document classes

1.3.1 Left equation numbering

- `\@eqnnum` To put the equation number on the left side of an equation we have to use a little trick. The number is shifted `\displaywidth` to the left inside a box of (approximately) zero width. This fails when the equation is too wide, the equation number than may overprint the equation itself.

```
454  {*\leqno}
455  \renewcommand{\eqnnum}{\hb@xt@.01\p@{}%
456          \rlap{\normalfont\normalcolor
457          \hskip -\displaywidth(\theequation)}}
458  {/\leqno}
```

(End of definition for `\@eqnnum`.)

1.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L^AT_EX 2 _{ε} 's displayed math environments.

- `\mathindent` The amount of indentation of the equations is stored in a register.

```
459  {*\fleqn}
460  \newskip\mathindent
```

The setting of `\mathindent` has to be deferred until the class file has been processed, because `\leftmargini` is still 0pt wide at the moment `fleqn.clo` is read in.

```
461  \AtEndOfClass{\mathindent\leftmargini}
```

(End of definition for `\mathindent`.)

```

eqnarray (env.) The eqnarray environment

```

516 \renewenvironment{eqnarray}%
517   \stepcounter{equation}%
518   \def\@currentlabel{\p@equation\theequation}%
519   \def\@currentcounter{equation}%
520   \global\@eqnswtrue\m@th
521   \global\@eqcnt\z@
522   \tabskip\mathindent

```

```
523 \let\\=\\eqnrcr  
524 \setlength\abovedisplayskip{\topsep}%  
525 \ifvmode  
526     \addtolength\abovedisplayskip{\partopsep}%  
527 \fi
```

When the documentclass uses a non-zero \parskip setting the \topsep might have a negative value to compensate for that. Therefore we add \parskip to \abovedisplayskip.

File 39

ltlists.dtx

1 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{\LABEL} {\COMMANDS} ... \endlist
```

which can be invoked by the user as the list environment. The *LABEL* argument specifies item labeling. *COMMANDS* contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by *ITEMLABEL*. If the argument is missing, then the *LABEL* argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{\ITEMLABEL}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{\ARG} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s *COMMANDS* argument.

A `\usecounter{\foo}` command in the second argument causes the counter *foo* to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place—i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item,
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{\...}\item\relax`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a trivlist environment must have an argument—in many cases, this will be the null argument (`\item[]`). The trivlist environment is mainly used for paragraphing environments, like verbatim, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

1.1 List and Trivlist

The following variables are used inside a list environment:

`\@totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\@listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\@mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\@inlabel` A switch that is false except between the time an `\item` is encountered and the time that TeX actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `\@inlabel = true`, it holds the labels to be put out by `\everypar`.

`\@noperitem` A switch set by `\list` when `\@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`\@noparlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`\@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`\@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\item` commands.

`\@nmbrlist` Set true by `\usecounter` command, causes list to be numbered.

`\@listctr` \def'ed by `\usecounter` to name of counter.

`\@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like tabbing should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list`'s COMMANDS argument. These parameters are all TeX skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual TeX or L^ATeX commands can be used to set them. The commands will be executed in vmode if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

1.2 Vertical Spacing (skips)

\topsep: Space between first item and preceding paragraph.

\partopsep: Extra space added to \topsep when environment starts a new paragraph (is called in vmode).

\itemsep: Space between successive items.

\parsep: Space between paragraphs within an item – the \parskip for this environment.

1.3 Penalties

\begin{parpenalty}: put at the beginning of a list

\endparpenalty: put at end of list

\itempenalty: put between items.

1.4 Horizontal Spacing (dimens)

\leftmargin: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

\rightmargin: analogous.

\listparindent: extra indentation at beginning of every paragraph of a list except the one started by the \item command. May be negative! Usually, labeled lists have \listparindent equal to zero.

\itemindent: extra indentation added right BEFORE an item label.

\labelwidth: nominal width of box that contains the label. If the natural width of the label \leq \labelwidth, then the label is flushed right inside a box of width \labelwidth (with an \hfil). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

\labelsep: space between end of label box and text of first item.

1.5 Default Values

Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to 0pt. Then, one of the commands \@listi, \@listii, ..., \@listvi is called, depending upon the current level of the list. The \@list ... commands should be defined by the document style. A convention that the document style should follow is to set \leftmargin to \leftmargini, ..., \leftmarginvi for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset. *Historical L^AT_EX 2.09 comments (not necessarily accurate any more)*:

120          \endparenv
121      \fi
122 }

```

(End of definition for `\endtrivlist`.)

`\@endparenv` To suppress the paragraph indentation in text immediately following a paragraph-making environment, `\everypar` is changed to remove the space, and `\par` is redefined to restore `\everypar`. Instead of redefining `\par` and `\everypar`, `\@endparenv` was changed to set the `@endpe` switch, letting `\end` redefine `\par` and `\everypar`.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

In 2024 this logic was partially replaced with a new algorithm:

- `\if@endpe` is now set globally to `true` or `false`.
- In addition `\@endptrue` initiates an `\aftergroup` call to `\propagate@doendpe` if it is used inside a group.
- `\propagate@doendpe` in turn checks the status of `\if@endpe` and if that is `true` it calls `\@doendpe` otherwise it does nothing.
- `\@doendpe` in turn calls `\@endptrue` and also makes the necessary changes to `\par` and `\everypar` so that they handle as before any empty line that follows the environment.
- Because of the `\@endptrue` we get another `\aftergroup`, so the mechanism slowly migrates out of several groups if those follow immediately after the end of the environment. If, however, there is a new paragraph started or an explicit `\par` before the next group ends then this will result in a call to `\@endpfalse` and the migration stops (note that `\propagate@doendpe` is still called once after the group but does nothing).
- Using this approach something like

```

{%
  some customization here
  \begin{equation}
    x=y
  \end{equation}
  some text

```

is still correctly identified as a paragraph continuation so that there is no indentation before `some text`.

- We can get away with using global settings of `\if@endpe` even in nested situations (without keeping track of the status in a stack), because the switch change is made only at the very end of such environments, basically directly before the `\endgroup` in `\end`, and it is later set back to `false` by the next `\everypar` or the next `\par`. Even if the environment is called without using `\begin \end`, the situation doesn't change (or rather cause a problem).
- However, there is one scenario where the new approach would change the behavior. If a box is being built, e.g., with `\setbox`, we have now the case that a `\@endpetrue` inside would migrate out into a context in which it should not be true (because the box might get used elsewhere, e.g., a float). In the past, due to local switch changes, that didn't happen, i.e., `\if@endpe` would revert to `false` at the end of the box definition.
- Thus, to avoid that one has to explicitly set it back to false at the end of such constructions, just as we also need to prevent colors from migrating out. Thus the correct place to do this is in `\color@endgroup` because that is always called at that point.

```

123 \def\@endparenv{%

141  </2ekernel>
142  <*2ekernel | latexrelease>
143  <latexrelease>\IncludeInRelease{2024/11/01}%
144  <latexrelease>           {\@endpefalse}{New @endpe handling}%
145  \def\@endpefalse{\global\let\if@endpe\iffalse}
146  \def\@endpetrue {%
147    \global\let\if@endpe\iftrue

```

If we are inside a simple or a semi-simple group then propagate to the outside, for all other group types do nothing. Normally, we would start out in the group opened by `\begin` (type 14). When we migrate out of that we are either on top-level (type 0) or in another semi-simple group (type 14) or in some other group. Thus, the best order of tests is to first test for 14, then for 0 and finally for 1 (simple group).

```

148  \ifnum\currentgroup=14          % semi-simple group
149    \aftergroup\propagate@doendpe
150  \else
151    \ifnum\currentgroup=0          % no group: top-level
152  \else
153    \ifnum\currentgroup=1        % simple group
154      \aftergroup\propagate@doendpe
155    \fi
156    \fi
157  \fi
158 }

```

If `\if@endpe` is still true after the group ends, we run `\@doendpe` that in turn runs another `\@endpetrue` (besides other things), thus propagating further if necessary. However, if the endpe situation got resolved and `\if@endpe` is `false` then nothing further happens.

```

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a `kern` to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in `raggedright` setting. If `\noindent` was used after `\item` want

to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```

216      {\setbox\z@\lastbox
217      \ifvoid\z@
218          \kern-\itemindent
219      \fi}%
220      \box\@labels
221      \penalty\z@
222  \fi

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `\nobreak` when it is true is now essential since now it is sometimes set locally.

```

223  \if@nobreak
224      \nobreakfalse
225      \clubpenalty \z@M

1.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```
\def\theenumi{\alph{enumi}}  
\def\p@enumi{\theenumi}  
\def\labelenumi{(\theenumi)}
```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `•`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@enumspacing` and `\@enumdepth`.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
\enumerate ==  
  BEGIN  
    if \@enumdepth > 3  
      then errormessage: "Too deeply nested".  
      else \@enumdepth :=L \@enumdepth + 1  
            \@enumctr :=L eval(enum@\romannumeral\the\@enumdepth)  
            \list{\label(\@enumctr)}  
                  {\usecounter{\@enumctr}  
                   \makelabel{LABEL} == \hss \llap{LABEL}}  
    fi  
  END
```

```
\endenumerate == \endlist
```

ltboxes.dtx

1 L^AT_EX Box commands

\makebox \makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}
Puts ⟨obj⟩ in an \hbox of width ⟨wid⟩, positioned by ⟨pos⟩.
The possible ⟨pos⟩ are:
s stretched,
l flushleft,
r flushright,
c (default) centred.
If ⟨wid⟩ is missing, then ⟨pos⟩ is also missing and ⟨obj⟩ is put in an \hbox of its natural width.

\makebox⟨x⟩,⟨y⟩[⟨pos⟩]{⟨obj⟩}
Puts ⟨obj⟩ in an \hbox of width $x * \unitlength$ and height $y * \unitlength$. ⟨pos⟩ arguments are s, l, r or c (default) for stretched, flushleft, flushright or centred, and t or b for top, bottom – or combinations like tr or rb. Default for horizontal and vertical are centered. Note that in this picture mode version of \makebox a [b] aligns on the *bottom* of the text as documented. If you want to align on the *baseline* use \makebox(,)[b]{\raisebox{0pt}[height][0pt]{xyz}} or \makebox(,)[b]{\smash{xyz}}

\mbox \mbox{⟨obj⟩} The same as \makebox{⟨obj⟩}, but is more efficient as no checking for optional arguments is done.

\newsavebox \newsavebox{⟨cmd⟩} : If ⟨cmd⟩ is undefined, then defines it to be a T_EX box register.

\savebox \savebox{⟨cmd⟩} ... : ⟨cmd⟩ is defined to be a T_EX box register, and the '...' are any \makebox arguments. It is like \makebox, except it doesn't produce text but saves the value in \box ⟨cmd⟩.

\sbox \sbox{⟨cmd⟩}{⟨obj⟩} is an efficient abbreviation for \savebox{⟨cmd⟩}{⟨obj⟩}.

\lrbox (env.) \begin{lrbox}{⟨cmd⟩}{⟨text⟩}\end{lrbox} is equivalent to \sbox{⟨cmd⟩}{⟨text⟩} except that any white space at the beginning and end of ⟨text⟩ is ignored.

\framebox \framebox ... : like \makebox, except it puts a 'frame' around the box. The frame is made of lines of thickness \fboxrule, separated by space \fboxsep from the text – except for \framebox(X,Y) ... , where the thickness of the lines is as for the picture environment, and there is no separation added.

\fbox \fbox{⟨obj⟩} is an abbreviation for \framebox{⟨obj⟩}.

\parbox \parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩} : Makes a box with \hsize ⟨width⟩, positioned by ⟨pos⟩ as follows: c : \vcenter (placed in \$...\$ if not in math mode) b : \vbox t : \vtop default value is c. Sets \hsize := ⟨width⟩ and calls \parboxrestore, which does the following: Restores the original definitions of:
\par
\
\-
\'
\`
\=

Resets the following parameters:

```

\parindent      = 0pt
\parskip       = 0pt
\linewidth     = \hsize
\@totalleftmargin = 0pt
\leftskip      = 0pt
\rightskip     = 0pt
\@rightskip    = 0pt
\parfillskip   = 0pt plus 1fil
\lineskip      = \normallineskip
\baselineskip  = \normalbaselineskip

```

Calls `\sloppy`

Note: `\arrayparboxrestore` same as `\parboxrestore` but it doesn't restore `\`.`.

`minipage (env.)` `minipage` : Similar to `\parbox`, except it also makes this look like a page by setting `\textwidth == \columnwidth == box width` changes footnotes by redefining:

```

\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext

```

resets the following list environment parameters:

```

\@listdepth == \@mplistdepth

```

where `\@mplistdepth` is initialized to zero,

and executes `\minipagerestore` to allow the document style to reset any other parameters it desires. It sets `@minipage` true, and resets `\everypar` to set it false. This switch keeps `\addvspace` from putting space at the top of a minipage.

Change added 24 May 89: `\minipage` sets `@minipage` globally; `\endminipage` resets it false.

`\rule` `\rule[raised]{width}{height}` : Makes a $\langle width \rangle * \langle height \rangle$ rule, raised *raised*.

`\underline` `\underline{\text{...}}` : Makes an underlined hbox with `\text{...}` in it.

`\raisebox` `\raisebox{distance}[height][depth]{box}` : Raises `\box` up by *distance* length (down if *distance* negative). Makes TeX think that the new box extends *height* above the line and *depth* below, for a total vertical length of *height*+*depth*. Default values of *height* & *depth* = actual height and depth of box in new position.

```

(End of definition for `\@iiiparbox` and `\@parboxto`.)

`\@arrayparboxrestore` Restore various paragraph parameters.

The rational for allowing two normally global flags to be set locally here was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\@setnobreak`; otherwise this command will be redundant.

591   \box\@tempboxa
592 } \end{tempboxa}
```

(End of definition for \@iirsbox.)

\@finalstrut This macro adds a special strut the *depth* of the box given as #1, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect \prevdepth to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns.

The \nobreak was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

In 2024 we changed the macro to account for vertical mode. In that case we use a strut produced with \rule to avoid starting a new paragraph (resulting in spurious extra line) and also account for the \prevdepth of the previous line.

```
593 </2ekernel>
594 <*2ekernel | latexrelease>
595 <latexrelease>\IncludeInRelease{2024/06/01}%
596 <latexrelease>           {\@finalstrut}{final strut correction}%
597 \def\@finalstrut#1{%
598   \unskip
599   \ifhmode \nobreak
600   \else
```

If we are in vmode we now back up by a baseline.

```
601     \vskip-\baselineskip  
602     \fi
```

Finally we unconditionally use `\vrule`.

```
603     \vrule\@width\z@\@height\z@\@depth\dp#1}  
604     </2ekernel | latexrelease>  
605     <latexrelease>\EndIncludeInRelease  
606     <latexrelease>\IncludeInRelease{0000/00/00}%  
607     <latexrelease>           {\@finalstrut}{final strut correction} %  
608     <latexrelease>\def\@finalstrut#1{ %  
609     <latexrelease> \unskip\ifhmode\nobreak\fi  
610     <latexrelease> \vrule\@width\z@\@height\z@\@depth\dp#1}  
611     <latexrelease>  
612     <latexrelease>\EndIncludeInRelease  
613     <*2ekernel>
```

(*End of definition for `\@finalstrut`.*)

1.1 Some low-level constructs

The following commands are basically inherited from plain TeX.

```
\leftline These macros place text on a full line either centred or left or right adjusted.  
\rightline 614 \def\@cline{\hb@xt@{\hsize}  
\centerline 615 \ DeclareRobustCommand\leftline[1]{\@cline{\#1\hss}}  
 \@@line 616 \ DeclareRobustCommand\rightline[1]{\@cline{\hss\#1}}  
 617 \ DeclareRobustCommand\centerline[1]{\@cline{\hss\#1\hss}}
```

(*End of definition for `\leftline` and others.*)

```
\rlap These macros place text to the left or right of the current reference point without taking  
\llap up space.  
\clap 618 \ DeclareRobustCommand\rlap[1]{\hb@xt@{\z@{\#1\hss}}}  
 619 \ DeclareRobustCommand\llap[1]{\hb@xt@{\z@{\hss\#1}}}
```

And here is the version that centers, it was initially introduced by `mathtools`.

```
620 \ DeclareRobustCommand\clap[1]{\hb@xt@{\z@{\hss\#1\hss}}}
```

(*End of definition for `\rlap`, `\llap`, and `\clap`.*)

```
621 </2ekernel>
```

1 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L^AT_EX 2.09 version, not the extended version described in *The L^AT_EX Companion*. Use the `array` package to obtain the extended version.

1.1 tabbing

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
\dimen(\@firsttab + i) = distance of tab stop i from left margin
  0 <= i <= 15 (?).

\dimen\@firsttab is initialized to \totallmargin, so it starts
  at the prevailing left margin.

\@maxtab      = number of highest defined tab register
  probably = \@firsttab + 12
\@nxttabmar = tab stop number of next line's left margin
\@curtabmar = tab stop number of current line's left margin
\@curtab    = number of the current tab. At start of line,
  it equals \@curtabmar
\@hightab   = largest tab number currently defined.
\@tabpush   = depth of \pushtab's

\box\@curline = contents of current line, excluding left margin
  skip, and excluding contents of current field
\box\@curfield = contents of current field

@rjfield     = switch: T iff the last field of the line should
  be right-justified at the right margin.

\tabbingsep  = distance left by the \` command between the
  current position and the field that is
  “left-shifted”.

UTILITY MACROS
\@stopfield : closes the current field
\@addfield  : adds the current field to the current line.
\@contfield : continues the current field
\@startfield: begins the next field
\@stopline   : closes the current line and outputs it
```

```

\@startline : starts the next line
\@ifatmargin : an \if that is true iff the current line.
                 has width zero

1.2 array and tabular environments

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

ARRAY PARAMETERS:

\arraycolsep	: half the width separating columns in an array environment
\tabcolsep	: half the width separating columns in a tabular environment
\arrayrulewidth	: width of rules
\doublerulesep	: space between adjacent rules in array or tabular
\arraystretch	: line spacing in array and tabular environments is done by placing a strut in every row of height and depth \arraystretch times the height and depth of the strut produced by an ordinary \strut command.

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

l,r,c	: indicate where entry is to be placed.
	: for vertical rule
@{EXP}	: inserts the text EXP in every column. \arraycolsep or \tabcolsep spacing is suppressed.
*{N}{PRE}	: equivalent to writing N copies of PRE in the preamble. PRE may contain *{N'}{EXP'} expressions.
p{LEN}	: makes entry in parbox of width LEN.

SPECIAL ARRAY COMMANDS:

\multicolumn{N}{FORMAT}{ITEM} : replaces the next N column items by ITEM, formatted according to FORMAT.
 FORMAT should contain at most one l,r or c.
 If it contains none, then ITEM is ignored.

\vline : draws a vertical line the height of the current row. May appear in an array element entry.

\hline : draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a \\ command. If followed by another \hline, then adds a \vskip of \doublerulesep.

\cline{i-j} : draws horizontal lines between rows covering columns i through j, inclusive. Multiple commands may follow one another to provide lines covering several disjoint columns

\extracolsep{WIDTH} : for use inside an @ in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

```
184 \bgroup
```

This next bit of code sets up the strut and then builds the `halign` and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the `\@arstrut` below is expanded and contains an `\ifmmode` then it could produce an unnecessary extra box in every row, thus wasting ‘lots of’ main memory.

```
185 \setbox\@arstrutbox\hbox{%
186   \vrule \height\arraystretch\ht\strutbox
187   \depth\arraystretch \dp\strutbox
188   \width\z@\%
189   \mkpream{#2}%
190   \edef\@preamble{%
191     \ialign \noexpand\@halignto
192       \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%
193 }
```

That is the end of setting up the preamble; now we reset things before executing the `halign` built-up in `\@preamble`. The restorations could be done by introducing an extra group, thus saving tokens.

```
193 \let\@startpbox\@startpbox \let\@endpbox\@endpbox
194 \let\tabularnewline\\%
195   \let\par\empty
196   \let\sharp##%
197   \set@typeset@protect
198   \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there may be some characters left which TeX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the `\halign` expects vertical mode thus issues a `\par` but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

\carstrut
\preamble
\endgroup
END
```

End of historical L^AT_EX 2.09 comments.

The command \def\caddamp{} was removed from \multicolumn on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the \multicolumn command had two column specifiers.

8 Feb 89 — \hbox{} added after \preamble to correct bug that occurred if \multicolumn preceded \\[D] with D > 0, caused by \\[] command doing an \unskip, which removed \tabcolsep glue inserted by \multicolumn.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

Codes for classes and character numbers of array, tabular and multicolumn arguments.

Character	Class	Number
c	0	0
l	0	1
r	0	2
	1	-
@	2	-
p	3	-
{@-exp}	4	-
{p-arg}	5	-

\@testpach \foo : expands \foo, which should be an array parameter

token, and sets \chclass and \chnum to its class and number. Uses \lastchclass to distinguish 4 and 5

Preamble error codes

- 0: 'illegal character'
- 1: 'Missing @-exp'
- 2: 'Missing p-arg'

The original had `\unskip` at this point, but how could a skip get here ???

```

376 \leaders\hrule\@height\arrayrulewidth\hfill
377 \cr

```

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make `\cline` look ahead for a following `\cline` as does `\hline`. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

```
378 \noalign{\vskip-\arrayrulewidth}}
```

(End of definition for `\cline` and `\@cline`.)

`\mscount` The `\mscount` counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

(End of definition for `\mscount`.)

`\multispan` Modify `\multispan` slightly from its plain T_EX definition to allow more efficient code sharing with `\multicolumn`. Also share a count register with `\multiput`.

```

\sp@n 379 \def\multispan{\omit\@multispan}
380 \def\@multispan#1{%
381   \multicnt#1\relax
382   \loop\ifnum\multicnt>\@ne \sp@n\repeat}
383 \def\sp@n{\span\omit\advance\multicnt\m@ne}

```

(End of definition for `\multispan`, `\@multispan`, and `\sp@n`.)

`\@startpbox` Helper macros for ‘p’ columns.

```

\@endpbox 14 Jan 89)
\@startpbox{(width)} text \egroup is essentially \parbox{(width)}{(text)}
\@endpbox is essentially \unskip \strut \par \egroup\hfil (Changed 14 Jan 89)
(changed again 1994/05/13)

```

```
384 \def\@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}
```

```
385 \def\@endpbox{\@finalstrut\@arstrutbox\par\egroup\hfil}
14 Jan 89: Def of \@endpbox changed from
\def\@endpbox{\par\vskip\dp\@arstrutbox\egroup\hfil}
so vertical spacing works out right if the last line of a ‘p’ entry has a descender.
```

(End of definition for \@startpbox and \@endpbox.)

```
\@@startpbox
\@@endpbox
386 \let\@@startpbox=\@startpbox
387 \let\@@endpbox=\@endpbox
```

(End of definition for \@startpbox and \@endpbox.)

ltpictur.dtx

1 Picture Mode

Picture mode commands. In addition to the commands available in L^AT_EX2.09, This section adds the new \qbezier command for drawing curves.

\qbezier \qbezier[$\langle N \rangle$] ($\langle AX,AY \rangle$) ($\langle BX,BY \rangle$) ($\langle CX,CY \rangle$) plots a quadratic Bezier curve from ($\langle AX,AY \rangle$) to ($\langle CX,CY \rangle$), with ($\langle BX,BY \rangle$) as the third Bezier point, using $N+1$ points equally spaced parametrically. If $N = 0$ (the default value), then a sufficient number of points are used to draw a connected curve—except that at most \qbeziermax+1 points are drawn. A “point” is a square of side \@wholewidth.

\bezier In addition, to be compatible with the old **bezier** package, a variant of this command, \bezier, is defined, in which the first argument is not optional.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

\unitlength	= value of dimension argument
\@wholewidth	= current line width
\@halfwidth	= half of current line width
\@linefnt	= font for drawing lines
\@circlefnt	= font for drawing circles

\linethickness{DIM} : Sets the width of horizontal and vertical lines in a picture to DIM. Does not change width of slanted lines or circles. Width of all lines reset by \thinlines and \thicklines

```
\picture(XSIZE,YSIZE)(XORG,YORG)
BEGIN
  \@picht := L YSIZE * \unitlength
  box \@picbox :=
    \hb@xt@ XSIZE * \unitlength
    {\hskip -XORG * \unitlength
     \lower YORG * \unitlength
     \hbox{
       \ignorespaces      %% added 13 June 89
    }
  END
```

```
\endpicture ==
BEGIN
  } \hss }
height of \@picbox := \@picht
depth of \@picbox := 0
\mbox{\box\@picbox} %% change 26 Aug 91
END
```

```
\put(X, Y){OBJ} ==
BEGIN
```

```

\@killglue
\raise Y * \unitlength \hb@xt@ 0pt { \hskip X * \unitlength
                                         OBJ \hss }
\ignorespaces
END

\multiput(X,Y)(DELX,DELY){N}{OBJ} ==
BEGIN
\@killglue
\@multicnt := N
\@xdim := X * \unitlength
\@ydim := Y * \unitlength
while \@multicnt > 0
  do \raise \@ydim \hb@xt@ 0pt { \hskip \@xdim
                                         OBJ \hss }
\@multicnt := \@multicnt - 1
\@xdim := \@xdim + DELX * \unitlength
\@ydim := \@ydim + DELY * \unitlength
od
\ignorespaces
END

\shortstack[POS]{TEXT} : Makes a \vbox containing TEXT stacked as
a one-column array, positioned l, r or c as indicated by POS.

```

End of historical L^AT_EX 2.09 comments.

The ‘2ekernel’ code ensures that a \usepackage{autopict} is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

1 <2ekernel>\expandafter\let\csname ver@autopict.sty\endcsname\fmtversion

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):
CIRCLES AND OVALS

USER COMMANDS:

\circle{D} : Produces the circle with the diameter as close as possible to D * \unitlength. \put(X,Y){\circle{D}} puts the circle with its center at (X,Y).

\oval(X,Y) : Makes an oval as round as possible that fits in the rectangle of width X * \unitlength and height Y * \unitlength. The reference point is the center.

\oval(X,Y)[POS] : Save as \oval(X,Y) except it draws only the half or quadrant of the oval indicated by POS. E.G., \oval(X,Y)[t] draws just the top half and \oval(X,Y)[br] draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified \oval(X,Y) command.

\@ovvert {DELTA1} {DELTA2} : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical

rule. The width of the box will be `\@tempdima`.
 DELTA1 and DELTA2 are added to the character number in `\@tempcnta` to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval.
 The width of the box will be `\@ovxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number of the top-right quarter circle with the largest diameter less than or equal to DIAM.
 Sets `\@tempboxa` to an hbox containing that character.
 Sets `\@tempdima` to `\wd \@tempboxa`, which is the distance from the circle's left outside edge to its right inside edge.
 (These characters are like those described in the TeXbook, pp. 389-90.)

ltthm.dtx

1 Theorem Environments

The user creates his own theorem-like environments with the command
`\newtheorem{<name>}{<text>}[<counter>]` or
`\newtheorem{<name>}[<oldname>]{<text>}`

This defines the environment `<name>` to be just as one would expect a theorem environment to be, except that it prints `<text>` instead of “Theorem”.

If `<oldname>` is given, then environments `<name>` and `<oldname>` use the same counter, so using a `<name>` environment advances the number of the next `<name>` environment, and vice-versa.

If `<counter>` is given, then environment `<name>` is numbered within `<counter>`.
E.g., if `<counter> = subsection`, then the first `<name>` in subsection 7.2 is numbered `<text> 7.2.1`.

The way `<name>` environments are numbered can be changed by redefining `\the<name>`.
Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

DOCUMENT STYLE PARAMETERS

`\@thmcOUNTER` : A command such that
`\edef\theCOUNTER{\@thmcOUNTER{COUNTER}}`
defines `\theCOUNTER` to produce a number for a theorem environment.
The default is:

BEGIN `\noexpand\arabic{COUNTER}` END

`\@thmcOUNTERsep` : A separator placed between a theorem number and
the number of the counter within which it is numbered.
E.g., to make the third theorem of section 7.2 be numbered
7.2-3, `\@thmcOUNTERsep` should be `\def`'`. Its
default is `”`.

`\@begintheorem{NAME}{NUMBER}` : A command that begins a theorem
environment for a ‘theorem’ named ‘NAME NUMBER’ –
e.g., `\@begintheorem{Lemma}{3.7}` starts Lemma 3.7.

`\@opargbegintheorem{NAME}{NUMBER}{OPARG}` :
A command that begins a theorem
environment for a ‘theorem’ named ‘NAME NUMBER’ with optional
argument OPARG – e.g., `\@begintheorem{Lemma}{3.7}{Jones}`
starts ‘Lemma 3.7 (Jones):’.

`\@endtheorem` : A command that ends a theorem environment.

`\newtheorem{NAME}{TEXT}[COUNTER] ==`
BEGIN
if `\NAME` is definable

```

then \@definecounter{NAME}
    if COUNTER present
        then \@newctr{NAME}[COUNTER] fi
            \theNAME == BEGIN \theCOUNTER \@thmcOUNTERsep
                eval\@thmcOUNTER{NAME} END
            else \theNAME == BEGIN eval\@thmcOUNTER{NAME} END
                \NAME == \@thm{NAME}{TEXT}
                \endNAME == \@endtheorem
            else error
        fi
    END

\newtheorem{NAME}[OLDNAME]{TEXT} ==
BEGIN
    if counter OLDNAME nonexistent
        then ERROR
    else
        if \NAME is definable
            then BEGIN
                \theNAME == \theOLDNAME
                \NAME == \@thm{OLDNAME}{TEXT}
                \endNAME == \@endtheorem
            END
        else error
    fi
END

\@thm{NAME}{TEXT} ==
BEGIN
    \@refstepcounter{NAME}
    if next char =
        then \@ythm{NAME}{TEXT}
        else \@xthm{NAME}{TEXT}
    fi
END

\@xthm{NAME}{TEXT} ==

ltsect.dtx

1 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L^AT_EX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1  {*2ekernel}
2  \message{title,}
```

1.1 The Title

`\title` The user defines the title and author by the declarations `\title{<name>}`, `\author{<name>}`.
`\author` Similarly the date is declared with `\date{<date>}`.
`\date` Inside these, the `\thanks{<footnote text>}` command may be used to make acknowledgements, notice of address, etc. in a footnote. If there are multiple authors, they have `\and` to be separated with the `\and` command.
`\maketitle` And finally, the `\maketitle` command produces the actual title, using the information previously saved with the other commands.

```
3  /2ekernel
4  {*2ekernel | latexrelease}
5  {latexrelease}\IncludeInRelease{2019/10/01}%
6  {latexrelease}           {\title}{Make commands robust}%
```

`\title` `\title` for use in `\maketitle`. If not given `\maketitle` will produce an error message.
7 `\DeclareRobustCommand\title[1]{\gdef\@title{\#1}}`

(End of definition for `\title`. This function is documented on page 810.)

`\author` `\author` for use in `\maketitle`. If not given `\maketitle` will produce a warning message.
8 `\DeclareRobustCommand*\author[1]{\gdef\@author{\#1}}`

(End of definition for `\author`.)

`\date` `\date` for use in `\maketitle`. If not given `\maketitle` will produce `\today` as the default.

```
9 \DeclareRobustCommand*\date[1]{\gdef\@date{\#1}}
```

(End of definition for `\date`.)

`\thanks`
10 `\DeclareRobustCommand\thanks[1]{\footnotemark}`
11 `\protected\@xdef\@thanks{\@thanks`
12 `\protect\footnotetext[\the\c@footnote]{\#1}}%`
13 }

(End of definition for `\thanks`.)

```

\and
14 \DeclareRobustCommand{\and}{%
15   \end{tabular}%
16   \hskip 1em \oplus .17fil%
17   \begin{tabular}[t]{c}}%      \end{tabular}

35 \message{sectioning,}

```

1.2 Sectioning

```

\@secpenalty
36 \newcount\@secpenalty
37 \@secpenalty = -300

(End of definition for \@secpenalty.)

\if@noskipsec Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the
\@noskipsectrue preamble and to false in \document. This was done to trap lists and related text in the
preamble but it does not catch everything.
38 \newif\if@noskipsec \@noskipsectrue

```

(End of definition for \if@noskipsec and \@noskipsectrue.)

\@startsection The \@startsection{\{name\}}{\{level\}}{\{indent\}}{\{beforeskip\}}{\{afterskip\}}{\{style\}}*{\{altheading\}}{\{heading\}} command is the mother of all the user level sectioning commands. The part after the *, including the * is optional.

name: e.g., 'subsection'

level: a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

indent: Indentation of heading from left margin

beforeskip: Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

afterskip: if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

style: Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as \MakeUppercase or \fbox that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, \bfseries\MakeUppercase would produce bold, uppercase headings.

If '*' is missing, then increment the counter. If it is present, then there should be no [*altheading*] argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

Warning: The \@startsection command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
          \par ...
          \endgroup}
```

Pseudocode for the \@startsection command *Historical L^AT_EX 2.09 comments* (not necessarily accurate any more):

```

(End of definition for \sectionmark and others.)

148 \message{contents,}

1.3 Table of Contents etc.

1.3.1 Convention

\tf@*foo* = file number for output for table foo. The file is opened only if @filesw = true.

1.3.2 Commands

A \l@*type*{*entry*}{*page*} Macro needs to defined by document style for making an entry of type *type* in a table of contents, etc. E.g., the document style should define \l@chapter, \l@section, etc.

Note: When the \protect command is used in the *entry* or *text* of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an \addcontentsline or \addtocontents command argument, the commands: \index, \glossary, and \label are no-ops . This could cause a problem if the user puts an \index or \label into one of the commands he writes, or into the optional ‘short version’ argument of a \section or \caption command.

\starttoc The \starttoc{*ext*} command is used to define the commands:
\tableofcontents, \listoffigures, etc.

For example: \starttoc{lof} is used in \listoffigures. This command reads the .*ext* file and sets up to write the new .*ext* file.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

\starttoc{EXT} ==

```

BEGIN
  \begingroup
    \makeatletter
    read file \jobname.EXT
    IF @filesw = true
      THEN open \jobname.EXT as file \tf@EXT
    FI
    @nobreak :=G FALSE %% added 24 May 89
  \endgroup
END

```

End of historical L^AT_EX 2.09 comments.

```

149 \def\@starttoc#1{%
150   \begingroup
151     \makeatletter

156     \fi
157     \nobreakfalse
158   \endgroup}

```

(End of definition for \@starttoc.)

\addcontentsline The \addcontentsline{\table}{\type}{\entry} command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry \contentsline{\type}{\entry}{\page}{\empty} to the .\table file.

This macro is implemented as an application of \addtocontents. Note that \thepage is not expandable during \protected@write therefore one gets the page number at the time of the \shipout.

```

208  \end{macro}

```

(End of definition for `\addtocontents`.)

\contentsline The \contentsline{\langle type \rangle}{\langle entry \rangle}{\langle page \rangle}{} macro produces a \langle type \rangle entry in a table of contents, etc. It will appear in the .toc or other file. For example, the entry for subsection 1.4.3 in the table of contents, might be produced by:

```
\contentsline{subsection}
{\numberline{1.4.3}Gnats and Gnus}{22}{}
```

The \protect command causes command sequences to be written without expanding them.

```
209 </2ekernel>
210 <*2ekernel | latexrelease>
211 <latexrelease>\IncludeInRelease{2021/11/15}%
212 <latexrelease>          {\contentsline}{Four arguments}%
```

In the toc file \contentsline is followed by 4 arguments these days, but only the first 3 are used in the old interface. The fourth was by default empty and only used when hyperref was loaded. We now pick up all 4 arguments, save the last one away in \@contentsline@destination and then call the old interface. This is done to simplify the interface to hyperref and to prepare for future changes.

```
213 \def\contentsline#1#2#3#4{\gdef\@contentsline@destination{#4}%

270 <latexrelease>\let\noprotusion\undefined
271 <latexrelease>\EndIncludeInRelease
272 <*2ekernel>

```

Note: \nobreak's added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use \leftskip instead of \hangindent so leaders of multiple-line contents entries would line up properly.

\numberline \numberline{\langle number\rangle}: For use in a \contentsline command. It puts \langle number\rangle flush-left in a box of width \c@tempdima (Before 25 Jan 88 change, it also added \c@tempdima to the hanging indentation.)

```

273 \def\numberline#1{\hb@xt@\c@tempdima{#1\hfil}}
274 </2ekernel>

```

(End of definition for \numberline.)

File 45

ltfloat.dtx

1 Floats

The different types of floats are identified by a `<type>` name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each `<type>` has associated a positive `<type number>`, which is a power of two. E.g.,

figures might be have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a `<placement specifier>`, which is a list of the possible locations, each denoted by a letter as follows:

- h : here — at the current location in the text.
- t : top — at the top of a text page.
- b : bottom — at the bottom of a text page.
- p : page — on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

1.1 Floating Environments

```
1  <*2ekernel>
2  \message{floats,}
```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

```
\c@topnumber      : Number of floats allowed at the top of a column.
\topfraction     : Fraction of column that can be devoted to floats.
\cdbltopnumber, \dbltopfraction
                  : Same as above, but for double-column floats.
\c@bottomnumber, \bottomfraction
                  : Same as above for bottom of page.
\c@totalnumber   : Number of floats allowed in a single column,
                  including in-text floats.
{textfraction}   : Minimum fraction of column that must contain text.
{floatpagefraction}: Minimum fraction of page that must be taken
                   up by float page.
{dblfloatpagefraction}
                  : Same as above, for double-column floats.
```

The document style must define the following.

```
\fps@TYPE    : The default placement specifier for floats of type
                TYPE.

\ftype@TYPE  : The type number for floats of type TYPE.

\ext@TYPE    : The file extension indicating the file on which the
                contents list for float type TYPE is stored.
                For example, \ext@figure = 'lof'.

\fnum@TYPE   : A macro to generate the figure number for a caption.
                For example, \fnum@TYPE == Figure \thefigure.

\@makecaption{NUM}{TEXT} :
                A macro to make a caption, with NUM the value
                produced by \fnum@... and TEXT the text of the caption.
                It can assume it's in a \parbox of the appropriate width.

\@float{TYPE}[PLACEMENT] : This macro begins a float environment for a
                single-column float of type TYPE with PLACEMENT as the placement
                specifier. The default value of PLACEMENT is defined by
                \fps@TYPE. The environment is ended by \end@float.
                E.g., \figure == \@float{figure}, \endfigure == \end@float.

\@float{TYPE}[PLACEMENT] ==

\addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
\begingroup
\@parboxrestore
\@normalsize
\@makecaption{\fnum@TYPE}{TEXT}
\par
\endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'. The environment is ended by `\end@dblfloat`.
E.g., `\figure*` == `\@dblfloat{figure}`,
`\endfigure*` == `\end@dblfloat`.

```

\@dblfloat{TYPE}[PLACEMENT] ==
Identical to \@float{TYPE}[PLACEMENT] except \hsize and \linewidth
are set to \textwidth.
End of historical LATEX 2.09 comments.

```

```
\@floatpenalty
 3 \newcount\@floatpenalty
```

(End of definition for `\@floatpenalty`.)

`\caption` This is set to be an error message outside a float since no `capttype` is defined there; this may need to be changed by some classes.

```

4  \def\caption{%
5   \ifx\@capttype\undefined
6     \@latex@error{\noexpand\caption outside float}\@ehd
7     \expandafter\@gobble
8   \else
9     \refstepcounter\@capttype
10    \expandafter\@firstofone
11   \fi
12 { \@dblarg{\@caption\@capttype} }%
13 }

```

(End of definition for `\caption`.)

`\@caption`

```

14 \long\def\@caption#1[#2]#3{%
15   \par
16   \addcontentsline{\csname ext@\#1\endcsname}{\#1}%
17   {\protect\numberline{\csname the\#1\endcsname}{\ignorespaces #2}}%
18   \begingroup

```

The paragraph setting parameters are normalised at this point, however `\@parboxrestore` resets `\everypar` which is not correct in this context so `\@setminipage` is called if needed.

The float mechanism, like `minipage`, sets the flag `@minipage` true before executing the user-supplied text. Many L^AT_EX constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates T_EX's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of `\everypar`, but the call to `\@parboxrestore` removes that redefinition, so it is re-inserted if needed. If the flag is already false then the `\caption` was not the first entry in the float, and so some other paragraph has already activated the special `\everypar`. In this case no further action is needed.

```

19   \@parboxrestore
20   \if@minipage
21     \@setminipage
22   \fi
23   \normalsize
24   \makecaption{\csname fnum@\#1\endcsname}{\ignorespaces #3}\par
25 \endgroup

```

(End of definition for `\@caption`.)

`\@float`

```

29     {\edef\reserved@a{\noexpand\@xfloat{\#1}[\csname fps@\#1\endcsname]}%
30      \reserved@a}

```

(End of definition for `\@float` and `\@dblflset`.)

`\@dblfloat`

```

31 \def\@dblfloat{%
32   \if@twocolumn\let\reserved@a\@dbfl\else\let\reserved@a\@float\fi
33   \reserved@a}

```

(End of definition for \@dblfloat.)

\fps@dbl Note that all double floats have default fps ‘tp’.

(End of definition for \fps@dbl.)

\@setfps This sets the fps, dealing with error conditions by adding the default.

(End of definition for \@setfps.)

\@xfloat The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters.

It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

\@floatboxreset The rational for allowing these normally global flags to be set locally here, via \parboxrestore, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \setnobreak; otherwise this command will be redundant.

307 
```

(End of definition for \dblfloatplacement.)

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the \output routine. Marginal notes are distinguished from floats by having a negative placement specification. The command \marginpar [LTEXT]{RTEXT} generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

```
\marginparwidth : Width of marginal notes.  
\marginparsep  : Distance between marginal note and text.  
                  the page layout to determine how to move the marginal  
                  note into the margin. E.g., \leftmarginskip ==  
                  \hskip -\marginparwidth \hskip -\marginparsep .  
\marginparpush : Minimum vertical separation between \marginpar's
```

Marginal notes are normally put on the outside of the page if @mparswitch = true, and on the right if @mparswitch = false. The command \reversemarginpar reverses the side where they are put. \normalmarginpar undoes \reversemarginpar. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```
\marginpar [LTEXT]{RTEXT} ==

(End of definition for `\@savemarbox`.)

`\marginparreset` The rational for allowing these normally global flags to be set locally here, via `\parboxrestore` was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\setnobreak`; otherwise this command will be redundant.

```

 370 \def \marginparreset {%

```

1.2 Footnotes

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

\footnote{NOTE} : User command to insert a footnote.

\footnote[*NUM*]{*NOTE*} : User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered *, **, etc. within pages, then \footnote[2]{...} produces footnote **. This command does not step the footnote counter.

\footnotemark[*NUM*] : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

\footnotetext[*NUM*]{*TEXT*} : Command to produce the footnote but no mark. \footnote is equivalent to \footnotemark \footnotetext .

As in PLAIN, footnotes use \insert\footins, and the following parameters:

\footnotesize : Size-changing command for footnotes.

\footnotesep : The height of a strut placed at the beginning of every footnote.

\skip\footins : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height **\footnotesep** which is at the beginning of the first footnote.

\footnoterule : Macro to draw the rule separating footnotes from text. It is executed right after a **\vspace** of **\skip\footins**. It should take zero vertical space—i.e., it should skip to a negative value to compensate for any positive space it occupies. (See PLAIN.TEX.)

\interfootnotelinepenalty : Interline penalty for footnotes.

\thefootnote : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an **\@addtoreset** command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

\@thefnmark : Holds the current footnote's mark—e.g., **\dag** or '1' or 'a'.

\@mpfnnumber : A macro that generates the numbers for **\footnote** and **\footnotemark** commands. It == **\thefootnote** outside a **minipage** environment, but can be changed inside to generate numbers for **\footnote**'s.

\@makefnmark : A macro to generate the footnote marker from **\@thefnmark**. The default definition was **\hbox{\$^{\@thefnmark}\$}**.

This is now replaced by
 $\text{\textsuperscript}{\@thefnmark}$

\@makefntext{NOTE} :

Must produce the actual footnote, using **\@thefnmark** as the mark of the footnote and NOTE as the text. It is called when effectively inside a **\parbox**, with **\hsize = \columnwidth**. For example, it might be as simple as
 $\$^{\@thefnmark}\$ \text{ NOTE}$

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

(a) they use the counter `mpfootnote`
(b) the footnotes they produce go at the bottom of the minipage.
The switch is accomplished by letting `\mpfn == footnote` or `mpfootnote` and `\thempfn == \thefootnote` or `\thempfootnote`, and by redefining `\footnotetext` to be `\mpfootnotetext` in the minipage.

```
\footnote{NOTE} ==
BEGIN
  \stepcounter{\@mpfn}
  begingroup
    \protect == \noexpand
    \@thefnmark :=G eval (\thempfn)
  endgroup
  \@footnotemark
  \@footnotetext{NOTE}
END

\footnote[NUM]{NOTE} ==

ltbibl.dtx

1 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The BIBTEX program will create a file containing such an environment, which will be read in by the `\bibliography` command. With BIBTEX, the following commands will be used.

`\bibliography{<file1,<file2, ...,<filen>}` : specifies the bibdata files. Writes a `\bibdata` entry on the `.aux` file and tries to read in `mainfile.bbl`.

`\bibliographystyle{<style>}` : Writes a `\bibstyle` entry on the `.aux` file.
The `thebibliography` environment is a list environment. To save the use of an extra counter, it should use `enumiv` as the item counter. Instead of using `\item`, items in the bibliography are produced by the following commands:

`\bibitem{<name>}` : Produces a numbered entry cited as `<name>`.

`\bibitem[<label>]{<name>}` : Produces an entry labeled by `<Label>` and cited by `<name>`.

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

`\cite` Entries are cited by the command `\cite{<name>}`.

`\nocite{<citations>}` puts information on the `.aux` file that causes BIBTEX to include the `{<citations>}` list in the bibliography, but puts nothing in the text.

`\nocite{*}` is special: it tells BIBTEX to put the whole of a collection of references into the bibliography.

1 `(*2ekernel)`
2 `\message{bibliography,}`

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

PARAMETERS

`\@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}` command, where entry FOOi is defined by `\bibitem[LABELi]{FOOi}`.

The switch `@tempswa` is true if the optional NOTE argument is present.

The default definition is :

```
\@cite{LABELS}{NOTE} ==
BEGIN [LABELS
      IF @tempswa = T THEN , NOTE FI
      ]
END
```

`\@biblabel` : A macro to produce the label in the bibliography entry. For `\bibitem[LABEL]{NAME}`, the label is

generated by `\@biblabel{LABEL}`. It has the default definition `\@biblabel{LABEL} -> [LABEL]`.

CONVENTION

`\b@FOO` : The name or number of the reference created by `\cite{FOO}`
E.g., if `\cite{FOO} -> [17]`, then `\b@FOO -> 17`.

End of historical L^AT_EX 2.09 comments.

16 \DeclareRobustCommand\cite{%
17   \@ifnextchar [{\@tempswattrue\@citex@checkblank}{\@tempswafalse\@citex@checkblank[]}}}
```

Due to the way `\@for` as used in `\@citex` behaves an empty argument to `\cite` did not produce any warning for a missing citation. So we now inject a command before calling `\@citex` that does the checking for us. It is not done in `\@citex` directly, because that command is altered by a number of packages/classes and this way it is more likely that the check survives.

```
18 \def\@citex@checkblank[#1]{%
19   \IfBlankTF {#2}{%
20     {\@citex[#1]{\space}}{%
21       {\@citex[#1]{#2}}{%
22     }%
23   }%
24 }
```

```

24  ⟨latexrelease⟩\EndIncludeInRelease
25  ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
26  ⟨latexrelease⟩                                {\cite}{check for blank}%
27  ⟨latexrelease⟩
28  ⟨latexrelease⟩\DeclareRobustCommand\cite{%
29  ⟨latexrelease⟩  \@ifnextchar [{\@tempswatrue\@citex}{\@tempswafalse\@citex[]}}%
30  ⟨latexrelease⟩\let\@citex@checkblank\@undefined
31  ⟨latexrelease⟩
32  ⟨latexrelease⟩\EndIncludeInRelease
33  {*2ekernel}

```

(End of definition for `\cite`.)

`\@citex` \penalty\@m added to definition of `\@citex` to allow a line break after the ‘,’ in citations like [Jones80,Smith77] (Added 23 Oct 86)
space added after the ‘,’ (21 Nov 87)

```

34  \def\@citex[#1]{\leavevmode
35    \let\@citea\@empty
36    \@cite{\@for\@citere:=#2\do
37      {\@citea\def\@citea{,\penalty\@m\ }}%
38      \edef\@citere{\expandafter\@firstofone\@citere\@empty}%
39      \if@filesw\immediate\write\@auxout{\string\citation{\@citere}}\fi

```

Using `\hbox` instead of `\mbox` is fine because of the `\leavevmode` above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arseneau. Note that this one is inside the first argument of the `\@cite` hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

40    \@ifundefined{b@\@citere}{\hbox{\reset@font\bfseries ?}}%
41    \G@refundefinedtrue
42    \@latex@warning
43      {Citation ‘\@citere’ on page \thepage \space undefined}%
44      {\@cite@ofmt{\csname b@\@citere\endcsname}}}\#1}}

```

(End of definition for `\@citex`.)

```

\bibdata
\bibstyle 45 \let\bibdata=\@gobble
46 \let\bibstyle=\@gobble

```

(End of definition for `\bibdata` and `\bibstyle`.)

```

\bibliography
47 \def\bibliography#1{%
48   \if@filesw
49     \immediate\write\@auxout{\string\bibdata{\zap@space#1 \@empty} }%
50   \fi
51   \@input{\jobname.bbl}

```

(End of definition for \bibliography.)

```
\bibliographystyle
52 \def\bibliographystyle#1{%

57     \immediate\write\auxout{\string\bibstyle{#1}}%
58   \fi}}
```

(End of definition for \bibliographystyle.)

\nocite (Added 14 Jun 85)

This puts information on the .aux file that causes BIBTEX to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for \nocite like that for \@citet, to get rid of leading spaces.

```
59 </2ekernel>
60 <*2ekernel | latexrelease>
61 <| latexrelease>\IncludeInRelease{2021/06/01}%
62 <| latexrelease>           {\nocite}{Allow nocite in preamble}%
63 \def\nocite#1{\@bsphack
```

With the implementation designed already in LATEX 2.09 the \nocite command will not work before \begin{document} since it tries to write to the .aux file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

[This would be easy to fix, but then a document using the fix will silently fail on an older release of LATEX, missing all citations done with \nocite. Thus we do only generate an error message and leave the fix for a LATEX 2 ε successor.]

Given that we are now a quarter century into using LATEX 2 ε there is no good reason any more do limit ourself to 2.09 considerations. So we now simply delay the \nocite if it is issued in the preamble.

```
64 \ifx\@onlypreamble\document
```

Since we are after \begin{document} we can do the citations:

```
65 \@for\@citeb:=#1\do{%
66   \edef\@citeb{\expandafter\@firstofone\@citeb}%
67   \if@filesw\immediate\write\auxout{\string\citation{\@citeb}}\fi
68   \@ifundefined{b@\@citeb}{\G@refundefinedtrue
69     \G@warning{Citation ‘\@citeb’ undefined}}{}%
70 }
```

But before \begin{document} we raised an error message in the past but as of 2021/05 not any longer.

```
71 \% \@latex@error{Cannot be used in preamble}\@eha
```

Instead we delay the declaration to the start of the document. We have to use a late hook for this, so that it comes after the .aux file is open for writing and after \@preamblecmds was executed to change the above test. Therefore \AtBeginDocument would still be too early.

```
72 \AddToHook{begindocument/end}[kernel]{\nocite{#1}}%
73 \fi
```

```

74   \@esphack}
75   {/2ekernel | latexrelease}
76   \latexrelease\EndIncludeInRelease
77   \latexrelease\IncludeInRelease{0000/00/00}%
78   \latexrelease{}{\nocite}{Allow nocite in preamble}%
79   \latexrelease
80   \latexrelease\def\nocite#1{\@bsphack
81   \latexrelease\ifx\onlypreamble\document
82   \latexrelease\@for\@citeb:=#1\do{%
83   \latexrelease\edef\@citeb{\expandafter\firstofone\@citeb}%
84   \latexrelease\if@filesw\immediate\write\auxout{\string\citation{\@citeb}}\fi
85   \latexrelease\@ifundefined{b@\@citeb}{\G@refundefinedtrue
86   \latexrelease\@latex@warning{Citation ‘\@citeb’ undefined}}{}%
87   \latexrelease\else
88   \latexrelease\@latex@error{Cannot be used in preamble}\@eha
89   \latexrelease\fi
90   \latexrelease\@esphack}
91   \latexrelease
92   \latexrelease\EndIncludeInRelease
93   {*2ekernel}

```

Since `\nocite{*}` should not produce a warning about undefined citation keys (see PR 557), we need to set the control sequence ‘`\b@*`’ to something other than `\relax`. As a result `\cite{*}` will not warn either (but that never worked with BibTeX in the first place).

```
94 \expandafter\let\csname b@\endcsname\empty
```

(*End of definition for `\nocite`.*)

1.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

```
\@cite
95 \def\@cite#1#2{[#1\if@tempswa , #2\fi]}%
```

(*End of definition for `\@cite`.*)

`\@cite@ofmt` This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of `b@\@citeb`; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

```
96 \let\@cite@ofmt\hbox
```

(*End of definition for `\@cite@ofmt`.*)

```
\@biblabel
97 \def\@biblabel#1{[#1]}
98 {/2ekernel}
```

(*End of definition for `\@biblabel`.*)

File 48

lmarks.dtx

Abstract

Marks are used to communicate information about the content of a page to the output routine. For example, in order to construct running headers, the output routine needs information about which section names are present on a page, and this information is passed to it through the mark system. However, marks may also be used for other purposes. This module provides a generalized mechanism for marks of independent classes.

1 Introduction

The TEX engines offer a low-level mark mechanism to communicate information about the content of the current page to the asynchronous operating output routine. It works by placing `\mark` commands into the source document. When the material for the current page is assembled in box 255, TEX scans for such marks and sets the commands `\topmark`, `\firstmark` and `\botmark`. The `\firstmark` receives the content of the first `\mark` seen in box 255 and `\botmark` the content of the last mark seen. The `\topmark` holds the content of the last mark seen on the previous page or more exactly the value of `\botmark` from the previous page. If there are no marks on the current page then all three are made equal to the `\botmark` from the previous page.

This mechanism works well for simple formats (such as plain TEX) whose output routines are only called to generate pages. It fails, however, in LATEX (and other more complex formats), because here the output routine is sometimes called without producing a page, e.g., when encountering a float and placing it into one of the float regions. In that case the output routine is called, determines where to place the float, alters the goal for assembling text material (if the float was added to the top or bottom region) and then it resumes collecting textual material.

As a result the `\botmark` gets updated and so `\topmark` no longer reflects the situation at the top of the next page when that page is finally boxed.

Another problem for LATEX was that it wanted to use several “independent” marks and in the early implementations of TEX there was only a single `\mark` command available. For that reason LATEX implemented its own mark mechanism where the marks always contained two parts with their own interfaces: `\markboth` and `\markright` to set marks and `\leftmark` and `\rightmark` to retrieve them.

However, this extended mechanism (while supporting scenarios such as chapter/section marks) was far from general. The mark situation at the top of a page (i.e., `\topmark`) remained unusable and the two marks offered were not really independent of each other because `\markboth` (as the name indicates) was always setting both.

The new mechanism overcomes both issues:

- It provides arbitrarily many, fully independent named marks, that can be allocated and, from that point onwards, used.
- It offers access for each such marks to retrieve its top, first, and bottom values separately.
- Furthermore, the mechanism is augmented to give access to marks in different “regions” which may not be just full pages.

2 Design-level and code-level interfaces

The interfaces are mainly meant for package developers, but they are usable (with appropriate care) also in the document preamble, for example, when setting up special running headers with `fancyhdr`, etc. They are therefore available both as CamelCase commands as well as commands for use in the L3 programming layer. Both are described together below.

```
\NewMarkClass \NewMarkClass {<class>}
\mark_new_class:n \mark_new_class:n {<class>}
```

Declares a new `<class>` of marks to be tracked by L^AT_EX. Each `<class>` must be declared before it is used.

Mark classes can only be declared before `\begin{document}`.

```
\InsertMark \InsertMark {<class>} {<text>}
\mark_insert:nn \mark_insert:nn {<class>} {<text>}
```

Adds a mark to the current galley for the `<class>`, containing the `<text>`.

It has no effect in places in which you can't place floats, e.g., a mark inside a box or inside a footnote never shows up anywhere.

If used in vertical mode it obeys L^AT_EX's internal `\nobreak` switch, i.e., it does not introduce a breakpoint if used after a heading. If used in horizontal mode it doesn't handle spacing (like, for example, `\index` or `\label` does, so it should be attached to material that is typeset).

```
insertmark \AddToHook {insertmark} {<code>}
```

When marks are inserted, the mark content may need some special treatment, e.g., by default `\label`, `\index`, and `\glossary` do not expand at this time (but only later if and when the mark content is actually used). In order to allow packages to augment or alter this setup there is a public hook `insertmark` that is executed at this point. It runs in a group so local modification to commands are only applied to the `<text>` argument of `\InsertMark` or `\mark_insert:nn`.

```
\TopMark      * \TopMark  [⟨region⟩] {⟨class⟩}
\FirstMark    * \FirstMark [⟨region⟩] {⟨class⟩}
\LastMark     * \LastMark [⟨region⟩] {⟨class⟩}
\mark_use_top:nn * \mark_use_top:nn {⟨region⟩} {⟨class⟩}
\mark_use_first:nn * \mark_use_first:nn {⟨region⟩} {⟨class⟩}
\mark_use_last:nn * \mark_use_last:nn {⟨region⟩} {⟨class⟩}
```

These functions expand to the appropriate mark ⟨text⟩ for the given ⟨class⟩ in the specified ⟨region⟩. The default ⟨region⟩ in the design-level commands is page. Note that with the L3 layer commands there are no optional arguments, i.e., both arguments have to be provided.

TEXhackers note: The result is returned within the \unexpanded primitive (\exp_not:n), which means that the ⟨text⟩ does not expand further when appearing in an x-type or e-type argument expansion.

The “first” and “last” marks are those seen first and last in the current region/page, respectively. The “top” mark is the last mark of the ⟨class⟩ seen in an earlier region, i.e., the ⟨text⟩ what would be “current” at the very top of the region.

Important!

The commands are only meaningful inside the output routine, in other places their result is (while not random) unpredictable due to the way L^AT_EX cuts text material into pages. There is, however, one exception: if you produce multiple columns using the multicol package, it is possible to retrieve mark values from the regions `first-column`, `last-column`, `mcol-1`, `mcol-2`,... directly after the environment has ended. This can, for example, be useful if a `multicols` has been used inside a box.

Currently, ⟨region⟩ is one of `page`, `previous-page`, `column`, `previous-column`, `first-column`, `last-column`, and `mcol-1` (first column in a `multicols`), `mcol-2` (second column in a `multicols`), up to `mcol-20` (twentieth column in a `multicols`). See section ?? for discussion of how these regions behave and how one can make use of them.

```
\IfMarksEqualTF   * \IfMarksEqualTF  [⟨region⟩] {⟨class⟩} {⟨pos1⟩} {⟨pos2⟩} {⟨true⟩} {⟨false⟩}
\IfMarksEqualT   * \mark_if_eq:nnnTF {⟨region⟩} {⟨class⟩} {⟨pos1⟩} {⟨pos2⟩} {⟨true⟩} {⟨false⟩}
\IfMarksEqualF   * \mark_if_eq:nnnnTF {⟨region1⟩} {⟨class1⟩} {⟨pos1⟩}
                  {⟨region2⟩} {⟨class2⟩} {⟨pos2⟩} {⟨true⟩} {⟨false⟩}
\mark_if_eq:nnnnTF *
\mark_if_eq:nnnnnnTF *
```

* These conditionals allow you to compare the content of two marks and act based on the result. The commands work in an expansion context, if necessary.

It is quite common when programming with marks to need to interrogate conditions such as whether marks have appeared on a previous page, or if there are multiple marks present on the current page, and so on. The tests above allow for the construction of a variety of typical test scenarios, with three examples presented below.

The first two conditionals cover only the common scenarios. Both marks are picked up from the same ⟨region⟩ (by default `page`) and they have to be of the same ⟨class⟩.⁴¹ The ⟨pos_i⟩ argument can be either `top`, `first`, or `last`.

Important to note is that the comparison is not with respect to the textual content of the marks but whether or not they originated from the same \InsertMark command (or the L3 layer version \mark_insert:nn).

If you wish to compare marks across different regions or across different classes, you have to do it using the generic test only available in the L3 programming layer or do it manually, i.e., get the marks and then compare the values yourself.⁴²

⁴¹If an undeclared mark class is used the tests return *true* (not an error).

⁴²If two undeclared mark classes are compared the result is always *true*; if a declared and an undeclared

2.1 Use cases for conditionals

However, the basic version is enough for the following typical use cases:

Test for at most one mark of class `myclass` on current page: If the first and last mark in a region are the same then either there was no mark at all, or there was at most one. To test this on the current page:

```
\NewMarkClass{myclass}
\IfMarksEqualTF{myclass}{first}{last}
  { <zero or one mark> }{ <two or more marks> }
```

Test for no mark of class `myclass` in the previous page: If the top mark is the same as the first mark, there is no mark in the region at all. If we wanted to do this test for the previous page:

```
\IfMarksEqualTF[previous-page]{myclass}{top}{first}
  { <no marks> }{ <at least one mark> }
```

Comparing `top` and `last` would give you the same result.

Test for zero, one, or more than one: Combining the two tests from above you can test for zero, one or more than one mark.

```
\IfMarksEqualTF{myclass}{top}{first}
  { <no marks> }
  {\IfMarksEqualTF{myclass}{first}{last}
    { <exactly one mark> }{ <more than one mark> }}
```

If you need one of such tests more often (or if you want a separate command for it for readability), then consider defining:

```
\providetcommand\IfNoMarkTF[2][page]{\IfMarksEqualTF[#1]{#2}{first}{last}}
```

2.2 Understanding regions

If a page has just been finished then the region `page` refers to the current page and `previous-page`, as the name indicates, refers to the page before the current page. This means you are able to access mark information for the current page as well as for the page before (as long as you are inside the output routine) without the need to explicitly save that information beforehand. The `page` region is the region that is most often queried, which is why commands like `\FirstMark` use that region by default.

In single column documents the `column` is the same as the `page` region, but in two-column documents (if not produced by `multicols`), `column` refers to the current column that just got finished and `previous-column` to the one previously finished. Code for running headers is (in standard L^AT_EX) evaluated only after both columns have been assembled, which is another way of saying that in that case `previous-column` refers to the left column and `column` to the right column. However, to make these somewhat easier to use, there are also aliased names for these two regions: `first-column` and `last-column`.⁴³

mark class is used it is always *false*.

⁴³The region is called “last-column” not “second-column” in anticipation of extending the mechanism to multiple columns, where first and last would still make sense. There aren’t any `previous-first-column` and `previous-last-column` regions to access the corresponding columns from the previous page.

Note that you can only look backwards at already processed regions, e.g., in a `twoside` document finishing a recto (odd, right-hand) page you can access the data from the facing verso (left-hand) page, but if you are finishing a left-hand page you can't integrate data from the upcoming right-hand page. If such a scenario needs to be realized then it is necessary to save the left-hand page temporarily instead of finalizing it, process material for the right-hand page and once both are ready, attach running headers and footers and shipout both in one go.⁴⁴

The situation starts getting rather complex if you allow for multiple columns in the way they are supported by the `multicol` package. In this case you might have a variable number of “columns” on a single page to be shipped out. And even if not, then a `multicols` might start or end in the middle of the page; in either case, the regions `column` and `previous-column` become rather meaningless and you should therefore not use them.⁴⁵ Instead, the algorithm offers `mcol-1`, `mcol-2`, `mcol-3`, etc., to represent the columns in the `multicols` on the current page to be shipped out. If there is more than one `multicols` on the current page then in the output routine only the columns of the last one will be accessible.

These provisions cover, out of the box, a number of layouts and use cases, but obviously not all. However, more cases can be supported by storing away mark information during the processing. Here is the full algorithm:

- The `column` region is used by the “current column” that is being built (moving through all columns with `previous-column` trailing behind (to handle top marks properly).
- When the `multicols` starts, the `column` region is cleared, i.e., from that point on it looks as if there have not been any marks so far. This will make sure that the top mark in the first column is always empty.
- If the `multicols` extends beyond the current page, then the material designated for the current page is split into columns. The `column` region is used to represent each column in turn.
 - First we copy the current data from `column` to `previous-column`. Then the mark data from the current column is placed into the `column` region. Then we alias `column` to `mcol-1`.
 - These steps are repeated for all columns of the `multicols` environment.
 - Finally, the first and the last column of that page is also made available as `first-column` and `last-column`, respectively.
- All those marks inside any of the columns are also available in the `page` region. Thus, if you are interested in the top, first, or last mark of a specific class on the whole page you simply need to query for it in the `page` region.
- If the `multicols` continues across several pages then this algorithm above is repeated for each page, except that the `column` region is not cleared again. This means that the top mark of the first column of the next page will be the last mark of the last column from the previous page.

⁴⁴As of now that scenario is not (yet) officially supported but it would be possible to achieve this using the shipout hooks to store the verso page and then on the next shipout use the hook to shipout both with running headers and footers attached.

⁴⁵They return something, because they represent the last two columns of the `multicols` when you are inside the output routine, but that is obviously of little use.

- When the `multicols` finishes the remaining material for the current page is balanced to produce columns of roughly equal height.
- Again `column` and `previous-column` are used while this balancing happens and `mcol-1`, `mcol-2`, etc., are used to represent the column regions and `first-column` and `last-column` are set appropriately.
- Then the balanced set of columns is returned back to the page (since there may be space for further material). In addition, all marks inside that material are reinserted so that they become available in the `page` region.
- As a side effect, it is possible (and useful in certain circumstances) to query for mark classes directly after the `multicols` has ended without the need to be inside the output routine. The regions that can be queried this way are `mcol-1`, `mcol-2`, etc. (up to the number of columns the multicol had) and `first-column` and `last-column`.

2.3 Debugging mark code

```
\DebugMarksOn    \DebugMarksOn ... \DebugMarksOff
\DebugMarksOff
\mark_debug_on:
\mark_debug_off:
```

Commands to turn the debugging of mark code on or off. The debugging output is rather coarse and not really intended for normal use at this point in time.

3 Application examples

If you want to figure out if a break was taken at a specific point, e.g., whether a heading appears at the top of the page, you can do something like this:

```
\newcounter{breakcounter}
\NewMarkClass{break}
\newcommand\markedbreak[1]{\stepcounter{breakcounter}%
                           \InsertMark{break}{\arabic{breakcounter}}%
                           \penalty #1\relax
                           \InsertMark{break}{-\arabic{breakcounter}}}
```

To test if the break was taken you can test if `\TopMark{break}` is positive (taken) or negative (not taken) or zero (there was never any marked break so far). The absolute value can be used to keep track of which break it was (with some further coding).

to be extended with additional application examples

4 Legacy L^AT_EX 2 _{ε} interface

Here we describe the interfaces that L^AT_EX 2 _{ε} offered since the early nineties and some minor extensions.

4.1 Legacy design-level and document-level interfaces

```
\markboth \markboth {\left} {\right}
\markright \markright {\right}
```

LATEX 2_E uses two marks which aren't fully independent. A "left" mark generated by the first argument of `\markboth` and a "right" mark generated by the second argument of `\markboth` or by the only argument of `\markright`. The command `\markboth` and `\markright` are in turn called from heading commands such as `\chaptermark` or `\sectionmark` and their behavior is controlled by the document class.

For example, in the `article` class with `twoside` in force the `\sectionmark` will issue `\markboth` with an empty second argument and `\subsectionmark` will issue `\markright`. As a result the left mark will contain chapter titles and the right mark subsection titles.

Note, however, that in one-sided documents the standard behavior is that only `\markright` is used, i.e., there will only be right-marks but no left marks!

```
\leftmark * \leftmark
\rightmark * \rightmark
```

These functions return the appropriate mark value from the current page and work as before, that is `\leftmark` will get the last (!) left mark from the page and `\rightmark` the first (!) right mark.

In other words they work reasonably well if you want to show the section title that is current when you are about to turn the page and also show the first subsection title on the current page (or the last from the previous page if there wasn't one). Other combinations can't be shown using this interface.

The commands are fully expandable, because this is how they have been always defined in LATEX. However, this is of course only true if the content of the mark they return is itself expandable and does not contain any fragile material. Given that this can't be guaranteed for arbitrary content, a programmer using them in this way should use `\protected@edef` and *not* `\edef` to avoid bad surprises as far as this is possible, or use the new interfaces (`\TopMark`, `\FirstMark`, and `\LastMark`) which return the `\text` in `\exp_not:n` to prevent uncontrolled expansion.

4.2 Legacy interface extensions

The new implementation adds three mark classes: `2e-left`, `2e-right` and `2e-right-nonempty` and patches `\markboth` and `\markright` slightly so that they also update these new mark classes, so that the new classes work with existing document classes.

As a result you can use `\LastMark{2e-left}` and `\FirstMark{2e-right}` instead of `\leftmark` and `\rightmark`. But more importantly, you can use any of the other retrieval commands to get a different status value from those marks, e.g., `\LastMark{2e-right}` would return the last subsection on the page (instead of the first as returned by `\rightmark`).

The difference between `2e-right` and `2e-right-nonempty` is that the latter will only be updated if the material for the mark is not empty. Thus `\markboth{title}{}` as issued by, say, `\sectionmark`, sets a `2e-left` mark with `title` and a `2e-right` mark with the empty string but does not add a `2e-right-nonempty` mark.

Thus, if you have a section at the start of a page and you would ask for `\FirstMark{2e-right}` you would get an empty string even if there are subsections on that page. But `2e-right-nonempty` would then give you the first or last subsection

on that page. Of course, nothing is simple. If there are no subsections it would tell you the last subsection from an earlier page. We therefore need comparison tools, e.g., if top and first are identical you know that the value is bogus, i.e., a suitable implementation would be

```
\IfMarksEqualTF{2e-right-nonempty}{top}{first}
  { <appropriate action if there was no real mark> }
  {\FirstMark{2e-right-nonempty}}
```

5 Notes on the mechanism

In contrast to vanilla \TeX , $\varepsilon\text{-}\text{\TeX}$ extends the mark system to allow multiple independent marks. However, it does not solve the \topmark problem which means that \LaTeX still needs to manage marks almost independently of \TeX . The reason for this is that the more complex output routine used by \LaTeX to handle floats (and related structures) means that \topmark(s) remain unreliable. Each time the output routine is fired up, \TeX moves \botmark to \topmark , and while $\varepsilon\text{-}\text{\TeX}$ extends this to multiple registers the fundamental concept remains the same. That means that the state of marks needs to be tracked by \LaTeX itself. An early implementation of this package used \TeX 's \botmark only to ensure the correct interaction with the output routine (this was before the $\varepsilon\text{-}\text{\TeX}$ mechanism was even available). However, other than in a prototype implementation for $\text{\LaTeX}3$, this package was never made public.

The new implementation now uses $\varepsilon\text{-}\text{\TeX}$'s marks as they have some advantages, because with them we can leave the mark text within the galley and only extract the marks during the output routine when we are finally shipping out a page or storing away a column for use in the next page. That means we do not have to maintain a global data structure that we have to keep in sync with informational marks in the galley but can rely on everything being in one place and thus manipulations (e.g. reordering of material) will take the marks with them without a need for updating a fragile linkage.

To allow for completely independent marks we use the following procedure:

- For every type of marks we allocate a mark class so that in the output routine \TeX can calculate for each class the current top, first, and bottom mark independently. For this we use \newmarks , i.e., one marks register per class.
- As already mentioned firing up an output routine without shipping out a page means that \TeX 's top marks get wrong so it is impossible to rely on \TeX 's approach directly. What we do instead is to keep track of the real marks (for the last page or more generally last region) in some global variables.
- These variables are updated in the output routine at defined places, i.e., when we do real output processing but not if we use special output routines to do internal housekeeping.
- The trick we use to get correctly updated variables is the following: the material that contains new marks (for example the page to be shipped out) is stored in a box. We then use \TeX primitive box splitting functions by splitting off the largest amount possible (which should be the whole box if nothing goes really wrong). While that seems a rather pointless thing to do, it has one important side effect: \TeX sets up first and bottom marks for each mark class from the material it has split off. This way we get the first and last marks (if there have been any) from the material in the box.

- The top marks are simply the last marks from the previous page or region. And if there hasn't been a first or bottom mark in the box then the new top mark also becomes new first and last mark for that class.
- That mark data is then stored in global token lists for use during the output routine and legacy commands such as `\leftmark` or new commands such as `\TopMark` simply access the data stored in these token lists.

That's about it in a nutshell. Of course, there are some details to be taken care of—those are discussed in the implementation sections.

6 Public interfaces for packages such as `multicol`

The functions in this section are public so that packages can make use of them. However, this must be done with great care, e.g., `\mark_update_structure_from_material:nn` updates the global mark structure and can therefore be used only in places where such an update is meaningful, e.g., in special output routines. Elsewhere, a change to the mark structure would break the whole mechanism and querying the marks would return incorrect data.

`\mark_update_structure_from_material:nn \mark_update_structure_from_material:nn {<region>} {<material with marks>}`

Helper function that inspects the marks inside the second argument and assigns new mark values based on that to the `<region>` given in the first argument. For this it first copies the mark structure from `<region>` to `previous-<region>` and then takes all last mark values currently in the region and makes them the new top mark values. Finally it assigns new first and last values for all mark classes based on what was found in the second argument.

As a consequence, the allowed values for `<region>` are `page` and `column` because only they have `previous-...` counterparts.

Another important aspect to keep in mind is that marks are recognized only if they appear on the top level, e.g., if we want to process material stored in boxes we need to put it unboxed (using `\unvcopy` etc.) into the second argument.

`\mark_copy_structure:nn \mark_copy_structure:nn {<alias>} {<source>}`

Helper function that copies all mark values in the `<source>` region to `<alias>`, i.e., make the structures identical. Used to update the `previous-...` structures inside `\mark_update_structure_from_material:nn` and `first-column` and `last-column` structures inside the internal commands `_mark_update_singlecol_structures:` or `_mark_update_dblcol_structures:`.

`\mark_set_structure_to_err:n \mark_set_structure_to_err:n {<region>}`

Helper function that sets all mark values in the `<region>` to an error message. This is currently used for `last-column` at times where using marks from it would be questionable/wrong, i.e., when we have just processed the first column in a two-column document.

```
\mark_clear_structure:n \mark_clear_structure:n {\<region>}
```

Helper function that sets all mark values in the `<region>` to empty. This is currently used for `column` when a `multicol` environment starts; this is because it wouldn't make sense if the top mark in the first column returned the last mark from a previous `multicol` (which may have been much earlier, with intermediate material).

```
\mark_get_marks_for_reinsertion:nNN \mark_get_marks_for_reinsertion:nNN {\<source>}
  (token-list-var for collecting first marks)
  (token-list-var for collecting last marks)
```

Helper function for extracting marks that would otherwise get lost, for example when they are hidden inside a box. This helper does not update mark structures and can therefore be used outside the output routine as well.

It collects all the top-level marks from inside the `<source>` and then adds suitable `\mark_insert:nn` commands to each of the two token lists. These token lists can then be executed at the right place to reinsert the marks, e.g., directly after the box. This is, for example, going to be used⁴⁶ by `multicol` when a short balanced `multicols` is returned to the galley for typesetting.

If the `<source>` consists of a single vertical box (plus possibly followed by some glue but nothing else) then the box is unpacked and the top-level marks are collected from its content. However, if it is not a vertical box or there are other data then nothing is unpacked and you have to do the unpacking yourself to get at the marks inside.

It is quite likely that one only needs a single token list for returning the `\mark_insert:nn` statements. If that is the case this command may change to take only two arguments.

7 Internal functions for the standard output routine of L^AT_EX

The functions in this section are tied to the output routine and used in the interface to L^AT_EX 2_ε and perhaps at some later time within a new output routine for L^AT_EX. They are not (yet) meant for general use and are therefore made internal, even though we already use them in `multicol`. Internal means that `@@` automatically gets replaced in the code (and in the documentation) so we have to give it a suitable value.

1 `(@@=mark)`

```
\__mark_update_singlecol_structures: \__mark_update_singlecol_structures:
```

L^AT_EX 2_ε integration function in case we are doing single column layouts. It assumes that the page content is already stored in `\@outputbox` and processes the marks inside that box. It is called as part of `\@opcol`.

```
\__mark_update dblcol_structures: \__mark_update_singlecol_structures:
```

L^AT_EX 2_ε integration function mark used when we are doing double column documents. It assumes that the page content is already stored in `\@outputbox` and processes the marks inside that box. It then does different post-processing depending on the start of the switch `\if@firstcolumn`. If we are in the second column it also has to update page marks, otherwise it only updates column marks. It too is called as part of `\@opcol`.

⁴⁶Probably not before 2025, though.

8 The Implementation

```
2  {*2ekernel | latexrelease}
3  \ExplSyntaxOn
4  ⟨latexrelease⟩\NewModuleRelease{2022/06/01}{ltmarks}
5  ⟨latexrelease⟩                                {Marks~handling}
```

8.1 Allocating new mark classes

`\g_mark_classes_seq` A list holding all the mark classes that have been declared.

```
6  \seq_new:N \g_mark_classes_seq
```

`\mark_new_class:n` A mark class is created by initializing a number of data structures. First, we get a register number to refer to the mark class. The new mark class is then added to the `\g_mark_classes_seq` sequence to be able to easily loop over all classes. Finally a number of top-level global token lists are declared that hold various versions of the mark for access.

```
7  \cs_new_protected:Npn \mark_new_class:n #1
8  {
9    \seq_if_in:NnTF \g_mark_classes_seq {#1}
10   {
11     \msg_error:nnn { mark } { class-already-defined }
12     {#1}
13   }
14   { \__mark_new_class:nn {#1} }
15 }
```

This is only available in the preamble.

```
16 \onlypreamble \mark_new_class:n
```

The internal command carries out the necessary allocations.

```
17 \cs_new_protected:Npn \__mark_new_class:nn #1
18 {
19  (*trace)
20  \__mark_debug:n { \iow_term:x { Marks:-new-mark:-#1-\msg_line_context: } }
21 (/trace)}
```

Use the L^AT_EX 2 _{ε} interface for now as the L3 programming layer doesn't have one for marks yet.

```
22 \exp_args:Nc \newmarks {c_mark_class_ #1 _mark}
```

Remember the new class in the sequence.

```
23 \seq_gput_right:Nn \g_mark_classes_seq {#1}
24 \__mark_init_region:nn {page}{#1}
```

For the page region we also keep track of the previous-page.

```
25 \__mark_init_region:nn {previous-page}{#1}
```

Same game for column and previous-column

```
26 \__mark_init_region:nn {column}{#1}
27 \__mark_init_region:nn {previous-column}{#1}
```

But for columns we also allocate token lists for the alias regions `first-column` and `last-column`.

```
28  \__mark_init_region:nn {first-column}{#1}
29  \__mark_init_region:nn {last-column}{#1}
```

To support multiple columns produced by the `multicol` package, we preallocate twenty alias regions (since this is the number of columns that `multicol` supports as a maximum). They are filled by copying the current `column` into the appropriate `mcol-....`

```
30 %fmi \__mark_init_region:nn {mcol}{#1}
31 %fmi \__mark_init_region:nn {previous-mcol}{#1}
32 \__mark_init_region:nn {mcol-1}{#1}
33 \__mark_init_region:nn {mcol-2}{#1}
34 \__mark_init_region:nn {mcol-3}{#1}
35 \__mark_init_region:nn {mcol-4}{#1}
36 \__mark_init_region:nn {mcol-5}{#1}
37 \__mark_init_region:nn {mcol-6}{#1}
38 \__mark_init_region:nn {mcol-7}{#1}
39 \__mark_init_region:nn {mcol-8}{#1}
40 \__mark_init_region:nn {mcol-9}{#1}
41 \__mark_init_region:nn {mcol-10}{#1}
42 \__mark_init_region:nn {mcol-11}{#1}
43 \__mark_init_region:nn {mcol-12}{#1}
44 \__mark_init_region:nn {mcol-13}{#1}
45 \__mark_init_region:nn {mcol-14}{#1}
46 \__mark_init_region:nn {mcol-15}{#1}
47 \__mark_init_region:nn {mcol-16}{#1}
48 \__mark_init_region:nn {mcol-17}{#1}
49 \__mark_init_region:nn {mcol-18}{#1}
50 \__mark_init_region:nn {mcol-19}{#1}
51 \__mark_init_region:nn {mcol-20}{#1}
52 }
```

(End of definition for `\mark_new_class:n` and `__mark_new_class:nn`. This function is documented on page 1004.)

`__mark_init_region:nn`
`\c__mark_empty_tl` For each class (#2) and region (#1), we need three token lists: one for top, first, and last. The default value to be returned is “empty”.

```
53 \cs_new_protected:Npn \__mark_init_region:nn #1 #2 {
54   \tl_new:c { g__mark_#1_top_ #2 _tl }
55   \tl_new:c { g__mark_#1_first_ #2 _tl }
56   \tl_new:c { g__mark_#1_last_ #2 _tl }
57   \tl_gset_eq:cN { g__mark_#1_top_ #2 _tl } \c__mark_empty_tl
58   \tl_gset_eq:cN { g__mark_#1_first_ #2 _tl } \c__mark_empty_tl
59   \tl_gset_eq:cN { g__mark_#1_last_ #2 _tl } \c__mark_empty_tl
60 }
```

All marks will have an identification in the form of a number⁴⁷ that is incremented each time a mark insertion happens; therefore the initial empty values should also have such a number, so that data extraction will be uniform.

```
61 \tl_const:Nn \c__mark_empty_tl { \__mark_value:nn{0}{} }
```

(End of definition for `__mark_init_region:nn` and `\c__mark_empty_tl`.)

⁴⁷There are a few cases where special identification strings are used, e.g., 2.09-compat.

8.2 Updating mark structures

For some operations we need two temporary private boxes and two private global token lists.

```

\l__mark_box
\l__mark_ii_box
\g__mark_tmp_tl
\g__mark_new_top_tl
 62 \box_new:N \l__mark_box
 63 \box_new:N \l__mark_ii_box
 64 \tl_new:N \g__mark_tmp_tl
 65 \tl_new:N \g__mark_new_top_tl

```

(End of definition for `\l__mark_box` and others.)

`_mark_extract_and_handle_marks:nn`

This is the main macro to extract and handle marks inside some vertical material. It is used by `\mark_update_structure_from_material:nn` (for updating the mark structure for a region based on the marks found) and by `\mark_get_marks_for_reinsertion:nNN` (for extracting marks from some material and prepare for reinserting them later (e.g., out of a box that is placed as a box into the main galley)).

```

 66 \cs_new_protected:Npn \_mark_extract_and_handle_marks:nn #1#2 {

```

This macro expects code to handle extracted marks in its first argument and vertical material (not boxed or just consisting of a single vertical box) as its second. It extracts top-level mark information from #2, stores them as split marks and then calls #1 to make use of this information.

If it finds a forced break in the material it removes it and then restarts the attempt without it.

We start with a group to keep most changes local.

```

 67 \group_begin:

```

Getting the first and last marks out of the material in #2 is done by putting the material in a box and then doing a split operation to the maximum size possible (which hopefully gets us all of the content).⁴⁸ Because this action is used only to get the mark values, we don't want any underfull box warnings so we (locally) turn those off.

```

 68 \dim_set_eq:NN \tex_splitmaxdepth:D \c_max_dim
 69 \int_set_eq:NN \tex_vbadness:D \c_max_int
 70 \dim_set_eq:NN \tex_vfuzz:D \c_max_dim

```

There is a further complication: if the material contains infinite shrinking glue then a `\vsplit` operation will balk with a low-level error. Now pages or columns, which are our main concern here, can't have such infinite shrinkage if they are cut straight from the galley, however the use of `\enlargethispage` actually does add some at the very bottom (and also wraps the whole page into a box by itself, so if we leave it this way then a) we get this error and b) we don't see any marks because they are hidden one level down).

Another possible issue are packages or user code that place stray `\vboxes` directly into the main galley (an example is `marginnote` that attaches its marginals in this way). If such boxes end up as the last item on the page we should not unpack them.

All these issues need to be handled, which is done in `_mark_prepare_and_extract:nn`.

```

 71 \_mark_prepare_and_extract:nn {#1} {#2}

```

⁴⁸With normal column material cut from the main galley we should always get all material in one go, but in certain situations, for example, in a `multicols` environment that contains some `\columnbreaks` a single split operation will not be enough. Thus, this is something we need to handle.

Once all mark classes have been processed, the data structures are updated and we can close the group, which undoes our local changes and retains only the global ones.

```

72     \group_end:
73 }
```

(End of definition for __mark_extract_and_handle_marks:nn.)

__mark_prepare_and_extract:nn

This macro does the dirty work. It is not directly integrated in __mark_extract_and_handle_marks:nn because we may have to call it recursively if we find forced breaks.

```
74 \cs_new_protected:Npn \__mark_prepare_and_extract:nn #1#2 {
```

To handle the \enlargethispage case we do an \unskip to get rid of any glue that is present at the very end of the material and also check if we have then a \vbox as the last item and if so unpack that too, but only under certain conditions, see below. All this is temporary done in a group, just for getting the marks out, so it doesn't affect the final page production.

```

75 \vbox_set:Nn \l__mark_box
76 {
77 #2
78 \tex_unskip:D
79 \box_set_to_last:N \l__mark_box
```

After having removed the last box from the current list (if there was one) we check whether the vertical list is now empty. If not, then the last box is definitely not the one from \enlargethispage and so we can, and should, leave it alone. Otherwise we check if this last box is a \vbox.

```

80 \int_compare:nNnT \tex_lastnodetype:D < 0
81 {
82 \box_if_vertical:NT \l__mark_box
```

If it is, we unpack the box.

```
83 { \vbox_unpack:N \l__mark_box }
84 }
```

If it wasn't a vbox, it was either an hbox or there was no box. Given that we are only interested in the marks we don't need put it back in that case.

```
85 }
```

We are now ready to \vsplit the box to get at the marks. If the box contains some infinite negative glue the TeX will produce an error complaining about it but it will correctly find the split marks. Given that we can't prevent that error, we hide it from the user and ensure that TeX doesn't stop. The error message still shows in the log, but even that is mitigated as best as possible—see the definition of __mark_vbox_set_split_to_maxdimen:NN for the tricks employed.

```
86 \__mark_vbox_set_split_to_maxdimen:NN \l__mark_i_box \l__mark_box
```

After splitting we check if there is anything left in \l__mark_box. If not then the above split has set some split marks that we can then use to finish the extraction:

```

87 \box_if_empty:NTF \l__mark_box
88 { #1 }
```

If we have a remainder after the split then this means that there was some forced break in the material. We get rid of that by combining the content of the two boxes and restart.

```

89      {
90  <*trace>
91      \__mark_debug:n { \iow_term:x
92          { Marks:~ mark~ extraction-needs~ recursion~
93              \msg_line_context: } }
94 </trace>
95      \__mark_prepare_and_extract:mn {#1}
96          { \vbox_unpack:N \l__mark_ii_box
97              \vbox_unpack:N \l__mark_box     }
98      }
99 }
```

(End of definition for __mark_prepare_and_extract:nn.)

__mark_vbox_set_split_to_maxdimen:NN Split a box to get at its marks without pausing even if T_EX is producing an error message because of infinite negative glue in the box. If there is such an error we ensure that it only shows up in the log but not on the terminal.

The nice low-level hack by DPC records in the .log that a glue shrinkage error is harmless.

We disguise \c_max_dim in an odd looking csname, which then shows up as part of the display of an error message if that error happens. This csname forms part of the error display so what you get is something like

```

! Infinite glue shrinkage found in box being split.
<argument> Infinite shrink error above ignored !
1. ... }
```

which hopefully makes it clear that the error is harmless and and should be ignored by the reader of the .log.

100 \cs_set_eq:cN {Infinite~shrink~error~above~ignored~!}\c_max_dim

The whole definition of __mark_vbox_set_split_to_maxdimen:NN below is fully expanded, so we have to use a lot of \exp_not:N commands to prevent expansion where necessary.

101 \cs_new_protected:Npx __mark_vbox_set_split_to_maxdimen:NN #1#2 {

We start by saving the current interaction and escape char settings.

```

102   \tl_set:Nn \exp_not:N \l__mark_saved_parameters_tl
103   {
104     \tex_interactionmode:D
105     \exp_not:N \int_use:N \tex_interactionmode:D \scan_stop:
106     \tex_escapechar:D
107     \exp_not:N \int_use:N \tex_escapechar:D \scan_stop:
108 }
```

Then we change them so that no escape char is printed in the error message (accounts for the missing backslash in front of `Infinite shrink ...`) and we set the interaction to \nonstopmode so that the error (if any) just goes into the .log file and T_EX doesn't stop at that point.

```

109   \tex_escapechar:D -1 \scan_stop:
110   \tex_interactionmode:D 0 \scan_stop:
```

Then we do the splitting of the box to `\c_max_dim` to get at the marks. This may generate the error we are worried about, i.e., if the box contains infinite negative glue. However, TeX makes this glue finite and continues, which means we get our split marks which is really all we care about.

```
111 \tex_setbox:D #1 \tex_vsplit:D #2 to
```

The `\use:n` may seem pointless, and it is to some extent, but we need it to get our disguised `\c_max_dim` displayed properly as part of the error message if there is one. Without it, the display would show only part of what we want it to show (try it).

```
112 \exp_not:N \use:n {
113   \use:c{Infinite~shrink~error~above~ignored-!}
114 }
```

Finally, we change the escape char and the interaction mode back to what it was before:

```
115 \exp_not:N \l_mark_saved_parameters_tl
116 }
```

(End of definition for `_mark_vbox_set_split_to_maxdimen:NN`.)

`\l_mark_saved_parameters_tl` The temporary variable used for resetting escape char and interaction mode.

```
117 \tl_new:N \l_mark_saved_parameters_tl
```

(End of definition for `\l_mark_saved_parameters_tl`.)

`\mark_update_structure_from_material:nn` This function updates the mark structures of a region. The first argument is the region to update and second argument receives the material that holds the marks. Out of this material we extract the first and last marks for all classes (if there are any) to do the assignments.

```
118 \cs_new_protected:Npn \mark_update_structure_from_material:nn #1#2 {
119   \_mark_extract_and_handle_marks:nn
```

Once the marks can be extracted we update the structure from the split marks (code in `_mark_update_structure_from_splitmarks:n`).

```
120   { \_mark_update_structure_from_splitmarks:n {#1} }
121   { #2 }
122 }
```

(End of definition for `\mark_update_structure_from_material:nn`. This function is documented on page 1011.)

`_mark_update_structure_from_splitmarks:n` This macro is called after we have done a `\tex_vsplit:D` operation and the mark data is in the split marks.

```
123 \cs_new_protected:Npn \_mark_update_structure_from_splitmarks:n #1 {
```

The first thing we do is to copy the current region structure to `previous-...`; this leaves the current structure untouched so we can update it class by class (as is necessary).

```
124   \mark_copy_structure:nn { previous-#1 } {#1}
```

After this action we can get first and last marks of the various classes through `\tex_splitfirstmarks:D` and `\tex_splitbotmarks:D`. So now we loop over all classes stored in `\g_mark_classes_seq`.

```
125   \seq_map_inline:Nn \g_mark_classes_seq
126     {
```

First action: get the last mark from the previous region, i.e., `previous-#1`. But because it is also still inside `#1`, at the moment we use that to construct the name because this is a tiny bit faster. Given that we need this value in various assignments we store it away which avoids unnecessary further csname generations.

```
127          \tl_gset_eq:Nc \g__mark_new_top_tl { g__mark_#1_last_##1_t1 }
```

This will first of all become the new top mark for the current class.

```
128          \tl_gset_eq:cN { g__mark_#1_top_##1_t1 } \g__mark_new_top_tl
```

Next action is to get ourselves the new last mark from the material supplied.

```
129          \tl_gset:No \g__mark_tmp_t1
130          { \tex_splitbotmarks:D \use:c { c__mark_class_##1_mark } }
```

If this mark doesn't exist then obviously neither does the first mark, so both become the last mark from the previous region. We have to be a little careful here: something like `\mark_insert:nn{foo}{}` adds an “empty” mark that should not be confused with no mark at all. But no mark in our material will result in `\g__mark_tmp_t1` being fully empty. This is why we have to make sure that “empty” from `\mark_insert:nn` only appears to be empty when typeset but fails the next test (see below how this is done).

```
131          \tl_if_empty:NTF \g__mark_tmp_t1
132          {
133              \tl_gset_eq:cN { g__mark_#1_last_ ##1_t1 }
134              \g__mark_new_top_tl
135              \tl_gset_eq:cN { g__mark_#1_first_##1_t1 }
136              \g__mark_new_top_tl
137          }
```

If it wasn't empty, i.e., if it had a real value then we use this value for our new last mark instead.

```
138          {
139              \tl_gset_eq:cN { g__mark_#1_last_##1_t1 } \g__mark_tmp_t1
```

Because we had a last mark we also have a first mark (which might be the same, but might be not), so we pick that up and assign it to the appropriate token list. This explains why we first checked for the last mark because that makes the processing faster in case there is none.

```
140          \tl_gset:co { g__mark_#1_first_##1_t1 }
141          {
142              \tex_splitfirstmarks:D
143              \use:c { c__mark_class_##1_mark }
144          }
145          }
146      }
147 }
```

(End of definition for `__mark_update_structure_from_splitmarks:n`.)

\mark_get_marks_for_reinsertion:nNN

This function extracts the marks from the material in the first argument but it does not update any the mark structures. Instead, it collects the marks in the token lists given as the second and third argument, in such a way that they can be reinserted by just executing the token lists.⁴⁹

```
148 \cs_new_protected:Npn \mark_get_marks_for_reinsertion:nNN #1#2#3 {
```

⁴⁹It is probably enough to collect everything in a single token list as long as we put the first marks first and the last marks last). But for extra flexibility, I currently use 2 token lists. This might change when it is really clear that this is never needed.

First we clear the temporary token lists as we haven't seen any marks yet.

```
149  \tl_gclear:N \g_mark_first_marks_tl  
150  \tl_gclear:N \g_mark_last_marks_tl
```

Then we extract all top-level marks, thereby filling the token lists with suitable `\mark_insert:nn` calls.

```
151  \__mark_extract_and_handle_marks:nn
```

The first argument holds the code used for filling the token lists and the second holds the material from which all marks should be extracted.

```
152  \__mark_get_from_splitmarks:  
153  { #1 }
```

Finally, we copy the updated (or not updated) temporary token lists to the two that have been supplied when the function was called. By convention "get" operations return their values in local variables and `__mark_extract_and_handle_marks:nn` runs in a group, which is why we have to use global temporary variables for collecting.

```
154  \tl_set_eq:NN #2 \g_mark_first_marks_tl  
155  \tl_set_eq:NN #3 \g_mark_last_marks_tl  
156 }
```

(End of definition for `\mark_get_marks_for_reinsertion:nNN`. This function is documented on page 1012.)

`__mark_get_from_splitmarks:` This function is called after we have done a `\vsplit` to update the split marks. It loops through all mark classes to find out if there are marks for this class and if so updates the global tls used for collecting.

```
157 \cs_new_protected:Npn \__mark_get_from_splitmarks: {  
158   \seq_map_inline:Nn \g_mark_classes_seq  
159   {
```

First we get the last mark for the current class from the material supplied.

```
160           \tl_gset:No \g_mark_tmp_tl  
161           { \tex_splitbotmarks:D \use:c { c_mark_class_##1_mark } }
```

If this mark doesn't exist then obviously first mark doesn't either, so we do nothing (other than issuing some debugging info).

We have to be a little careful here: something like `\mark_insert:nn{foo}{}{}` adds an "empty" mark that we should not confuse with the case where there is no mark at all.

When there is no mark at all we get a truly empty `\g_mark_tmp_tl` as a result. This is why we have to make sure that an "empty" mark generated with `\mark_insert:nn` only appears to be empty when it is typeset, but fails the next test (see below how this is done).

```
162           \tl_if_empty:NTF \g_mark_tmp_tl  
163           {  
164             (*trace)  
165               \__mark_debug:n { \iow_term:x { Marks:~no~ marks~  
166                 for~ class~ '#1'~\msg_line_context: } }  
167             (/trace)  
168           }
```

If it wasn't empty, i.e., if it had a real value then we use this value for our new last mark instead. This means we put an appropriate `\mark_insert:nn` statement into `\g__mark_last_marks_tl`.

```

169
170  {*trace}
171          \__mark_debug:n { \iow_term:x { Marks:~ extract~ last-

```

The mark content in `\g__mark_tmp_tl` may contain arbitrary code that may react badly if it is expanded in a write. So we better avoid that expansion, otherwise debugging might generate spurious errors when turned on.

```

172          mark~ for~ class~ '##1'~ =~ \exp_not:o \g__mark_tmp_tl } }
173  
```

`/trace}`

```

174          \tl_gput_right:N \g__mark_last_marks_tl
175          { \mark_insert:nn {##1} { \__mark_drop_id:o { \g__mark_tmp_tl } } }
```

Because we had a last mark we also have a first mark (which might be the same, but might not be), so we pick that up and add it to the `\g__mark_first_marks_tl` token list. This explains why we first checked for the last mark because that makes the processing faster in case there is none.

```

176  {*trace}
177          \__mark_debug:n { \iow_term:x {
178              Marks:~ extract~ first~ mark~ for~ class~ '##1'~ =~

```

Again no expansion for the mark content.

```

179          \exp_not:o {
180              \tex_splitfirstmarks:D
181              \use:c { c__mark_class_##1_mark }
182          }
183      }
184  
```

`/trace}`

```

185          \tl_gput_right:N \g__mark_first_marks_tl
186          { \mark_insert:nn {##1}
187          }
```

We better drop the id from the returned value otherwise they will accumulate in the marks when reinserted.

```

188          \__mark_drop_id:o {
189              \tex_splitfirstmarks:D
190              \use:c { c__mark_class_##1_mark }
191          }
192      }
193  }
194  }
195  }
196 }
```

(End of definition for `__mark_get_from_splitmarks::`)

`\g__mark_first_marks_tl` These are two global temporary variables used in the code above.

`\g__mark_last_marks_tl`

```

197 \tl_new:N \g__mark_first_marks_tl
198 \tl_new:N \g__mark_last_marks_tl
```

(End of definition for `\g__mark_first_marks_tl` and `\g__mark_last_marks_tl`.)

`\mark_copy_structure:nn` This function copies the structure for one region to another, e.g., from `page` to `previous-page` above, or later from `column` to `first-column`, etc.

```
219 \cs_new_protected:Npn \mark_copy_structure:nn #1#2 {
```

This requires a simple loop through all mark classes copying the token list from one name to the next.

```
200   \seq_map_inline:Nn \g__mark_classes_seq
201   {
202     \tl_gset_eq:cc { g__mark_ #1 _top_ ##1 _tl }
203     { g__mark_ #2 _top_ ##1 _tl }
204     \tl_gset_eq:cc { g__mark_ #1 _first_ ##1 _tl }
205     { g__mark_ #2 _first_ ##1 _tl }
206     \tl_gset_eq:cc { g__mark_ #1 _last_ ##1 _tl }
207     { g__mark_ #2 _last_ ##1 _tl }
208   }
209 }
```

(End of definition for `\mark_copy_structure:nn`. This function is documented on page 1011.)

`\mark_clear_structure:n` This function sets the structure of one region back to an initial state, so that all classes return an empty value if queried.

```
210 \cs_new_protected:Npn \mark_clear_structure:n #1 {
```

This requires a simple loop through all mark classes.

```
211   \seq_map_inline:Nn \g__mark_classes_seq
212   {
213     \tl_gset_eq:cN { g__mark_ #1 _top_ ##1 _tl }
214     \c__mark_empty_tl
215     \tl_gset_eq:cN { g__mark_ #1 _first_ ##1 _tl }
216     \c__mark_empty_tl
217     \tl_gset_eq:cN { g__mark_ #1 _last_ ##1 _tl }
218     \c__mark_empty_tl
219   }
220 }
```

(End of definition for `\mark_clear_structure:n`. This function is documented on page 1012.)

`\mark_set_structure_to_err:n` A slight variation is to install a fixed error message as the value.

```
221 \cs_new_protected:Npn \mark_set_structure_to_err:n #1 {
222   \seq_map_inline:Nn \g__mark_classes_seq
223   {
224     \tl_gset:ce { g__mark_ #1 _top_ ##1 _tl } { \__mark_value:nn{?}{\__mark_error:nn {#1}}
225     \tl_gset:ce { g__mark_ #1 _first_ ##1 _tl } { \__mark_value:nn{?}{\__mark_error:nn {#1}}
226     \tl_gset:ce { g__mark_ #1 _last_ ##1 _tl } { \__mark_value:nn{?}{\__mark_error:nn {#1}}
227   }
228 }
```

Given that this is used in only one place, we could hardwire the argument which would be a bit more compact, but who knows, perhaps we end up with another reason to use this error command elsewhere, so for now we keep the argument.

```
229 \cs_new_protected:Npn \__mark_error:nn #1#2 {
230   \msg_error:nnnn { mark } { invalid-use } {#1} {#2}
231 }
```

(End of definition for `\mark_set_structure_to_err:n` and `__mark_error:n`. This function is documented on page 1011.)

8.3 Placing and retrieving marks

\mark_insert:nn This function puts a mark for some $\langle class \rangle$ at the current point.

```
232 \cs_new_protected:Npn \mark_insert:nn #1#2
233 {
234   \seq_if_in:NnTF \g__mark_classes_seq {#1}
235 }
```

We need to pass the evaluated argument into the mark but protected commands should not expand including those protected using the \protect approach of L^AT_EX 2_E. We also disable \label and the like.⁵⁰

At this point the code eventually should get a public (and a kernel) hook instead of a set of hardwired settings.

```
236 \group_begin:
```

Within the group we alter some comments, e.g., \label or \index, to do the right at this point. This is done in the kernel hook \@kernel@before@insertmark which is followed by the public hook insertmark that can be used by packages to augment or alter that setup as necessary.

```
237     \@kernel@before@insertmark
238     \hook_use:n { insertmark }
239     \unrestored@protected@xdef \g__mark_tmp_tl
240     {
```

To ensure that marks are unique we insert a hidden sequence marker at the beginning of the content of the mark containing the sequence number of the mark.

```
241         \__mark_value:nn{ \int_use:N\g__mark_int }{#2}
242     }
243 \begin{trace}
244     \__mark_debug:n{ \iow_term:x { Marks:~ set~#1~->-
245                     '\tl_to_str:V \g__mark_tmp_tl' ~ \msg_line_context: } }
246 \end{trace}
247 \tex_marks:D \use:c { c__mark_class_ #1 _mark }
248 {
```

Here is the trick to avoid truly empty marks: if the result from the above processing is empty we add something which eventually becomes empty, but not immediately; otherwise we just put \g__mark_tmp_tl in.

```
249 % This is no longer needed with 1.0f
250 %
251 %           \tl_if_empty:NTF \g__mark_tmp_tl
252 %             { \exp_not:n { \prg_do_nothing: } }
253 %             { \exp_not:o { \g__mark_tmp_tl } }
254 %             \exp_not:o { \g__mark_tmp_tl }
255 %
256 \group_end:
```

A mark introduces a possible break point and in certain situations that should not happen in vertical mode in L^AT_EX. This may need some checking and possibly cleanup

```
256     \if@nobreak\ifvmode\nobreak\fi\fi
257 }
```

⁵⁰Straight copy from `latex.ltx` but is this even correct? At least a label in a running header makes little sense if it gets set several times! Maybe that needs looking at in the 2e kernel.

If the mark class was not known, raise an error.

```
258     {
259         \msg_error:nnx { mark } { unknown-class }
260         { \tl_to_str:n {#1} }
261     }
262 }
```

(End of definition for `\mark_insert:nn`. This function is documented on page 1004.)

`__mark_value:nn`

A hidden marker is placed into every mark added by `\mark_insert:nn`. It will not show up in the output but its argument (a counter value that is incremented) makes all marks unique so the test for “equal” is not fooled by two different marks having the same mark text.

```
263 \cs_new_protected:Npn \__mark_value:nn #1#2 { #2 }
```

(End of definition for `__mark_value:nn`.)

`\@kernel@before@insertmark`

`insertmark`

```
264 \int_new:N \g__mark_int
265 \cs_new:Npn \@kernel@before@insertmark {
266     \cs_set_eq:NN \label \scan_stop:
267     \cs_set_eq:NN \index \scan_stop:
268     \cs_set_eq:NN \glossary \scan_stop:
```

We count each mark and use that to place a hidden marker in front of the mark text. To ensure that there is no overflow (very unlikely but you never know) we restart every 100000 marks. Thus, if somebody puts more than that number of marks on a single page you could construct a scenario in which that approach fails.

```
269 \int_compare:nNnTF \g__mark_int < {99999}
270     { \int_gincr:N \g__mark_int }
271     { \int_gzero:N \g__mark_int }
272
273 }
```

The public hook to augment the setup.

```
274 \hook_new:n {insertmark}
```

(End of definition for `\@kernel@before@insertmark` and `insertmark`.)

`\mark_use_top:nn` `\mark_use_first:nn` `\mark_use_last:nn`

To retrieve the first, last or top region mark, we grab the appropriate value stored in the corresponding token list variable and pass its contents back. These functions should be used only in output routines and only after `\mark_update_structure_from_material:nn` has acted, otherwise their value will be wrong.

```
275 \cs_new:Npn \mark_use_first:nn #1#2 { \__mark_use_check:nnn { g__mark_#1_first_#2_tl } {#1} {#2} }
276 \cs_new:Npn \mark_use_last:nn #1#2 { \__mark_use_check:nnn { g__mark_#1_last_#2_tl } {#1} {#2} }
277 \cs_new:Npn \mark_use_top:nn #1#2 { \__mark_use_check:nnn { g__mark_#1_top_#2_tl } {#1} {#2} }
```

If used with an unknown class or region these commands will generate an error. If that happens in an expandable context then the error generation is delayed (e.g., if used in a `\section`) and happens when the code is finally used in typesetting, e.g., in the TOC or a running header. If used in a `\typeout` you only see something like `__mark_error:n{page}`. This is not too good, but probably better than low-level errors, I guess, and I don’t want to use an expandable error because of the size restrictions in such error messages.

```

278 \cs_new:Npn \__mark_use_check:n { #1#2#3 {
279   \tl_if_eq:cNTF {#1} \relax
280   { \__mark_error:nn {#2} {#3} }
281   { \__mark_drop_id:v {#1} }
282 }
```

Each mark starts with an id and while the id does not print it is nevertheless better to remove it when returning the mark, so that downstream manipulation of the data doesn't have to deal with it. This is what the `\exp_not:o` accomplishes.

```

283 \cs_new:Npn \__mark_drop_id:n { \exp_not:o { #1 } }
284 \cs_generate_variant:Nn \__mark_drop_id:n { o, v }
```

(End of definition for `\mark_use_top:nn`, `\mark_use_first:nn`, and `\mark_use_last:nn`. These functions are documented on page 1005.)

8.4 Comparing mark values

`\mark_if_eq:nnnnTF` Test if in a given region (#1) for a given class (#2) the marks in position #3 and #4 (top, first, or last) are identical
`\mark_if_eq:nnnnnnTF`

```

285 \prg_new_conditional:Npnn \mark_if_eq:nnnn #1#2#3#4 { T , F , TF }
286 {
287   \tl_if_eq:ccTF { g__mark_ #1 _#3_ #2 _tl }
288   { g__mark_ #1 _#4_ #2 _tl }
289   \prg_return_true:
290   \prg_return_false:
291 }
```

The fully general test (with two triplets of the form `<region>`, `<class>`, and `<position>`) is this:

```

292 \prg_new_conditional:Npnn \mark_if_eq:nnnnnn #1#2#3#4#5#6 { T , F , TF }
293 {
294   \tl_if_eq:ccTF { g__mark_ #1 _#3_ #2 _tl }
295   { g__mark_ #4 _#6_ #5 _tl }
296   \prg_return_true:
297   \prg_return_false:
298 }
```

(End of definition for `\mark_if_eq:nnnnTF` and `\mark_if_eq:nnnnnnTF`. These functions are documented on page 1005.)

8.5 Messages

Mark errors are L^AT_EX kernel errors:

```

299 \prop_gput:Nnn \g_msg_module_type_prop { mark } { LaTeX }
300 \msg_new:nnnn { mark } { class-already-defined }
301 { Mark-class-'#1'-already-defined }
302 {
303   \c__msg_coding_error_text_tl
304   LaTeX-was~asked~to~define~a~new~mark~class~called~'#1':~
305   this~mark~class~already~exists.
306   \c__msg_return_text_tl
307 }
```

```

308 \msg_new:nnnn { mark } { unknown-class }
309   { Unknown-mark-class-'#1'. }
310   {
311     \c__msg_coding_error_text_tl
312     LaTeX-was-asked-to-manipulate-a-mark-of-class-'#1',-
313     but-this-class-of-marks-does-not-exist.
314   }

```

The next error can also happen if the mark class is unknown, so this should perhaps be separated into two different errors.

```

315 \msg_new:nnnn { mark } { invalid-use }
316   { Mark-region-'#1'-not-usuable-or-class-'#2'-unknown }
317   {
318     \c__msg_coding_error_text_tl
319     The-region-'#1'-is-either-not-known-or-data-for-it-
320     still-needs-to-be-assembled, e.g., last-column-
321     while-building-the-first-column.
322     Also-possible:-the-class-namne-'#2'-is-misspelled.
323     \c__msg_return_text_tl
324   }

```

8.6 Debugging the mark structures

Code and commands in this section are not final, it needs more experimentation to see what kind of tracing information is going to be useful in practice. For now the tracing is mainly meant to be used for code testing and not so much for application testing.

It is quite likely that the commands and the behavior of the tracing might change in the future once we gained some experience with it.

`\g__mark_debug_bool` Holds the current debugging state.

```
325 \bool_new:N \g__mark_debug_bool
```

(End of definition for `\g__mark_debug_bool`.)

`\mark_debug_on:` Turns debugging on and off by redefining `__mark_debug:n`.
`\mark_debug_off:` `__mark_debug:n`
`__mark_debug_gset:`

```

326 \cs_new_eq:NN \__mark_debug:n \use_none:n
327 \cs_new_protected:Npn \mark_debug_on:
328   {
329     \bool_gset_true:N \g__mark_debug_bool
330     \__mark_debug_gset:
331   }
332 \cs_new_protected:Npn \mark_debug_off:
333   {
334     \bool_gset_false:N \g__mark_debug_bool
335     \__mark_debug_gset:
336   }
337 \cs_new_protected:Npn \__mark_debug_gset:
338   {
339     \cs_gset_protected:Npx \__mark_debug:n ##1
340       { \bool_if:NT \g__mark_debug_bool {##1} }
341   }

```

(End of definition for `\mark_debug_on:` and others. These functions are documented on page 1008.)

```
\DebugMarksOn CamelCase commands for debugging.
\DebugMarksOff 342 \cs_new_eq:NN \DebugMarksOn  \mark_debug_on:
343 \cs_new_eq:NN \DebugMarksOff  \mark_debug_off:
```

(End of definition for \DebugMarksOn and \DebugMarksOff. These functions are documented on page 1008.)

__mark_class_status:nnn Shows the mark values across all regions for one mark class (#2).
The first argument gives some *<info>* to help in identifying where the command was called, the second is the class and the third holds the number of `mcol-...` we should display: inside a `multicols` environment this will be `\col@number`, in L^AT_EX's normal output routines it will be 0.

```
344 (*trace)
345 \cs_new_protected:Npn \__mark_class_status:nnn #1#2#3 {
346   \typeout{ Marks:#2~ #1:}
347   \__mark_region_status:nnn {#2}{ page~ (previous) } { previous-page }
348   \__mark_region_status:nnn {#2}{ page~ (current)~ } { page }
349   \__mark_region_status:nnn {#2}{ column~ (previous) } { previous-column }
350   \__mark_region_status:nnn {#2}{ column~ (current)~ } { column }
351   \__mark_region_status:nnn {#2}{ column~ (first) } { first-column }
352   \__mark_region_status:nnn {#2}{ column~ (last)~ } { last-column }
```

Then finish by displaying a subset of the `mcol-...` regions: none (0) in the standard L^AT_EX output routine and `\col@number` within a `multicols` environment.

```
353 \int_step_inline:nn {#3}
354   {
355     \__mark_region_status:nnn {#2}{ column~ (##1)~ } { mcol-##1 }
356   }
357 }
```

(End of definition for __mark_class_status:nnn.)

__mark_region_status:nnn Display the top, first, and last mark of a region unless none of them exist or all of them are empty.

```
358 \cs_new_protected:Npn \__mark_region_status:nnn #1#2#3 {
359   \group_begin:
360   \cs_set:Npn \__mark_value:nn ##1##2{ \exp_not:n{ {##1} ~ ##2 } }
361   \tl_if_exist:cT { g__mark_#3_last_ #1 _tl }
362   {
363     \tl_if_eq:cNF { g__mark_#3_last_ #1 _tl } \c__mark_empty_tl
364     {
365       \typeout{@spaces #2 =
366           ~|~ \use:c { g__mark_#3_top_ #1 _tl } ~|~
367           \use:c { g__mark_#3_first_ #1 _tl } ~|~
368           \use:c { g__mark_#3_last_ #1 _tl } ~|~
369     }
370   }
371 }
372 \group_end:
373 }
```

(End of definition for __mark_region_status:nnn.)

`__mark_status:nn` Show a snapshot of all mark class values across all regions. The first argument is a string to identify the output, the second argument is the number of `mcol-...` regions to show. Outside of a `multicols` environment this is normally set to 0.

```

374 \cs_new_protected:Npn \__mark_status:nn #1#2
375   {
376     \seq_map_inline:Nn \g__mark_classes_seq
377     { \__mark_class_status:nnn {#1} {##1} {#2} }
378   }
379 
```

(End of definition for `__mark_status:nn`.)

`\ShowMarksAt` Debugging helper that displays a snapshot of all known mark structures. The first argument is a text string that is displayed to help identifying when the snapshot was made. The optional second one determines how many `mcol-...` regions are displayed (by default 4).

This may not stay like this (or at all), which is why it isn't yet documented as an official command.

```

380 \NewDocumentCommand \ShowMarksAt {m O{4}} {
381   <*trace>
382   \__mark_debug:n { \__mark_status:nn {#1}{#2} }
383   
```

(End of definition for `\ShowMarksAt`.)

8.7 Designer-level interfaces

`\NewMarkClass` These two are identical to the L3 programming layer commands.

`\InsertMark`

```

385 \cs_new_eq:NN \NewMarkClass \mark_new_class:n
386 @onlypreamble \NewMarkClass
387 \cs_new_eq:NN \InsertMark \mark_insert:nn

```

(End of definition for `\NewMarkClass` and `\InsertMark`. These functions are documented on page 1004.)

`\TopMark` The following commands take an optional argument that defaults to page. There is no checking that the region is actually valid. If not there is simply an empty return.

`\FirstMark`

`\LastMark`

```

388 \NewExpandableDocumentCommand \FirstMark { O{page} m }
389   { \mark_use_first:nn {#1}{#2} }

390 \NewExpandableDocumentCommand \LastMark { O{page} m }
391   { \mark_use_last:nn {#1}{#2} }

392 \NewExpandableDocumentCommand \TopMark { O{page} m }
393   { \mark_use_top:nn {#1}{#2} }

```

(End of definition for `\TopMark`, `\FirstMark`, and `\LastMark`. These functions are documented on page 1005.)

\IfMarksEqualTF We only provide CamelCase commands for the case with one region (optional) and one class. One could think of also providing a version for the general case with several optional arguments, but use cases for this are most likely rare, so not done yet.

```

394 \NewExpandableDocumentCommand \IfMarksEqualTF {0{page}mmm} {
395   \mark_if_eq:nnnnTF {#1}{#2}{#3}{#4}
396 }
397 \NewExpandableDocumentCommand \IfMarksEqualT {0{page}mmm} {
398   \mark_if_eq:nnnnT {#1}{#2}{#3}{#4}
399 }
400 \NewExpandableDocumentCommand \IfMarksEqualF {0{page}mmm} {
401   \mark_if_eq:nnnnF {#1}{#2}{#3}{#4}
402 }
```

(End of definition for \IfMarksEqualTF, \IfMarksEqualT, and \IfMarksEqualF. These functions are documented on page 1005.)

9 L^AT_EX 2 _{ϵ} integration

9.1 Core L^AT_EX 2 _{ϵ} integration

_mark_update_singlecol_structures: This command updates the mark structures if we are producing a single column document.

```
403 \cs_new_protected:Npn \_mark_update_singlecol_structures: {
```

First we update the page region (which also updates the previous-page).

The \Coutputbox is normally in \vbox in L^AT_EX but we can't take that for granted (an amsmath test document changed it to an \hbox just to trip me up) so we are a little careful with unpack now.

```

404 \box_if_vertical:NTF \Coutputbox
405   {
406     \mark_update_structure_from_material:nn {page}
407     { \vbox_unpack:N \Coutputbox }
408   }
409   {
410     \mark_update_structure_from_material:nn {page}
411     { \hbox_unpack:N \Coutputbox }
412   }
```

Then we provide the necessary updates for the aliases.

```

413 \mark_copy_structure:nn {previous-column}{previous-page}
414 \mark_copy_structure:nn {column}{page}
415 \mark_copy_structure:nn {first-column}{page}
416 \mark_copy_structure:nn {last-column}{page}
417 (*trace)
418 % move this into status itself?
419   \_mark_debug:n
420   {
421     \_mark_status:nn
422     { in~ OR~ (
423       \legacy_if:nTF {@twoside}
424       { twoside-
425         \int_if_odd:nTF \c@page
426         { odd }{ even }
```

```

427          }
428          { oneside }
429      )
430      }
431      {0}
432  }
433 </trace>
434 }

```

(End of definition for `_mark_update_singlecol_structures`.)

`_mark_update_dblcol_structures`: This command handles the updates if we are doing two-column pages.

```
435 \cs_new_protected:Npn \_mark_update_dblcol_structures: {
```

First we update the `column` and `previous-column` regions using the material assembled in `\@outputbox`.

```

436   \box_if_vertical:NTF \@outputbox
437   {
438     \mark_update_structure_from_material:nn {column}
439     { \vbox_unpack:N \@outputbox }
440   }
441   {
442     \mark_update_structure_from_material:nn {column}
443     { \hbox_unpack:N \@outputbox }
444   }

```

How we have to update the alias regions depends on whether or not `\@copcol` was called to process the first column or to produce the completed page

```
445 \legacy_if:nTF {@firstcolumn}
446 {
```

If we are processing the first column then `column` is our `first-column` and there is no `last-column` yet, so we make those an error.

```

447   \mark_copy_structure:nn {first-column}{column}
448   \mark_set_structure_to_err:n {last-column}
449 }
450 {
```

If we produce the completed page then the `first-column` is the same as the new `previous-column`. However, the structure should already be correct if you think about it (because it was set to `column` last time which is now the `previous-column`), thus there is no need to make an update.

```
451 % \mark_copy_structure:nn {first-column}{previous-column}
```

However, we now have a proper `last-column` so we assign that.

```
452 \mark_copy_structure:nn {last-column}{column}
```

What now remains doing is to update the `page` and `previous-page` regions. For this we have to copy the settings in `page` into `previous-page` and then update `page` such that the top and first marks are taken from the `first-column` region and the last marks are taken from the `last-column` region. All this has to be done for all mark classes so we loop over our sequence.

Note that one loop is needed if we arrange the copy statements in a suitable way.

```
453 \seq_map_inline:Nn \g_mark_classes_seq
454 {
```

The `previous-page` updates need to come before the updates for `page` region because otherwise the values to copy are already overwritten. necessary values.

```

455          \tl_gset_eq:cc { g__mark_previous-page_top_ ##1 _tl }
456          { g__mark_page_top_ ##1 _tl }
457          \tl_gset_eq:cc { g__mark_previous-page_first_ ##1 _tl }
458          { g__mark_page_first_ ##1 _tl }
459          \tl_gset_eq:cc { g__mark_previous-page_last_ ##1 _tl }
460          { g__mark_page_last_ ##1 _tl }

```

To update the `top` we only have to copy what is in `first-column`:

```

461          \tl_gset_eq:cc { g__mark_page_top_ ##1 _tl }
462          { g__mark_first-column_top_ ##1 _tl }
463

```

Updating the `first` mark for the `page` region is more complicated. We first have to find out of there is any mark in the first column (this can be done by comparing the `top` and the `first` mark of that region).

```

464          \tl_if_eq:ccTF { g__mark_first-column_top_ ##1 _tl }
465          { g__mark_first-column_first_ ##1 _tl }
466

```

If there is no mark in the first column we copy the first mark of the last column. If that doesn't contain a mark we still get the right result because the first mark is then equal to the top mark.

```

467          \tl_gset_eq:cc { g__mark_page_first_ ##1 _tl }
468          { g__mark_last-column_first_ ##1 _tl }
469
470

```

On the other hand, if there is a mark in the first column we copy over the `first` mark from that column.

```

471          \tl_gset_eq:cc { g__mark_page_first_ ##1 _tl }
472          { g__mark_first-column_first_ ##1 _tl }
473

```

The logic for the `last` page mark is again simple, we can just copy the value in the `last` mark of the last column. If that column doesn't contain any marks, then the value in `last` will be automatically the same as the `last` from the first column.

```

474          \tl_gset_eq:cc { g__mark_page_last_ ##1 _tl }
475          { g__mark_last-column_last_ ##1 _tl }
476
477      }
478 (*trace)
479      \__mark_debug:n
480      {
481          \__mark_status:nn
482          { in~ OR~ (
483              \legacy_if:nTF {@twoside}
484              { twoside-
485                  \int_if_odd:nTF \c@page
486                  { odd }{ even }
487              }
488              { oneside }
489              \space
490              \legacy_if:nTF {@firstcolumn}

```

```

491           { first~ }{ second~ }
492           column )
493       }
494   {0}
495 }
496 </trace>
497 }

```

(End of definition for `__mark_update_dblcol_structures::`)

9.2 Other L^AT_EX 2 _{ϵ} output routines

This section will cover support for packages that alter the L^AT_EX output routine (as necessary). The support for `multicol` (for now) is handled directly in that package.

```
498 <@=
```

\@expl@@@mark@update@singlecol@structures@@

```

499 \cs_new_eq:NN \@expl@@@mark@update@singlecol@structures@@
500   \__mark_update_singlecol_structures:

```

(End of definition for `\@expl@@@mark@update@singlecol@structures@@`.)

\@expl@@@mark@update@dblcol@structures@@

```

501 \cs_new_eq:NN \@expl@@@mark@update@dblcol@structures@@
502   \__mark_update_dblcol_structures:

```

(End of definition for `\@expl@@@mark@update@dblcol@structures@@`.)

9.3 Rollback information

```

503 <latexrelease>\IncludeInRelease{0000/00/00}{\ltmarks}%
504 <latexrelease>          {Undo-Marks-handling}%
505 <latexrelease>

```

We keep the interface commands around even if we roll back in case they are used in packages that don't roll back. Not likely to do a lot of good, but then there is not much we can do, but this at least they won't give unknown csname errors.

```

506 <latexrelease>\DeclareRobustCommand \NewMarkClass[1]{}
507 <latexrelease>\DeclareRobustCommand \InsertMark[2]{}
508 <latexrelease>\RenewExpandableDocumentCommand \FirstMark { 0{} m } { }
509 <latexrelease>\RenewExpandableDocumentCommand \LastMark { 0{} m } { }
510 <latexrelease>\RenewExpandableDocumentCommand \TopMark { 0{} m } { }
511 <latexrelease>\RenewExpandableDocumentCommand \IfMarksEqualTF { 0{} mmm }{ }
512 <latexrelease>

```

Same here, this avoided extra roll back code in the OR.

```

      Reset module prefix:
520 <@=
```

File 49

ltpage.dtx

1 Page styles and related commands

1.1 Page Style Commands

\pagestyle{\{style\}} : sets the page style of the current and succeeding pages to *style*
\thispagestyle{\{style\}} : sets the page style of the current page only to *style*.
To define a page style *style*, you must define \ps@*style* to set the page style parameters.

1.2 How a page style makes running heads and feet

The \ps@... command defines the macros \oddhead, \oddfoot, \evenhead, and \evenfoot to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, etc., where \chaptermark{\{text\}} is called by \chapter to set a mark. The \...mark commands and the \...head macros are defined with the help of the following macros.

(All the \...mark commands should be initialized to no-ops.)

1.3 marking conventions

LATEX extends TEX's \mark facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

\markboth{\{left\}}{\{right\}} : Adds both marks.

\markright{\{right\}} : Adds a 'right' mark.

\leftmark : Used in the output routine, gets the current 'left' mark. Works like TEX's \botmark.

\rightmark : Used in the output routine, gets the current 'right' mark. Works like TEX's \firstmark. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a \chapter command and the right mark is changed by a \section command. However, it does produce somewhat anomalous results if 2 \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \cmkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \gobbletwo to do nothing.

1 <*2ekernel>

\pagestyle User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}}
```

(End of definition for \pagestyle.)

\thispagestyle User command to set the page style for this page only.

```
6 \def\thispagestyle#1{%
7   \@ifundefined{ps@#1}%
8     \undefinedpagestyle
9     {\global\@specialpagetrue\gdef\@specialstyle{#1}}}
```

(End of definition for \thispagestyle.)

\ps@empty The empty page style: No head or foot line.

```
10 \def\ps@empty{%
11   \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12   \let\@evenhead\@empty\let\@evenfoot\@empty}
```

(End of definition for \ps@empty.)

\ps@plain The plain page style: No head, centred page number in foot.

```
13 \def\ps@plain{\let\@mkboth\@gobbletwo
14   \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15   \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
```

(End of definition for \ps@plain.)

\@leftmark \rightmark We implement \@leftmark and \@rightmark in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.

```

File 50

ltclass.dtx

1 Introduction

This file implements the following declarations, which replace `\documentstyle` in L^AT_EX 2 _{ε} documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between L^AT_EX 2 _{ε} and L^AT_EX2.09 is that L^AT_EX 2 _{ε} packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

2 User interface

```
\documentclass[<main-option-list>]{<class>}[<version>]
```

There must be exactly one such declaration, and it must come first. The `<main-option-list>` is a list of options which can modify the formatting of elements which are defined in the `<class>` file as well as in all following `\usepackage` declarations (see below). The `<version>` is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

```
\documentstyle[<main-option-list>]{<class>}[<version>]
```

The `\documentstyle` declaration is kept in order to maintain upward compatibility with L^AT_EX2.09 documents. It is similar to `\documentclass`, but it causes all options in `<main-option-list>` that the `<class>` does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in L^AT_EX2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors L^AT_EX generates. This flag does affect the definition of font commands, and `\sloppy`.

```
\usepackage[<package-option-list>]{<package-list>}[<version>]
```

There can be any number of these declarations. All packages in `<package-list>` are called with the same options.

Each `<package>` file defines new elements (or modifies those defined in the `<class>`), and thus extends the range of documents which can be processed. The `<package-option-list>` is a list of options which can modify the formatting of elements defined in the `<package>` file. The `<version>` is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the *<package-option-list>*, each package processes the *<main-option-list>*. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

`filecontents (env.)`

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of TeX. Finally, you can use `noheader` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

2.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

3 Class and Package interface

3.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{\name}{\version}` command. The `\version` should begin with a date in the format YYYY/MM/DD.

3.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{\name}{\version}` command. The `\version` should begin with a date in the format YYYY/MM/DD.

3.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[\options]{\name}{\version}`.

If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage[\options]{\package}`.

`\PassOptionsToClass` This adds the `\options` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{\name}{\version}`:

This is similar to `\LoadClass`, but it always calls class `\name` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`. `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

`\IfPackageLoadedTF` To find out if a package has already been loaded, use
`\IfClassLoadedTF` or the old name `\@ifpackageloaded`.
`\@ifpackageloaded`
`\@ifclassloaded`
`\IfPackageAtLeastTF` To find out if a package has already been loaded with a version equal to or more recent than `\langle date \rangle`, use
`\IfClassAtLeastTF`
`\IfFileAtLeastTF` or the old name `\@ifpackagelater`.
`\@ifpackagelater`
`\@ifclasslater` or the old name `\@ifpackagelater`.
`\IfFormatAtLeastTF` To test the format date use

`\IfFormatAtLeastTF{\langle date \rangle}{\langle true \rangle}{\langle false \rangle}`

`\IfPackageLoadedWithOptionsTF` To find out if a package has already been loaded with at least the options `\langle options \rangle`,
`\IfClassLoadedWithOptionsTF` use
`\@ifpackagewith`
`\@ifclasswith` or the old name `\@ifpackagewith`.

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

3.4 Declaring new options

Options for classes and packages are built using the same macros.

`\DeclareOption` To define a builtin option, use `\DeclareOption{\langle name \rangle}{\langle code \rangle}`.
`\DeclareOption*` To define the default action to perform for local options which have not been declared, use `\DeclareOption*{\langle code \rangle}`.
Note: there should be no use of
`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.
Possible uses for `\DeclareOption*` include:
`\DeclareOption*{}`
Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)
`\DeclareOption*{\@unkownoptionerror}`
Complain about unknown local options. (The initial setting for package files.)
`\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{\pkg-name}}`
Handle the current option by passing it on to the package `\langle pkg-name \rangle`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building

‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```
\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%
{}%
{\OptionNotUsed}}
```

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

3.5 Safe Input Macros

<code>\InputIfFileExists</code>	<code>\InputIfFileExists{\file}{\then}{\else}</code>
	Inputs <code>\file</code> if it exists. Immediately before the input, <code>\then</code> is executed. Otherwise <code>\else</code> is executed.
<code>\IfExists</code>	As above, but does not input the file.
	One thing you might like to put in the <code>\else</code> clause is
<code>\@missingfileerror</code>	This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering <code>x</code> quits the current run,
<code>\input</code>	This has been redefined from the L ^A T _E X2.09 definition, in terms of the new commands <code>\InputIfFileExists</code> and <code>\@missingfileerror</code> .
<code>\listfiles</code>	Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to <code>\ProvidesPackage</code> are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

4 Implementation

	<code>1 <*2ekernel></code>
<code>\if@compatibility</code>	The flag for compatibility mode.
	<code>2 \newif\if@compatibility</code>
	<i>(End of definition for \if@compatibility.)</i>
<code>\@documentclasshook</code>	This legacy hook is called after the first <code>\documentclass</code> command. It is <i>not</i> integrated with the new 2020 hook management system! By default this checks to see if <code>\@normalsize</code> is undefined, and if so, sets it to <code>\normalsize</code> .
	<code>3 \def\@documentclasshook{% 4 \ifx\@normalsize\@undefined 5 \let\@normalsize\normalsize 6 \fi 7 }</code>
	<i>(End of definition for \@documentclasshook.)</i>
<code>\@declaredoptions</code>	This list is automatically built by <code>\DeclareOption</code> . It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the corresponding <code>\ds@\option</code> commands are executed. All local <code>\option</code> s which are not declared will be processed in the order defined by the optional argument of <code>\documentclass</code> or <code>\usepackage</code> .
	<code>8 \let\@declaredoptions\empty</code>

(End of definition for \@declaredoptions.)

\@classoptionslist List of options of the main class.

```
 9  \let\@classoptionslist\relax  
10  \%@\onlypreamble\@classoptionslist
```

(End of definition for \@classoptionslist.)

\@raw@classoptionslist List of options of the main class (unprocessed).

```
11  \let\@raw@classoptionslist\relax
```

(End of definition for \@raw@classoptionslist.)

\@unusedoptionlist List of options of the main class that haven't been declared or loaded as class option files.

```
12  \let\@unusedoptionlist\@empty  
13  \%@\onlypreamble\@unusedoptionlist
```

(End of definition for \@unusedoptionlist.)

\CurrentOption Name of current package or option.

```
14  \let\CurrentOption\@empty
```

(End of definition for \CurrentOption.)

\@currpath Path to the current file if explicitly given.

```
15  </2ekernel>  
16  <*2ekernel | latexrelease>  
17  <latexrelease>  
18  <latexrelease>\IncludeInRelease{2020/10/01}{\@currpath}%  
19  <latexrelease> {Add \@currpath} %  
20  \let\@currpath\@empty  
21  <latexrelease>\EndIncludeInRelease  
22  %  
23  <latexrelease>\IncludeInRelease{0000/00/00}{\@currpath}%  
24  <latexrelease> {Add \@currpath} %  
25  <latexrelease>\let\@currpath\undefined  
26  <latexrelease>\EndIncludeInRelease  
27  </2ekernel | latexrelease>  
28  <*2ekernel>
```

(End of definition for \@currpath.)

\@currname Name of current package or option.

```
29  \let\@currname\@empty
```

(End of definition for \@currname.)

\@currext The current file extension.

```
30  \global\let\@currext=\@empty
```

(End of definition for \@currext.)

\@clsextension The two possible values of \@currext.

\@pkgextension
31 \def\@clsextension{cls}
32 \def\@pkgextension{sty}

(End of definition for \clsextension and \pkgextension.)

```
\@pushfilename Commands to push and pop the file name and extension.  
  \@popfilename #1 current name.  
\currnamestack #2 current extension.  
          #3 current catcode of @.  
          #4 Rest of the stack.  
          33 </2ekernel>  
          34 {*2ekernel | latexrelease}  
          35 {latexrelease}  
          36 {<tex>\IncludeInRelease{2020/10/01}{\@pushfilename}}%  
          37 {<tex> {Add \@expl@push@filename@@ and \@expl@push@filename@aux@@}}%  
          38 {\def{\@pushfilename}{%}
```

The push and pop macros are injected in \@pushfilename and \@popfilename so that they correctly keep track of the hook labels.

This needs cleanup with the expl3 interfaces also playing here, e.g., \@expl@push@filename@@ needs cleanup and (and should probably not have this name either).

```
39  \@expl@push@filename@@  
40  \xdef{\currnamestack}{%  
41   {\@currname}}%  
42   {\@currext}}%  
43   {\the\catcode`@}}%  
44 }%
```

Temporarily add a stack for \currpath here. This should be integrated in the main file stack eventually, but other packages rely on \currnamestack having three elements per file, so that isn't a trivial change. The prefix \@kernel@... hopefully discourages people from using it.

```
45  \xdef{\kernel@currpathstack}{%  
46   {\currpath}}%  
47   {\kernel@currpathstack}}%  
48   {\expl@push@filename@aux@@}  
49 {<tex>\EndIncludeInRelease
```

The following version of \@pushfilename didn't formally exist in this file, but in the 2020/02/02 release, expl3 was preloaded and it patched \@pushfilename (and \@popfilename) by adding some hooks in there. But rolling back to 2020/02/02, expl3 doesn't patch these macros again, so rolling back has to take those hooks into account. Same goes for \@popfilename.

```
50 {<tex>  
51 {<tex>\IncludeInRelease{2020/02/02}{\@pushfilename}}%  
52 {<tex> {Add \@expl@push@filename@@}}%  
53 {<tex>\def{\@pushfilename}{%  
54 {<tex> {\expl@push@filename@@}  
55 {<tex> \xdef{\currnamestack}{%  
56 {<tex> {\@currname}}%  
57 {<tex> {\@currext}}%  
58 {<tex> {\the\catcode`@}}%

61 {<tex>\EndIncludeInRelease  
62 {<tex>}
```

When we roll back from a release that has `\expl3` preloaded, the definitions of `\@pushfilename` and `\@popfilename` can't be completely rolled back otherwise `\ExplSyntaxOff`-based packages won't have the automatic `\ExplSyntaxOff` at the end. Here and below for `\@popfilename`, we don't roll back all the way through if coming from L^AT_EX > 2020 – 02 – 02.

```

122  \onlypreamble\@currnamestack

```

(End of definition for \@pushfilename, \@popfilename, and \@currnamestack.)

\@kernel@\currpathstack Path to the current file if explicitly given. The auxiliary is needed here to insert a \empty to prevent the loss of braces.

```

123  {/2ekernel}
124  {*2ekernel | latexrelease}
125  \def\@currpathstack{%
126  \IncludeInRelease{2020/10/01}{\@kernel@\currpathstack}%
127  {Add \@kernel@\currpathstack}%

```

If rolling backwards to this release, \@kernel@\currpathstack will be defined, so the \gdef line should not be executed, thus the \@gobblethree will take it out, so the stack isn't touched.

```

128  \IfUndefined{\@kernel@\currpathstack}{}{\@gobblethree}
129  \gdef\@kernel@\currpathstack{}%

```

If rolling forward to this release, then the \gdef line above will define the path stack to be empty (which it can't be, inside a file), so the code below will traverse the \@currnamestack, and add as many empty items to \@kernel@\currpathstack as there are items in \@currnamestack, so both are back in sync. Most of the time latexrelease is loaded on top-level, so only one item is needed, but platexrelease loads it internally, so the more complicated loop is needed.

```

`\default@ds` The default option code. Set by `\onefilewithoptions` to either `\OptionNotUsed` for classes, or `\unknownonerror` for packages. This may be reset in either case with `\DeclareOption*`.

```
536 % \let\default@ds\OptionNotUsed
```

(End of definition for `\default@ds`.)

`\ProcessOptions` `\ProcessOptions*` `\ProcessOptions` calls `\ds@option` for each known package option, then calls `\default@ds` for each option on the local options list. Finally resets all the declared options to `\relax`. The empty option does nothing, this has to be reset on the off chance it's set to `\relax` if an empty element gets into the `\@declaredoptions` list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of @.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```

This macro is used when loading packages or classes.

\load@onefilewithoptions

```

Have the main argument as #1, so we only need one \expandafter above.

892 〈/2ekernel〉
893 〈*2ekernel | \latexrelease〉
894 〈\latexrelease〉\IncludeInRelease{2020/10/01}%
895 〈\latexrelease〉      {\@onefilewithoptions}{Hooks and unused options issue}%

```

Here this macro is called \@onefilewithoptions, but further ahead in this file it is renamed to \load@onefilewithoptions, and \@onefilewithoptions becomes a wrapper around this, used for bookkeeping when rolling back. Therefore, when in \latexrelease, we need to define \load@onefilewithoptions instead, thus the extra guarded \def line below:

```

896 〈*2ekernel〉
897 \def\@onefilewithoptions#1[#2] [#3]#4{%
898 〈/2ekernel〉
899 〈\latexrelease〉\def\load@onefilewithoptions#1[#2] [#3]#4{%

```

We have to sanitise file names, so that something like

```

\usepackage{some/local/path/array}
\usepackage{array}

```

won't load `array.sty` twice. It is remotely possible that those are two different files, but as a matter of principles, we will consider that the base file name uniquely identifies a package, regardless of where it lives. This assumption already holds for file hooks, for example, which address the hook to a file by its base name only.

We'll use \expl@@@filehook@set@curr@file@nNN to parse the file name and return the `〈path〉` and `〈base+ext〉` in separate token lists. Further ahead, most operations use \currname which doesn't have a path attached to it; only few actions prepend \currpath to \currname (namely loading, as we have to respect the given path).

A file substitution isn't followed just yet because at this point we are parsing user input, so the file is still what the user asked for, and not the file actually loaded.

```

900 \expl@@@filehook@set@curr@file@nNN{#1.#4}\reserved@a\reserved@b
901 \edef\reserved@c{\def\noexpand\reserved@c####1%
902   \detokenize\expandafter{\expanded{. #4}}%
903   \noexpand\@nil{\def\noexpand\reserved@a{\####1}}}\reserved@c
904 \expandafter\reserved@c\reserved@a\@nil
905 \pushfilename
906 \xdef\currname{\string\makeletter\reserved@a}%
907 \xdef\currpath{\ifx\reserved@b\empty\else\reserved@b\fi}%
908 \global\let\currext\@ext

```

The command \ver@〈file〉.〈ext〉 is used to signal that a package is already loaded, either because it is in fact loaded, or because it's loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with \ver@〈file〉.〈ext〉, so before checking if the file exists we have to check that we do need

to load it with `\@ifl@aded`. If we don't, then there's no point in checking for a typo or load-disabling.

```
909  \@ifl@aded\@currname\@currname
```

In the current preferred approach, a key family name will exist for processing using `\ltkeys`. In that case, we replace the previous package options with the new ones, then call the key handler. Otherwise, we use the more classical clash handler.

```
910  {%
911  \@ifundefined{opt@handler@\@currname.\@currname}%
912  {\@onefilewithoptions@clashchk{\#2}}%
913  {%
914  \expandafter\protected@edef
915  \csname opt@\@currname.\@currname\endcsname
916  {\zap@space\#2 \@empty}%
917  \expandafter\def
918  \csname @raw@opt@\@currname.\@currname\expandafter\endcsname
919  \expandafter{\#2}%
920  \nameuse{opt@handler@\@currname.\@currname}%
921  }%
922  }%
923  {\makeatletter
```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```
924  \@reset@ptions
```

First we take the `\<name>` and `\<ext>` given in the argument and check if the file exists, and issue an error otherwise asking for a correction with `\@missingfileerror`. For checking if the file exists we use `\@currpath` (usually empty) before `\@currname`.

```
925  \IfFileExists{\@currpath\@currname.\@currname}{}{%
926  \@missing@onefilewithoptions{\#2}}%
```

If `\@currname` is empty (the user replied to the “Enter file name” prompt with `\<RETURN>`), so stop here (do `\@popfilename` to pop the item just added above).

This `\@gobble` omits the date check at the end.

```
927  \ifx\@currname\@empty
928  \expandafter\@gobble
929  \else
```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with `\@filehook@file@push` then call `\set@curr@file` to set `\@curr@file` (and do any required substitution), then actually load the class/package with `\load@onefile@withoptions`. `\set@curr@file` also needs the file path.

```
930  \@disable@packageload@do{\@currname.\@currname}%
931  {\@expl@@@filehook@file@push@@
932  \set@curr@file{\@currpath\@currname.\@currname}%
933  \@filehook@set@CurrentFile}
```

The `\set@curr@file` line above might have replaced the file, so `\@currname` and `\@currname` may no longer hold the actual package being loaded, so in that case we need to update these two token lists (`\@curr@file` holds the file name after replacement, so we parse that).

The requested file is saved in `\@currpkg@reqd` to be used in `\InputIfFileExists` later: if the updated `\@currname` and `\@currext` are used we lose track of the substitution, so `\CurrentFile` and `\CurrentFileUsed` will be (incorrectly) the same.

```

934          \expandafter\@swaptwoargs\expandafter
935              {\expandafter{\@currpkg@reqd}}%
936              {%
937      \edef\@currpkg@reqd{\@currname.\@currext}%
938      \ifx\CurrentFile\CurrentFileUsed
939      \else
940          \filename@parse\@curr@file
941          \edef\@currpath{\string@makeletter\filename@area}%
942          \edef\@currname{\string@makeletter\filename@base}%
943          \edef\@currext{\string@makeletter\filename@ext}%
944      \fi
945      \load@onefile@withoptions{#2}%
946      \def\@currpkg@reqd{\@currpkg@reqd}%
947  }%

```

Now just clean up and exit.

```

948      \expl@@@filehook@file@pop@@}%
949      \expandafter\@firstofone
950  \fi}%

```

Except in the case where `\@currname` is empty, the date is checked against the date marked in the package file:

```

951  {\@ifl@ter\@currext{\@currname}{#3}{}}%
952    {\@latex@warning@no@line
953      {You have requested,\on@line,
954       version\MessageBreak
955       '#3' of \cls@pkg\space \@currname,\MessageBreak
956       but only version\MessageBreak
957       '\csname ver@\@currname.\@currext\endcsname'\MessageBreak
958       is available}}%
959
960  \ifx\@currext\clsextension\let\LoadClass@twoloadclasserror\fi}%
961  \popfilename
962  \reset@options

```

If the package is already loaded, check that there were no option clashes.

```

962  \def\@onefilewithoptions@clashchk#1{%
963    \@if@ptions\@currext{\@currname}{#1}{}
964    {\@latex@error
965      {Option clash for \cls@pkg\space \@currname}%
966      {The package \@currname\space has already been loaded
967       with options:\MessageBreak
968       \space\space[\optionlist{\@currname.\@currext}]\MessageBreak
969       There has now been an attempt to load it
970       with options\MessageBreak
971       \space\space[#1]\MessageBreak
972       Adding the global options:\MessageBreak
973       \space\space

```

```

974         \optionlist{\@currname.\@currext},#1\MessageBreak
975         to your \noexpand\documentclass declaration may fix this.%  

976         \MessageBreak
977         Try typing \space <return> \space to proceed.}%
978     \@firstofone}

979 \let\@currpkg@reqd\@empty
980 \onlypreamble\onefilewithoptions
    The kernel no longer uses \unprocessedoptions
981 \let\@unprocessedoptions\@undefined

```

Now the action taken when a file is not found. Path must be included here as it eventually leads to a file lookup.

```

982 \def\@missing@onefilewithoptions#1{%
983   \@missingfileerror{\@currpath\@currname}\@currext
984   \global\let\@currpath\@missingfile@area
985   \global\let\@currname\@missingfile@base
986   \global\let\@currext\@missingfile@ext}

```

Now the code that actually does the file loading:

```

\load\onefile@withoptions 987 \def\load@onefile@withoptions#1{%
988   \let\CurrentOption\@empty
989   \reset@options

```

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```

990 \def\reserved@a{%
991   \pass@options\@currext{#1}{\@currname}%
992   \expandafter\let
993     \csname opt@\@currpkg@reqd\expandafter\endcsname
994     \csname opt@\@currname.\@currext\endcsname
995   \expandafter\let
996     \csname @raw@opt@\@currpkg@reqd\expandafter\endcsname
997     \csname @raw@opt@\@currname.\@currext\endcsname
998   \global\expandafter
999   \let\csname ver0\@currname.\@currext\endcsname\@empty

```

We initialize \....-h@k here and only if we load the file so that it remains undefined otherwise.

```
1000 \expandafter\let\csname\@currname.\@currext-h@k\endcsname\@empty
```

When the current extension is \@pkgeextension we are loading a package otherwise, if it is \@clsextension, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```

1001 %-----  

1002 \ifx\@currext\@pkgeextension
1003   \UseHook{package/before}%
1004   \UseOneTimeHook{package/\@currname/before}%
1005 \else
1006   \ifx\@currext\@clsextension
1007     \UseHook{class/before}%
1008     \UseOneTimeHook{class/\@currname/before}%
1009   \fi
1010 \fi

```

Now actually load the file (at this point we are certain it exists, but use `\InputIfFileExists` so that file hooks are executed). `\@currpath` is needed here too.

```
1011  \InputIfFileExists{\@currpath\@currpkg@reqd}{}%
1012  {\@latex@error
1013  {The \@cls@pkg\space\@currpkg@reqd\space failed to load}\@ehd}%
1014 %-----
```

In older versions of the code `\@unprocessedoptions` would generate an error for each specified option in a package unless a `\ProcessOptions` has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interference in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```
1015  \expandafter\let\csname unprocessedoptions-\@currname.\@currext\endcsname
1016  \@@unprocessedoptions
1017  \csname\@currname.\@currext-h@k\endcsname
1018  \expandafter\let\csname\@currname.\@currext-h@k\endcsname
1019  \undefined
```

Catch the case where the packages has handled the options and redefined `\@unprocessedoptions` to `\relax` (old interface). In that case no error should be produced.

```
1020  \ifx\@unprocessedoptions\relax
1021  \let\@unprocessedoptions\undefined
```

Otherwise run the per package set of unused options.

```
1022  \else
1023  \csname unprocessedoptions-\@currname.\@currext\endcsname
1024  \fi
```

In either case we drop the macro afterwards as it is no longer needed.

```
1025  \expandafter\let
1026  \csname unprocessedoptions-\@currname.\@currext\endcsname
1027  \undefined
```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```
1028 %-----
1029 \ifx\@currext\@pkgextension
1030  \UseOneTimeHook{package/\@currname/after}%
1031  \UseHook{package/after}%
1032 \else
1033  \ifx\@currext\@clsextension
1034  \UseOneTimeHook{class/\@currname/after}%
1035  \UseHook{class/after}%
1036 \fi
1037 \fi}%
1038 %-----
1039 \@ifl@aded\@currext\@currname{}{\reserved@a}
```

Now declare the non-generic package and class hooks used above:

```
1040 \NewHook{package/before}
1041 \NewHook{class/before}
1042 \NewReversedHook{package/after}
1043 \NewReversedHook{class/after}
```

```

1044  {/2ekernel | latexrelease}
1045  \end{IncludeInRelease}
1046  \IncludeInRelease{0000/00/00}%
1047  {\@onefilewithoptions}{Hooks and unused options issue}%
1048  \end{IncludeInRelease}

```

Because of the way `\@onefilewithoptions` is changed for rollback handling below we have to define `\load@onefilewithoptions` when rolling back!

```

1049  \def\load@onefilewithoptions#1[#2][#3]{%

4.1 Hooks

Allow code to be saved to be executed at specific later times.

Here we save things in macros. I considered using toks registers (and `\addto@hook` from the NFSS code), but that would require stacking the contents in the case of required packages, so just generate a new macro for each package.

`\@begindocumenthook` Stuff to appear at the beginning or end of the document.

```

1115 \ifx\@begindocumenthook\undefined
1116   \let\@begindocumenthook\emptyset
1117 \fi
1118 \let\@enddocumenthook\emptyset

```

(End of definition for `\@begindocumenthook` and `\@enddocumenthook`.)

`\AtEndOfPackage` The access functions.

```

1119 \def\AtEndOfPackage{%

1138  <latexrelease>
1139  <latexrelease>\EndIncludeInRelease
1140  <*2ekernel>

```

In its initial implementation (not using the hook system) `\AtBeginDocument` was made `\@onlypreamble` because using it later had no effect whatsoever, thus was most certainly an unintended programming error. With the reimplementation, using the `begindocument` hook internally, this has changed because adding to a onetime hook after it has already been used simply executes the additional code immediately. We therefore no longer generate an error if it is used inside the document so that `\AddToHook{begindocument}` and `\AtBeginDocument` are truly equivalent (as claimed in the hook documentation).

```
1141 \% \@onlypreamble\AtBeginDocument
```

(End of definition for `\AtEndOfPackage` and others.)

`\@cls@pkg` The current file type.

5 Package/class rollback mechanism

```

1586 </2ekernel>
1587 {*2ekernel | latexreleasefirst}

```

\pkgcls@debug For testing we have a few extra lines of code that by default do nothing but one can set \pkgcls@debug to \typeout to get extra info. Sometime in the future this will be dropped.

```

1588 {*tracerollback}
1589 \%let\pkgcls@debug\typeout
1590 \let\pkgcls@debug\@gobble
1591 </tracerollback>

```

(End of definition for \pkgcls@debug.)

\requestedLaTeXdate The macro (!) \requestedLaTeXdate holds the globally requested rollback date (via `latexrelease`) or zero if no such request was made.

```

1592 \def\requestedLaTeXdate{0}

```

(End of definition for \requestedLaTeXdate.)

\pkgcls@targetdate If a rollback for a package or class is requested then \pkgcls@targetdate holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of \requestedLaTeXdate) and \pkgcls@targetlabel will be empty. If there was a request for a named version then \pkgcls@targetlabel holds the version name and \pkgcls@targetdate is set to 1.

\pkgcls@targetdate=0 is used to indicate that there was no rollback request. While loading an old release \pkgcls@targetdate is also reset to zero so that \DeclareRelease declarations are bypassed.

In contrast \pkgcls@innerdate will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain `TEX` largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```

1593 \ifx\pkgcls@targetdate\@undefined

```

```

1594   \newcount\pkgcls@targetdate
1595   \fi
1596   \let\pkgcls@targetlabel\@empty
1597   \def\pkgcls@innerdate{\maxdimen}

```

(End of definition for \pkgcls@targetdate, \pkgcls@targetlabel, and \pkgcls@innerdate.)

\pkgcls@candidate When looping through the \DeclareRelease declarations we record if the release is the best candidate we have seen so far. This is recorded in \pkgcls@candidate and we update it whenever we see a better one.

In \pkgcls@releasedate we keep track of the release date of that candidate.

```

1598 \let\pkgcls@candidate\@empty
1599 \let\pkgcls@releasedate\@empty

```

(End of definition for \pkgcls@candidate and \pkgcls@releasedate.)

\load@onefilewithoptions the best place to add the rollback code is at the point where \onefilewithoptions is called to load a single class or package.

To make things easy we save the old definition as \load@onefilewithoptions and then provide a new interface.

Important: as this code is also unconditionally placed into latexrelease we can only do this name change once otherwise both macros will contain the same code.

```

1600 \ifx\load@onefilewithoptions\@undefined
1601   \let\load@onefilewithoptions\onefilewithoptions
1602   \def\onefilewithoptions#1[#2][#3]#4{%

```

First a bit of tracing normally disabled.

```

1603 (*tracerollback)
1604   \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}`}
1605   \pkgcls@debug{@spaces 1: #1}%
1606   \pkgcls@debug{@spaces 2: #2}%
1607   \pkgcls@debug{@spaces 3: #3}%
1608   \pkgcls@debug{@spaces 4: #4}%
1609 
```

Three of the arguments are needed later on in error/warning messages so we save them.

```

1610   \def\pkgcls@name{#1}%           % for info message
1611   \def\pkgcls@arg {#3}%           % for info message
1612   \edef\pkgcls@ext{%
1613     \ifx#4\@clsextension document class\else
1614       \ifx#4\@pkgextension package\else
1615         file
1616       \fi
1617     \fi
1618   }%                           % for info message

```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set \pkgcls@targetdate, \pkgcls@targetlabel and \pkgcls@mindate.

```
1619 \pkgcls@parse@date@arg{#3}%

```

When determining the correct release to load we keep track of candidates in \pkgcls@candidate and initially we don't have any:

```
1620 \let\pkgcls@candidate\@empty

```

If we had a rollback request then #3 may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```

1621  \begingroup
1622  \edef\reserved@a{%
1623  \endgroup
1624  \unexpanded{\load@onefilewithoptions#1[#2]}%
1625  [\pkccls@mindate]%
1626  \unexpanded{#4}%
1627  \reserved@a
1628 }
1629 \fi

```

(End of definition for `\load@onefilewithoptions` and `\onefilewithoptions`.)

`\pkccls@parse@date@arg` The `\pkccls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkccls@targetdate` and `\pkccls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkccls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkccls@targetlabel` will be made empty.

If the argument doesn’t start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkccls@mindate`, otherwise this macro is made empty.

So in summary we have:

Input	<code>\pkccls@targetdate</code>	<code>\pkccls@targetlabel</code>	<code>\pkccls@mindate</code>
<code>\empty</code>	<code><global-rollbackdate-as-number></code>	<code>\empty</code>	<code>\empty</code>
<code>\date</code>	<code><global-rollbackdate-as-number></code>	<code>\empty</code>	<code>\date</code>
<code>=\date</code>	<code><date-as-number></code>	<code>\empty</code>	<code>\empty</code>
<code>=\version</code>	1	<code>\version</code>	<code>\empty</code>
<code>\other</code>	<code><global-rollbackdate-as-number></code>	<code>\empty</code>	<code>\other</code>

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn’t one 0.

```
1630 \def\pkccls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```

1631 \ifx\@nil#1\@nil
1632   \pkccls@targetdate\requestedLaTeXdate\relax
1633   \let\pkccls@targetlabel\@empty
1634   \let\pkccls@mindate\@empty

```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```

1635      \else
1636          \pkgcls@parse@date@arg@#1=\@nil\relax
1637      \fi
1638  }
```

The actual parsing work then happens in \pkgcls@parse@date@arg@:

```
1639 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set \pkgcls@targetdate depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
1640 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with \parse@version, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```

1641 \ifx\@nil#1\@nil
1642     \parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to \pkgcls@targetdate and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change \pkgcls@targetdate and set \pkgcls@targetlabel to the version name (after stripping off the trailing =).

```

1643 \ifnum \pkgcls@targetdate=\z@
1644     \pkgcls@targetdate\@ne
1645     \def\pkgcls@innerdate{\maxdimen}%
1646     \pkgcls@parse@date@arg@version#2%
1647 \else
1648     \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
1649 \fi
1650 \let\pkgcls@mindate\@empty
1651 \else
```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of \pkgcls@targetdate):

```

1652 \requestedLaTeXdate\relax
1653 \let\pkgcls@targetlabel\@empty
1654 \def\pkgcls@innerdate{\maxdimen}%
1655 \def\pkgcls@mindate{\#1}%

```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```

1656 \ifnum \pkgcls@targetdate > \z@
1657     \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
1658         \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
1659             A minimal date of #1 has been specified for
1660             \pkgcls@ext\MessageBreak '\pkgcls@name'.\MessageBreak
1661             But this is in conflict
1662             with a rollback request to \requestedpatchdate}
1663 \fi
```

```

1664      \fi
1665      \fi
1666 }

```

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

```

1667 \def\pkgcls@parse@date@arg@version#1=%
1668   \def\pkgcls@targetlabel{#1}

```

(End of definition for \pkgcls@parse@date@arg.)

- \DeclareRelease First argument is the “name” of the release and it can be left empty if one doesn’t like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be *<pkg/cls-name>-<date>.extension* but this is not enforced and through this argument one can overwrite it.

```

1669 \def\DeclareRelease#1#2#3{%
1670   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1671   {*tracerollback}
1672     \pkgcls@debug{---\string\DeclareRelease:}%
1673     \pkgcls@debug{\@spaces 1: #1}%
1674     \pkgcls@debug{\@spaces 2: #2}%
1675     \pkgcls@debug{\@spaces 3: #3}%
1676   {*}tracerollback}

```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

1677 \ifx\@nil#2\@nil
1678   \ifnum\pkgcls@targetdate=\@ne % named request
1679     \def\reserved@a{#1}%
1680     \ifx\pkgcls@targetlabel\reserved@a
1681       \pkgcls@use@this@release{#3}{}%
1682     {*}tracerollback
1683     \else
1684       \pkgcls@debug{Label doesn't match}%
1685   {*}tracerollback
1686   \fi
1687   {*}tracerollback
1688   \else
1689     \pkgcls@debug{Date request: ignored}%
1690   {*}tracerollback
1691   \fi
1692   \else

```

If the value of \pkgcls@targetdate is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```
1693   \ifnum\pkgcls@targetdate>\@ne % a real request
```

So we parse the date of this release to check if it is before or after the request date.

```

1694   \ifnum\@parse@version#2//00\@nil
1695     >\pkgcls@targetdate

```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date when a package used didn't yet exist). So we make a complained to the user.

```

1696      \ifx\pkgcls@candidate@\empty
1697          \pkgcls@rollbackdate@error{#2}%
1698          \pkgcls@use@this@release{#3}{#2}%
1699      \else
1700          \pkgcls@use@this@release\pkgcls@candidate
1701                      \pkgcls@releasedate
1702      \fi
1703  \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

1704      \def\pkgcls@candidate{#3}%
1705      \def\pkgcls@releasedate{#2}%
1706  {*tracer rollback}
1707      \pkgcls@debug{New candidate: #3}%
1708  {/tracer rollback}
1709      \fi
1710  \else

```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

1711      \def\reserved@a{#1}%
1712      \ifx\pkgcls@targetlabel\reserved@a
1713          \pkgcls@use@this@release{#3}{#2}%
1714  {*tracer rollback}
1715      \else
1716          \pkgcls@debug{Label doesn't match}%
1717  {/tracer rollback}
1718      \fi
1719      \fi
1720      \fi
1721  \fi
1722 }

```

(End of definition for `\DeclareRelease`.)

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```
1723 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```
1724 \pkgcls@show@selection{#1}{#2}%
```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed⁵¹ and then we finally load the correct release.

⁵¹The older release may also have such declarations inside if it was a simply copy of the .sty or .cls file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `\@@input`!

```

1725   \pkgcls@targetdate\z@
1726   \caddtofilelist{\#1}%
1727   \@@input #1\relax
1728   \endinput
1729 }
```

(End of definition for `\pkgcls@use@this@release`.)

`\pkgcls@show@selection` This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```

1730 \def\pkgcls@show@selection#1#2{%
1731   (*tracer rollback)
1732   \pkgcls@debug{Result: use #1}%
1733   (/tracer rollback)
1734   \GenericInfo
1735   {\@spaces\@spaces\space}{Rollback for
1736   \@cls@pkg\space'@\currname' requested ->
1737   \ifnum\pkgcls@targetdate>\@ne
1738     date
1739     \ifnum\requestedLaTeXdate=\pkgcls@targetdate
1740       \requestedpatchdate
1741     \else
1742       \expandafter\gobble\pkgcls@arg
1743     \fi.\MessageBreak}
```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```

1744   Best approximation is
1745   \else
1746     version '\pkgcls@targetlabel'.\MessageBreak
1747     This corresponds to
1748   \fi
1749   \ifx\@nil#2\@nil
1750     a special release%
1751   \else
1752     the release introduced on #2%
1753   \fi
1754   \gobble}%
1755 }
```

(End of definition for `\pkgcls@show@selection`.)

`\pkgcls@rollbackdate@error` This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```

1756 \def\pkgcls@rollbackdate@error#1{%
1757   \@latex@error{Suspicious rollback date given}%
```

```

1758 {The \@cls@pkg\space'\@currname' has no rollback data
1759   before #1 which\MessageBreak
1760   is after your requested rollback date --- so
1761   something may be wrong here.\MessageBreak
1762   Continue and we use the earliest known release.}}

```

(End of definition for \pkgcls@rollbackdate@error.)

\DeclareCurrentRelease This declares the date (and possible name) of the current version of a package or class.

```
1763 \def\DeclareCurrentRelease#1#2{%
```

First we test if \pkgcls@targetdate is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```

1764 \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1765 <*tracer rollback>
1766   \pkgcls@debug{---DeclareCurrentRelease}%
1767   \pkgcls@debug{ 1: #1}%
1768   \pkgcls@debug{ 2: #2}%
1769 </tracer rollback>

```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```

1770 \ifnum\pkgcls@targetdate>\one % a date request
1771   \ifnum@\parse@version#2//00@nil
1772     >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a \DeclareCurrentRelease but no declared older releases (so basically the use of the declaration is a bit dubious).

```

1773   \ifx\pkgcls@candidate@\empty
1774     \pkgcls@rollbackdate@error{#2}%
1775   \else
1776     \pkgcls@use@this@release\pkgcls@candidate
1777       \pkgcls@releasedate
1778   \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

1779   \else
1780     \pkgcls@show@selection{current version}{#2}%
1781   \fi
1782 \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1783 \def\reserved@a{#1}%
1784 \ifx\pkgcls@targetlabel\reserved@a
1785   \pkgcls@show@selection{current version}{#2}%
1786 \else
1787   \@latex@error{Requested version '\pkgcls@targetlabel' for
1788     \@cls@pkg\space'\@currname' is unknown}\@ehc
1789 \fi

```

```
1790     \fi
1791     \fi
1792 }
```

(End of definition for \DeclareCurrentRelease.)

- \IfTargetDateBefore This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```
1793 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1794   \ifnum\pkgcls@innerdate <%
1795     \expandafter\@parse@version\expandafter0#1//00@nil
1796     \typeout{Exclude code introduced on #1}%
1797     \expandafter\@firstoftwo
1798   \else
1799     \typeout{Include code introduced on #1}%
1800     \expandafter\@secondoftwo
1801   \fi
1802 }
```

(End of definition for \IfTargetDateBefore.)

```
1803 (/2ekernel | latexreleasefirst)
```

6 After Preamble

Finally we declare a package that allows all the commands declared above to be \onlypreamble to be used after \begin{document}.

```
1804 <*afterpreamble>
1805 \NeedsTeXFormat{LaTeX2e}
1806 \ProvidesPackage{pkgindoc}
1807   [2020-08-08 v1.3m Package Interface in Document (DPC)]
1808 \def\reserved@a{\do\@classoptionslist\do\filec@ntents\relax}%
1809   \gdef\@preamblecmds{\#1\#3}%
1810 \expandafter\reserved@a\@preamblecmds\relax
1811 (/afterpreamble)
```

File 51

ltkeys.dtx

1 Creating and using keyval options

As with any key–value input, using key–value pairs as package or class options has two parts: creating the key options and setting (using) them. Options created in this way *may* be used after package loading as general key–value settings: this will depend on the nature of the underlying code.

```
\DeclareKeys \DeclareKeys [{family}] {declarations}
```

Creates a series of options from a comma-separated *declarations* list. Each entry in this list is a key–value pair, with the *key* having one or more *properties*. A small number of “basic” *properties* are described below. The full range of properties, provided by *l3keys*, can also be used for more powerful processing. See *interface3* for the full details.

The basic properties provided here are

- **.code** — execute arbitrary code
- **.if** — sets a *TeX* `\if...` switch
- **.ifnot** — sets an inverted *TeX* `\if...` switch
- **.pass-to-packages** — for class options, this specifies whether the option should be treated “global” (read by packages from the global list); for package options this property has no effect
- **.store** — stores a value in a macro
- **.usage** — defines whether the option can be given only when loading (*load*), in the preamble (*preamble*) or has no limitation on scope (*general*)

The part of the *key* before the *property* is the *name*, with the *value* working with the *property* to define the behaviour of the option.

For example, with

```
\DeclareKeys[mypkg]
{
    draft.if      = @mypkg@draft      ,
    draft.usage   = preamble          ,
    name.store    = \@mypkg@name      ,
    name.usage    = load              ,
    second-name.store = \@mypkg@other@name
}
```

three options would be created. The option `draft` can be given anywhere in the preamble, and will set a switch called `\if@mypkg@draft`. The option `name` can only be given during package loading, and will save whatever value it is given in `\@mypkg@name`. Finally, the option `second-name` can be given anywhere, and will save its value in `\@mypkg@other@name`.

Keys created *before* the use of `\ProcessKeyOptions` act as package options.

```
\DeclareUnknownKeyHandler \DeclareUnknownKeyHandler [<family>] {{code}}
```

The function `\DeclareUnknownKeyHandler` may be used to define the behavior when an undefined key is encountered. The `<code>` will receive the unknown key name as #1 and the value as #2. These can then be processed as appropriate, e.g. by forwarding to another package.

```
\ProcessKeyOptions \ProcessKeyOptions [<family>]
```

The `\ProcessKeyOptions` function is used to check the current option list against the keys defined for `<family>`. Global (class) options and local (package) options are checked when this function is called in a package.

```
\SetKeys \SetKeys [<family>] {{keyvals}}
```

Sets (applies) the explicit list of `<keyvals>` for the `<family>`: if the latter is not given, the value of `\@currname` used. This command may be used within a package to set options before or after using `\ProcessKeyOptions`.

1.1 Implementation of `lkeys`

```
1  (@=keys)
2  (*2ekernel)
3  \ExplSyntaxOn
```

1.2 Key properties

```
.code
.if
4  \group_begin:
.ifnot
5    \cs_set_protected:Npn \__keys_tmp:nn #1#2
.store
6    {
.usage
7      \quark_if_recursion_tail_stop:n {#1}
8      \cs_new_eq:cc
9        { \c_keys_props_root_str . #2 }
10       { \c_keys_props_root_str . #1 }
11       \__keys_tmp:nn
12     }
13   \__keys_tmp:nn
14   { code:n }           { code }
15   { legacy_if_set:n } { if }
16   { legacy_if_set_inverse:n } { ifnot }
17   { tl_set:N }         { store }
18   { usage:n }          { usage }
19   { \q_recursion_tail } { }
20   \q_recursion_stop
21 \group_end:
```

(End of definition for `.code` and others.)

`.pass-to-packages` Used to force options to be global: as this property (uniquely) has an *optional* value, there is a bit of work to do.
`__keys_scope:n`
22 `\cs_new_protected:cpn { \c_keys_props_root_str .pass-to-packages }`
23 `{`
24 `\bool_if:NTF \l__keys_no_value_bool`

```

25      { \_\_keys_scope:n { true } }
26      { \_\_keys_scope:n }
27  }
28 \cs_new_protected:Npn \_\_keys_scope:n #1
29  {
30      \str_case:nnF {#1}
31  {
32      { true }
33      { \_\_keys_scope:N \clist_put_right:NV }
34      { false }
35      { \_\_keys_scope:N \clist_remove_all:NV }
36  }
37  {
38      \msg_error:nnnn { keys }
39      { choice-unknown }
40      { .pass-to-packages }
41      {#1}
42  }
43  }
44 \cs_new_protected:Npn \_\_keys_scope:N #1
45  {
46      \exp_after:wN \_\_keys_find_key_module:wNN
47      \l_keys_path_str \s__keys_stop
48      \l_keys_key_tl \l_keys_key_str
49      #1 \l__keys_forced_global_clist \l_keys_key_str
50  }

```

(End of definition for `.pass-to-packages`, `__keys_scope:n`, and `__keys_scope:N`.)

1.3 Main mechanism

```

51 \cs_generate_variant:Nn \clist_if_in:NnT { Ne }
52 \cs_generate_variant:Nn \clist_if_in:NnTF { Ne }
53 \cs_generate_variant:Nn \clist_put_right:Nn { Nv }

```

`\l__keys_class_only_clist` Used to track class-only options.

```
54 \clist_new:N \l__keys_class_only_clist
```

(End of definition for `\l__keys_class_only_clist`.)

`\l__keys_forced_global_clist` Used to force options to be global.

```
55 \clist_new:N \l__keys_forced_global_clist
```

(End of definition for `\l__keys_forced_global_clist`.)

`\l__keys_options_clist` A single list is used for all options, into which they are collected before processing.

```
56 \clist_new:N \l__keys_options_clist
```

(End of definition for `\l__keys_options_clist`.)

`\l__keys_options_loading_bool`

Used to indicate we are in the loading phase: controls the outcome of warnings.

```
57 \bool_new:N \l__keys_options_loading_bool
```

`__keys_options:n` The main function calls functions to collect up the global and local options into `\l__keys_options_clist` before calling the underlying functions to actually do the processing. So that a suitable message is produced if the option is unknown, the special `unknown` key is set if it does not already exist for the current family, and is cleaned up afterwards if required. To allow the L^AT_EX 2 _{ε} layer to know this mechanism is active, and to deal with the key family not matching the file name, we store the family in all cases. Global options are only considered the first time a package is loaded: this is tracked using `opt@handler@currname.\@currext`, as this is defined once keyval processing has been applied for the first time.

```

58 \cs_new_protected:Npn \__keys_options:n #1
59   { \__keys_options_expand_module:Nn \__keys_options_aux:n {#1} }

97 }
```

(End of definition for `__keys_options:n`, `__keys_options_aux:n`, and `__keys_options_end:..`)

__keys_options_global:n Global (class) options are handled differently for L^AT_EX 2 _{ε} packages and classes. Hence this function is essentially a check on the current file type. The initial test is needed as L^AT_EX 2 _{ε} allows variables to be equal to \scan_stop:, which is usually forbidden in expl3 code.

```

98 \cs_new_protected:Npn \_\_keys_options_global:n #1
99  {
100   \cs_if_eq:NNF \@raw@classoptionslist \scan_stop:
101   {
102     \cs_if_eq:NNTF \@currext \@csextension
103     { \_\_keys_options_class:n {#1} }
104     { \_\_keys_options_package:n {#1} }
105   }
106 }

```

(End of definition for __keys_options_global:n.)

__keys_options_class:n For classes, each option (stripped of any content after =) is checked for existence as a key. If found, the option is added to the combined list for processing. On the other hand, unused options are stored up in \@unusedoptionlist. An earlier version of this code checked for the unknown key just once and if found short-cutted the loop: that though makes handling more complex situations harder, so we take the performance hit instead. Options used by classes are tracked but the catch-all unknown is excluded (hence not using a lazy evaluation for the key testing).

```

107 \cs_new_protected:Npn \_\_keys_options_class:n #1
108  {
109    \cs_if_free:cF { \@raw@opt@ \@currname . \@currext }

124      \clist_put_right:Ne \l_\_keys_class_only_clist { \tl_to_str:n {#1} }
125    }
126    {
127      \keys_if_exist:nnTF {#3} { unknown }
128      { \_\_keys_options_class:nn {#1} {#2} }
129      {
130        \clist_if_in:NnF \@unusedoptionlist {#1}
131        { \clist_put_right:Nn \@unusedoptionlist {#1} }
132      }
133    }
134  }
135 \cs_new_protected:Npn \_\_keys_options_class:nn #1#2
136  {

```

```

137      \clist_remove_all:Nn \@unusedoptionlist {#1}
138      \clist_put_right:Nn \l__keys_options_clist {#2}
139    }
(End of definition for \__keys_options_class:n, \__keys_options_class:nn, and
\__keys_options_class:nn.)
```

__keys_options_package:n
__keys_options_package:nnn
__keys_options_package:nn

For global options when processing a package, the tasks are slightly different from those for a class. The check is the same, but here there is nothing to do if the option is not applicable. Each valid option also needs to be removed from \@unusedoptionlist.

```

140 \cs_new_protected:Npn \__keys_options_package:n #1
141   {
142     \clist_map_inline:Nn \@raw@classoptionslist
143     {
144       \exp_args:Ne \__keys_options_package:nnn
145       { \tl_trim_spaces:e { \__keys_remove_equals:n {##1} } }
146       {##1} {#1}
147     }
148   }
```

The forced-global test here needs to use \tl_to_str:n as the data come from a key name, which is always a string.

```

149 \cs_new_protected:Npn \__keys_options_package:nnn #1#2#3
150   {
151     \keys_if_exist:nnT {#3} {#1}
152     {
153       \clist_if_in:NeTF \l__keys_class_only_clist { \tl_to_str:n {#1} }
154       {
155         \clist_if_in:NeT \l__keys_forced_global_clist { \tl_to_str:n {#1} }
156         { \__keys_options_package:nn {#1} {#2} }
157       }
158       { \__keys_options_package:nn {#1} {#2} }
159     }
160   }
161 \cs_new_protected:Npn \__keys_options_package:nn #1#2
162   {
163     \clist_put_right:Nn \l__keys_options_clist {#2}
164     \clist_remove_all:Nn \@unusedoptionlist {#1}
165   }
```

(End of definition for __keys_options_package:n, __keys_options_package:nnn, and
__keys_options_package:nn.)

__keys_options_local: If local options are found, they are added to the processing list. L^AT_EX 2 _{ε} stores options for each file in a macro which may or may not exist, hence the need to use \cs_if_exist:c.

```

166 \cs_new_protected:Npn \__keys_options_local:
167   {
168     \cs_if_eq:NNF \@currext \@clsextension
169     {
170       \cs_if_exist:cT { \raw@opt@ \@currname . \@currext }
171       {
172         \clist_put_right:Nv \l__keys_options_clist
173         { \raw@opt@ \@currname . \@currext }
174       }
175     }
176   }
```

(End of definition for `_keys_options_local`.)

`_keys_remove_equals:n` As the name suggests, this is a simple function to remove an equals sign from the input.
`_keys_remove_equals:w` This is all wrapped up in an `n` function so that there will always be a sign available.

```
177 \cs_new:Npn \_keys_remove_equals:n #1
178   { \_keys_remove_equals:w #1 = \s__keys_stop }
179 \cs_new:Npn \_keys_remove_equals:w #1 = #2 \s__keys_stop { \exp_not:n {#1} }
```

(End of definition for `_keys_remove_equals:n` and `_keys_remove_equals:w`.)

1.4 The document interfaces

```
180 \cs_generate_variant:Nn \keys_define:nn { nx }
```

`_keys_options_expand_module:Nn` To deal with active characters inside the module argument whilst also expanding that argument, we use a combination of c- and f-type expansion. This works as the definitions for active UTF-8 bytes contain an `\ifincharname` test.

```
181 \cs_new_protected:Npn \_keys_options_expand_module:Nn #1#2
182   {
183     \cs:w \_keys_options_expand_module:nN \use:e { \cs_end: {#2} } #1
184   }
185 \cs_new_protected:Npn \_keys_options_expand_module:nN #1#2
186   { #2 {#1} }
```

(End of definition for `_keys_options_expand_module:Nn` and `_keys_options_expand_module:nN`.)

`\DeclareKeys`

Defining key options is quite straight-forward: we have an intermediate function to allow for potential set-up steps.

```
187 \NewDocumentCommand \DeclareKeys { O { \currname } +m }
188   { \_keys_options_expand_module:Nn \keys_define:nn {#1} {#2} }
```

(End of definition for `\DeclareKeys`. This function is documented on page 1091.)

`\DeclareUnknownKeyHandler`

```
189 \NewDocumentCommand \DeclareUnknownKeyHandler { O { \currname } +m }
190   {
191     \cs_set_protected:cpn { \_keys_unknown_handler_ #1 :nn } ##1##2 {#2}
192     \_keys_options_expand_module:Nn \keys_define:nx {#1}
193     {
194       unknown .code:n =
195         \exp_not:N \exp_args:NV
196         \exp_not:c { \_keys_unknown_handler_ #1 :nn }
197         \exp_not:N \l_keys_key_str {####1}
198     }
199   }
```

(End of definition for `\DeclareUnknownKeyHandler`. This function is documented on page 1092.)

`\ProcessKeyOptions`

We need to deal with the older interface from l3keys2e here: it had a mandatory argument. We can mop that up using a look-ahead, and then exploit that information to determine whether the package option handling is set up for the new approach for clash handling.

```
200 \NewDocumentCommand \ProcessKeyOptions { O { \currname } }
201   { \_keys_options:n {#1} }
202 \onlypreamble \ProcessKeyOptions
```

(End of definition for `\ProcessKeyOptions`. This function is documented on page 1092.)

1.5 Option usage scope

`_keys_options_loaded:n` Indicates that the load-time options for a package have been processed: once this has happened, make them unavailable either with a warning or an error.

```

203 \cs_new_protected:Npn \_keys_options_loaded:n #1
204 {
205     \prop_get:NnNT \l_keys_usage_load_prop {#1} \l_keys_tmpa_tl
206     {
207         \clist_map_inline:Nn \l_keys_tmpa_tl
208         {
209             \keys_define:nn {#1}
210             {
211                 ##1 .code:n =
212                     \_keys_options_loaded:nn {#1} {##1}
213             }
214         }
215     }
216 }
217 \cs_new_protected:Npn \_keys_options_loaded:nn #1#2
218 {
219     \bool_if:NTF \l_keys_options_loading_bool
220     { \msg_warning:nnnn { keys } { load-option-ignored } }
221     { \msg_error:nnnn { keys } { load-only } }
222     {#1} {#2}
223 }

224 \msg_new:nnn { keys } { load-option-ignored }
225 {
226     Package~"\msg_module_name:n {#1}"~has~already~been~loaded:~
227     ignoring~load-time~option~"#2".
228 }

229 \msg_new:nnnn { keys } { load-only }
230 {
231     Key~"#2"~may~only~be~used~during~loading~of~package~
232     "\msg_module_name:n {#1}".
233 }
234 {

236     in~the~optional~argument~when~loading~package~"\msg_module_name:n{#1}".
237 }
```

(End of definition for `_keys_options_loaded:n` and `_keys_options_loaded:nn`.)

Disable all preamble options in one shot.

```

238 \tl_gput_left:Nn \c_kernel@after\begindocument
239 {
240     \prop_map_inline:Nn \l_keys_usage_preamble_prop
241     {
242         \clist_map_inline:nn {#2}
243         {
244             \keys_define:nn {#1}
245             {
246                 ##1 .code:n =
247                     \msg_error:nnn { keys } { preamble-only } {##1}
248             }
249     }
```

```

249         }
250     }
251   }
252 \msg_new:nnnn { keys } { preamble-only }
253   { Key~"#1"~may~only~be~used~in~the~preamble. }
254   {
255     LaTeX~was~asked~to~set~a~key~called~"#1",~but~this~is~only~allowed~
256     before~\begin{document}.~You~will~need~to~set~the~key~earlier.
257   }

```

1.6 General key setting

\SetKeys A simple wrapper.

```

258 \NewDocumentCommand \SetKeys { O { \currname } +m }
259   { \keys_options_expand_module:Nn \keys_set:nn {#1} {#2} }

```

(End of definition for **\SetKeys**. This function is documented on page 1092.)

```

260 \ExplSyntaxOff
261 
```

File 52

ltfilehook.dtx

1 Introduction

1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed). Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all “include files” or all “packages”, and there are also hooks that are specific to a single file, e.g., do something after the package `foo.sty` has been loaded.

1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as `\input`, `\include`, `\usepackage`, etc. They are not called for files read using internal low-level methods, such as `\Cinput` or `\openin`.

`file/before`
`file/.../before`
`file/.../after`
`file/after`

These are:

`file/before`, `file/<file-name>/before` These hooks are executed in that order just before the file is loaded for reading. The code of the first hook is used with every file, while the second is executed only for the file with matching `<file-name>` allowing you to specify code that only applies to one file.

`file/<file-name>/after`, `file/after` These hooks are after the file with name `<file-name>` has been fully consumed. The order is swapped (the specific one comes first) so that the `/before` and `/after` hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both `/before` and `/after` hooks.

So the overall sequence of hook processing for any file read through the user interface commands of L^AT_EX is:

```
\UseHook{file/before}
\UseHook{file/<file name>/before}
  <file contents>
\UseHook{file/<file name>/after}
\UseHook{file/after}
```

The file hooks only refer to the file by its name and extension, so the `<file name>` should be the file name as it is on the filesystem with extension (if any) and without paths. Different from `\input` and similar commands, the `.tex` extension is not assumed in hook `<file name>`, so `.tex` files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that \TeX prioritizes `.tex` files, so if two files `foo` and `foo.tex` exist in the search path, only the latter will be seen.

When a file is input, the $\langle \text{file name} \rangle$ is available in `\CurrentFile`, which is then used when accessing the `file/⟨file name⟩/before` and `file/⟨file name⟩/after`.

`\CurrentFile` The name of the file about to be read (or just finished) is available to the hooks through `\CurrentFile` (there is no `expl3` name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, `\input{sample}` and `\input{app/sample.tex}` would both have `\CurrentFile` being `sample.tex`.

`\CurrentFilePath` The path to the current file (complement to `\CurrentFile`) is available in `\CurrentFilePath` if needed. The paths returned in `\CurrentFilePath` are only user paths, given through `\input@path` (or `expl3`'s equivalent `\l_file_search_path_seq`) or by directly typing in the path in the `\input` command or equivalent. Files located by `kpsewhich` get the path added internally by the \TeX implementation, so at the macro level it looks as if the file were in the current folder, so the path in `\CurrentFilePath` is empty in these cases (package and class files, mostly).

`\CurrentFileUsed` **`\CurrentFilePathUsed`** In normal circumstances these are identical to `\CurrentFile` and `\CurrentFilePath`. They will differ when a file substitution has occurred for `\CurrentFile`. In that case, `\CurrentFileUsed` and `\CurrentFilePathUsed` will hold the actual file name and path loaded by \LaTeX , while `\CurrentFile` and `\CurrentFilePath` will hold the names that were *asked for*. Unless doing very specific work on the file being read, `\CurrentFile` and `\CurrentFilePath` should be enough.

1.3 Hooks for package and class files

Commands to load package and class files (e.g., `\usepackage`, `\RequirePackage`, `\LoadPackageWithOptions`, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., `file/array.sty/after` would be called after the `array` package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

`package/before` These are:
`package/after`
`package/.../before` **`package/before, package/after`** These hooks are called for each package being loaded.
`package/.../after`
`class/before` **`package/⟨name⟩/before, package/⟨name⟩/after`** These hooks are additionally called if the package name is $\langle \text{name} \rangle$ (without extension).
`class/after`
`class/.../before` **`class/before, class/after`** These hooks are called for each class being loaded.
`class/.../after` **`class/⟨name⟩/before, class/⟨name⟩/after`** These hooks are additionally called if the class name is $\langle \text{name} \rangle$ (without extension).

All `/after` hooks are implemented as reversed hooks.

The overall sequence of execution for `\usepackage` and friends is:

```
\UseHook{package/before}
\UseOneTimeHook{package/⟨package name⟩/before}
  \UseHook{file/before}
  \UseHook{file/⟨package name⟩.sty/before}
    ⟨package contents⟩
  \UseHook{file/⟨package name⟩.sty/after}
  \UseHook{file/after}
  code from \AtEndOfPackage if used inside the package
\UseOneTimeHook{package/⟨package name⟩/after}
\UseHook{package/after}
```

and similar for class file loading, except that `package/` is replaced by `class/` and `\AtEndOfPackage` by `\AtEndOfClass`.

If a package or class is not loaded none of the hooks are executed!

All class or package hooks involving the name of the class or package are implemented as one-time hooks, whereas all other such hooks are normal hooks. This allows for the following use case

```
\AddToHook{package/varioref/after}
{ ... apply my customizations if the package gets
  loaded (or was loaded already) ... }
```

without the need to first test if the package is already loaded.

1.4 Hooks for `\include` files

To manage `\include` files, L^AT_EX issues a `\clearpage` before and after loading such a file. Depending on the use case one may want to execute code before or after these `\clearpages` especially for the one that is issued at the end.

Executing code before the final `\clearpage`, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places.⁵² None of the hooks are executed when an `\include` file is bypassed because of an `\includeonly` declaration. They are, however, all executed if L^AT_EX makes an attempt to load the `\include` file (even if it doesn't exist and all that happens is "No file `⟨filename⟩.tex`").

⁵²If you want to execute code before the first `\clearpage` there is no need to use a hook—you can write it directly in front of the `\include`.

`include/before`
`include/.../before`
`include/end`
`include/.../end`
`include/after`
`include/.../after`

These are:

`include/before, include/<name>/before` These hooks are executed (in that order) after the initial `\clearpage` and after `.aux` file is changed to use `<name>.aux`, but before the `<name>.tex` file is loaded. In other words they are executed at the very beginning of the first page of the `\include` file.

`include/<name>/end, include/end` These hooks are executed (in that order) after L^AT_EX has stopped reading from the `\include` file, but before it has issued a `\clearpage` to output any deferred floats.

`include/<name>/after, include/after` These hooks are executed (in that order) after L^AT_EX has issued the `\clearpage` but before it has switched back writing to the main `.aux` file. Thus technically we are still inside the `\include` and if the hooks generate any further typeset material including anything that writes to the `.aux` file, then it would be considered part of the included material and bypassed if it is not loaded because of some `\includeonly` statement.⁵³

`include/excluded, include/<name>/excluded` The above hooks for `\include` files are only executed when the file is loaded (or more exactly the load is attempted). If, however, the `\include` file is explicitly excluded (through an `\includeonly` statement) the above hooks are bypassed and instead the `include/excluded` hook followed by the `include/<name>/excluded` hook are executed. This happens after L^AT_EX has loaded the `.aux` file for this include file, i.e., after L^AT_EX has updated its counters to pretend that the file was seen.

All `include` hooks involving the name of the included file are implemented as one-time hooks (whereas all other such hooks are normal hooks).

If you want to execute code that is run for every `\include` regardless of whether or not it is excluded, use the `cmd/include/before` or `cmd/include/after` hooks.

1.5 High-level interfaces for L^AT_EX

We do not provide any additional wrappers around the hooks (like `filehook` or `scrlfile`) because we believe that for package writers the high-level commands from the hook management, e.g., `\AddToHook`, etc. are sufficient and in fact easier to work with, given that the hooks have consistent naming conventions.

⁵³For that reason another `\clearpage` is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

1.6 Kernel, class, and package interfaces for L^AT_EX

```
\declare@file@substitution \declare@file@substitution {<file>} {<replacement-file>}
\undeclare@file@substitution \undeclare@file@substitution {<file>}
```

If `<file>` is requested for loading replace it with `<replacement-file>`. `\CurrentFile` remains pointing to `<file>` but `\CurrentFileUsed` will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of L^AT_EX kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases. As such it is mainly meant for use in the L^AT_EX kernel but other use cases are conceivable.

The `\undeclare@file@substitution` declaration undoes a substitution made earlier.

Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementing the same functionality as the original one!

```
\disable@package@load \disable@package@load {<package>} {<alternate-code>}
\reenable@package@load \reenable@package@load {<package>}
```

If `<package>` is requested, do not load it but instead run `<alternate-code>` which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files and again it should only be applied if there are good reasons for doing this.⁵⁴

1.7 A sample package for structuring the log output

As an application we provide the package `structuredlog` that adds lines to the `.log` when a file is opened and closed for reading keeping track of nesting level as well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
```

⁵⁴Just to be sure: "I don't like this package by somebody else" is not a good one :-)

```

= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.hd
= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) ot1lmr.fd
== (LEVEL 2 STOP) ot1lmr.fd
== (LEVEL 2 START) omllmm.fd
== (LEVEL 2 STOP) omllmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxlmex.fd
== (LEVEL 2 STOP) omxlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) ts1lmr.fd
== (LEVEL 2 STOP) ts1lmr.fd
== (LEVEL 2 START) t1lmss.fd
== (LEVEL 2 STOP) t1lmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx

```

Thus if you inspect an issue in the .log it is easy to figure out in which file it occurred, simply by searching back for LEVEL and if it is a STOP then remove 1 from the level value and search further for LEVEL with that value which should then be the START level of the file you are in.

2 The Implementation

```

1 <*2ekernel>
2 <@=filehook>

```

2.1 Document and package-level commands

\CurrentFile
\CurrentFilePath
\CurrentFileUsed
\CurrentFilePathUsed

User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested \input). The versions ...Used hold the *actual* file name and path that is loaded by L^AT_EX, whereas the other two hold the name as requested. They will differ in case there's a file substitution.

```

29 \ExplSyntaxOn

```

A utility macro to trigger `expl3`'s file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn't exist, no normalization takes place. The output of `__filehook_file_parse_full_name:nN` is passed on to the #2—a 3-argument macro that takes the `<path>`, `<base>`, and `<ext>` parts of the file name.

```

30 \cs_new:Npn \_\_filehook_file_parse_full_name:nN #1
31 {
32     \exp_args:Nf \file_parse_full_name_apply:nN
33     {
34         \exp_args:Nf \_\_filehook_full_name:nn
35         { \file_full_name:n {#1} } {#1}
36     }
37 }
38 \cs_new:Npn \_\_filehook_full_name:nn #1 #2
39 {
40     \tl_if_empty:nTF {#1}
41     { \tl_trim_spaces:n {#2} }
42     { \tl_trim_spaces:n {#1} }
43 }

```

(End of definition for `__filehook_file_parse_full_name:nN` and `__filehook_full_name:nn`.)

`__filehook_if_no_extension:nTF`
`__filehook_drop_extension:N`

Some actions depend on whether the file extension was explicitly given, and sometimes the extension has to be removed. The macros below use `__filehook_file_parse_full_name:nN` to split up the file name and either check if `<ext>` (#3) is empty, or discard it.

```

44 \cs_new:Npn \_\_filehook_if_no_extension:nTF #1
45 {
46     \exp_args:Ne \tl_if_empty:nTF
47     { \file_parse_full_name_apply:nN {#1} \use_iii:nnn }

\g__filehook_input_file_seq
\l__filehook_internal_tl
  \__filehook_file_push:
  \__filehook_file_pop:
  \__filehook_file_pop_assign:nnn
```

Yet another stack, to keep track of `\CurrentFile` and `\CurrentFilePath` with nested `\inputs`. At the beginning of `\InputIfFileExists`, the current value of `\CurrentFilePath` and `\CurrentFile` is pushed to `\g__filehook_input_file_seq`, and at the end, it is popped and the value reassigned. Some other places don't use `\InputIfFileExists` directly (`\include`) or need `\CurrentFile` earlier (`\@onefilewithoptions`), so these are manually used elsewhere as well.

```

2.3 Declaring the file-related hooks

These hooks have names with three-parts that start with `file/`, `include/`, `class/` or `package/` and end with `/before` or `/after` (or `/end` in the case of `include/`). They are all generic hooks so will be declared only if code is added to them; this declaration is done for you automatically and, indeed, they should not be declared explicitly.

Those named `.../after` and `include/.../end` are, when code is added, declared as reversed hooks.

2.4 Patching L^AT_EX's \InputIfFileExists command

Most of what we have to do is adding `\UseHook` into several L^AT_EX 2_E core commands, because of some circular dependencies in the kernel we do this only now and not in `ltfiles`.

```
\InputIfFileExists  \InputIfFileExists loads any file if it is available so we have to add the hooks
@input@file@exists@with@hooks   file/before and file/after in the right places. If the file doesn't exist no hooks
\unqu@tefilef@und   should be executed.
```

```
143  </2ekernel>
144  <latexrelease>\IncludeInRelease{2020/10/01}%
145  <latexrelease>          {\InputIfFileExists}{Hook management (files)}%
146  <*2ekernel | latexrelease>

147  \let\InputIfFileExists@\undefined
148  \DeclareRobustCommand \InputIfFileExists[2]{%
149    \IfFileExists{#1}%
150    {%
151      \@expl@@@filehook@file@push@@
152      \@filehook@set@CurrentFile
```

We pre-expand `\@filef@und` so that in case another file is loaded in the true branch of `\InputIfFileExists`, these don't change their value meanwhile. This isn't a worry with `\CurrentFile...` because they are kept in a stack.

```
153    \expandafter\@swaptwoargs\expandafter
154      {\expandafter\@input@file@exists@with@hooks
155       \expandafter{\@filef@und}}%
156      {#2}%
157      \@expl@@@filehook@file@pop@@
158    }%
159  }
160 \def\@input@file@exists@with@hooks#1{%
```

If the file exists then `\CurrentFile` holds its name. But we can't rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restore it for the `file/.../after` hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for `\CurrentFile` which usually is the same as `\CurrentFileUsed`. In the case of a file replacement, the `\CurrentFileUsed` holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

`\expl3`'s `\file_full_name:n` normalizes the file name (to factor out differences in the `.tex` extension), and then does a file lookup to take into account a possible path from `\l_file_search_path_seq` and `\input@path`. However only the file name and extension

are returned so that file hooks can refer to the file by their name only. The path to the file is returned in `\CurrentFilePath`.

```

161 \edef\reserved@a{%
162   \@expl@@@filehook@file@pop@assign@nnnn
163   {\CurrentFilePathUsed}%
164   {\CurrentFileUsed}%
165   {\CurrentFilePath}%
166   {\CurrentFile}}%
167 \expandafter\swaptwoargs\expandafter{\reserved@a}%

```

Before adding to the file list we need to make all (letter) characters catcode 11, because several packages use constructions like

```

\filename@parse{<filename>}
\ifx\filename@ext\clsextension
  ...
\fi

```

and that doesn't work if `\filename@ext` is `\detokenized`. Making `\clsextension` a string doesn't help much because some packages define their own `\<prefix>@someextension` with normal catcodes. This is not entirely correct because packages loaded (somehow) with catcode 12 alphabetic tokens (say, as the result of a `\string` or `\detokenize` command, or from a `\TeX` string like `\jobname`) will have these character tokens incorrectly turned into letter tokens. This however is rare, so we'll go for the all-letters approach (grepping the packages in `\TeX` Live didn't bring up any obvious candidate for breaking with this catcode change).

```

168 {\edef\reserved@a{\unqu@tefilef@und#1\@nil}%
169   \@addtofilelist{\string\makeletter\reserved@a}%
170   \UseHook{file/before}}%

```

The current file name is available in `\CurrentFile` so we use that in the specific hook.

```

171   \UseHook{file/\CurrentFile/before}%
172   \@@input #1% <- trailing space comes from \@filef@und
173 }%

```

And here, `\CurrentFile` is restored (by `\@expl@@@filehook@file@pop@assign@nnnn`) so we can use it once more.

```

174   \UseHook{file/\CurrentFile/after}%
175   \UseHook{file/after}%
176 \def\unqu@tefilef@und"#1" \@nil{#1}

```

265 ⟨@C=⟩

2.6 Selecting a file (`\set@curr@file`)

`\set@curr@file` Now we hook into `\set@curr@file` to resolve a possible file substitution, and add `\@expl@@@filehook@set@curr@file@onNN` at the end, after `\@curr@file` is set.

`\@curr@file` A file name is built using `\expandafter\string\csname<filename>\endcsname` to avoid expanding utf8 active characters. The `\csname` expands the normalization machinery and the routine to resolve a file substitution, returning a control sequence with the same name as the file.

It happens that when `<filename>` is empty, the generated control sequence is `\csname\endcsname`, and doing `\string` on that results in the file `csnameendcsname.tex`. To guard against that we `\ifx`-compare the generated control sequence with the empty `csname`. To do so, `\csname\endcsname` has to be defined, otherwise it would be equal to `\relax` and we would have false positives. Here we define `\csname\endcsname` to expand to itself to avoid it matching the definition of some other control sequence.

```

266  ⟨/2ekernel⟩
267  ⟨*2ekernel | latexrelease⟩
268  ⟨latexrelease⟩\IncludeInRelease{2022/06/01}%
269  ⟨latexrelease⟩          {\set@curr@file}{Setting current file name}%

282    \edef~{\string~}%
283    \expandafter\def\csname\expandafter\endcsname
284    \expandafter{\csname\endcsname}%

```

Two file names are set here: `\@curr@file@reqd` which is the file requested by the user, and `\@curr@file` which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. `\@curr@file` is resolved first, to check if a substitution happens. If it doesn't, `\@expl@@@filehook@if@file@replaced@CTF` short-cuts and just copies `\@curr@file`, otherwise the full normalization procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default `.tex` is *not* added to `\@curr@file` because for applications other than `\input` (graphics, for example) the default extension may not be `.tex`. First check if the input has an extension, then if the input had no extension, call

\@expl@@@filehook@drop@extension@N. In case of a file substitution, \@curr@file will have an extension.

```

This auxiliary compares `\<filename>` with `\csname\endcsname` to check if the empty `.tex` file was requested.

```

370 \long\def\@set@curr@file@aux#1{%
371   \expandafter\ifx\csname\endcsname#1%
372     .tex\else\string#1\fi}

```

Then we call `\expl@@@filehook@set@curr@file@nn` once for `\curr@file` to set `\CurrentFile(Path)Used` and once for `\curr@file@reqd` to set `\CurrentFile(Path)`. Here too the slower route is only used if a substitution happened, but here `\expl@@@filehook@if@file@replaced@tf` can't be used because the flag is reset at the `\endgroup` above, so we check if `\curr@file` and `\curr@file@reqd` differ. This macro is issued separate from `\set@curr@file` because it changes `\CurrentFile`, and side-effects would quickly get out of control.

```

373 \def\@filehook@set@CurrentFile{%

(End of definition for \@filehook@set@CurrentFile , \@kernel@make@file@csname , and
 \@set@curr@file@aux.)
```

386 ⟨@=filehook⟩

When inputting a file, `\set@curr@file` does a file lookup (in `\input@path` and `\l_file_search_path_seq`) and returns the actual file name (`(base)` plus `(ext)`) in `\CurrentFileUsed`, and in case there's a file substitution, the requested file in `\CurrentFile` (otherwise both are the same). Only the base and extension are returned, regardless of the input (both `path/to/file.tex` and `file.tex` end up as `file.tex` in `\CurrentFile`). The path is returned in `\CurrentFilePath`, in case it's needed.

```

2.7 Replacing a file and detecting loops

Start by sanitizing the file with `__filehook_file_parse_full_name:nN` then do `__filehook_file_subst_begin:nnn{⟨path⟩}{⟨name⟩}{⟨ext⟩}`.

```

406 ⟨/2ekernel⟩
407 ⟨*2ekernel | latexrelease⟩
408 ⟨latexrelease⟩\IncludeInRelease{2020/10/01}%
```

```

409 〈latexrelease〉      {\_\_filehook_resolve_file_subst:w}{Replace files detect loops}%
410  \ExplSyntaxOn
411  \cs_new:Npn \_\_filehook_resolve_file_subst:w #1 `nil
412    { \_\_filehook_file_parse_full_name:nN {#1} \_\_filehook_file_subst_begin:nnn }
413  \cs_new:Npn \_\_filehook_normalize_file_name:w #1 `nil
414    { \_\_filehook_file_parse_full_name:nN {#1} \_\_filehook_file_name_compose:nnn }
415  \cs_new:Npn \_\_filehook_file_name_compose:nnn #1 #2 #3
416    { \tl_if_empty:nF {#1} { #1 / } #2#3 }

```

Since the file replacement is done expandably in a `\csname`, use a flag to remember if a substitution happened. We use this in `\set@curr@file` to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimizing). The flag raised during the file substitution algorithm must be explicitly cleared after the `__filehook_if_file_replaced:TF` conditional is no longer needed, otherwise further uses of `__filehook_if_file_replaced:TF` will wrongly return true.

```

417 \flag_new:n { __filehook_file_replaced }
418 \cs_new:Npn \_\_filehook_if_file_replaced:TF #1 #2
419   { \flag_if_raised:nTF { __filehook_file_replaced } {#1} {#2} }
420 \cs_new_protected:Npn \_\_filehook_clear_replacement_flag:
421   { \flag_clear:n { __filehook_file_replaced } }

```

First off, start by checking if the current file (`(⟨name⟩+⟨ext⟩)`) has a declared substitution. If not, then just put that as the name (including a possible `(path)` in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary `__filehook_file_subst_tortoise_hare:nn` sees that there's no replacement for #2#3 and does nothing else.

```

422 \cs_new:Npn \_\_filehook_file_subst_begin:nnn #1 #2 #3
423  {
424    \_\_filehook_file_subst_tortoise_hare:nn {#2#3} {#2#3}
425    { \_\_filehook_file_name_compose:nnn {#1} {#2} {#3} }
426  }
427 \ExplSyntaxOff
428 〈/2ekernel | latexrelease〉
429 〈latexrelease〉\EndIncludeInRelease
430 〈*2ekernel〉

```

2.7.1 The Tortoise and Hare algorithm

If there is a substitution (`(⟨true⟩` in the first `\cs_if_exist:cTF` below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the `\flag __filehook_file_replaced` is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put `TeX` in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below, `__filehook_file_subst_loop:cc` is called with `\@file-subst@⟨file⟩` and

\@file-subst@\@file-subst@⟨file⟩; that is, the substitution of ⟨file⟩ and the substitution of that substitution: the Tortoise walks one step while the Hare walks two.

Within __filehook_file_subst_loop:NN the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's no loop, __filehook_file_subst_tortoise_hare:nn is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the \cs_if_exist:cTF below will go ⟨false⟩ and the algorithm will end; otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

431  </2ekernel>
432  <*2ekernel | latexrelease>
433  <latexrelease>\IncludeInRelease{2020/10/01}%
434  <latexrelease> {\_\_filehook_file_subst_tortoise_hare:nn}{Tortoise and Hare}%
435  \ExplSyntaxOn
436  \cs_new:Npn \_\_filehook_file_subst_tortoise_hare:nn #1 #2 #3
437  {
438      \cs_if_exist:cTF { @file-subst@ #2 }
439      {
440          \flag_if_raised:nF { __filehook_file_replaced }
441          { \flag_raise:n { __filehook_file_replaced } }
442          \cs_if_exist:cTF { @file-subst@ \use:c { @file-subst@ #2 } }
443          {
444              \_\_filehook_file_subst_loop:cc
445              { @file-subst@ #1 }
446              { @file-subst@ \use:c { @file-subst@ #2 } }
447          }
448          { \use:c { @file-subst@ #2 } }
449      }
450      { #3 }
451  }

```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the .tex file is used as fallback and __filehook_file_subst_cycle_error:cN is called to report the error.

```

452  \cs_new:Npn \_\_filehook_file_subst_loop:NN #1 #2
453  {
454      \token_if_eq_meaning:NNTF #1 #2
455      {
456          .tex
457          \_\_filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #1
458      }
459      { \_\_filehook_file_subst_tortoise_hare:nn {#1} {#2} {#2} }
460  }
461  \cs_generate_variant:Nn \_\_filehook_file_subst_loop:NN { cc }

```

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```

462  \cs_new:Npn \_\_filehook_file_subst_cycle_error:NN #1 #2
463  {
464      \msg_expandable_error:nnff { latex2e } { file-cycle }

```

```

465      {#1} { \use:c { @file-subst@ #1 } }
466      \token_if_eq_meaning:NNF #1 #2
467      { \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #2 }
468    }
469 \cs_generate_variant:Nn \__filehook_file_subst_cycle_error:NN { c }
      And the error message:
470 \msg_new:nnn { latex2e } { file-cycle }
471   { File~loop!~#1~replaced~by~#2... }

(End of definition for \__filehook_resolve_file_subst:w and others.)

2.8 Preventing a package from loading

We support the use case of preventing a package from loading but not any other type of files (e.g., classes).

```

\disable@package@load
\reenable@package@load
@disable@packageload@do
477 ⟨/2ekernel⟩
478 ⟨*2ekernel | latexrelease⟩
479 ⟨latexrelease⟩\IncludeInRelease{2020/10/01}%
480 ⟨latexrelease⟩          {\ disable@package@load}{Disable packages}%
481 \def\disable@package@load#1#2{%
482   \global\@namedef{@pkg-disable@#1.\@pkext}{#2}}

```

Here we check if a control sequence named `\@pkg-disable@⟨name⟩.sty` is defined, and if so don't use the package loading code #2, but use the replacement code stored in that control sequence, write something to the log, and then prevent `\onefilewithoptions` from sanity-checking the requested package date (the `\expandafter` here triggers one in `\onefilewithoptions` that ends a conditional there, and the `\gobbletwo` removes the date checking code from the input stream).

```

483 \def\@disable@packageload@do#1#2{%
484   \@ifundefined{@pkg-disable@#1}%
485   {#2}%
486   {\@nameuse{@pkg-disable@#1}%
487     \@latec@info{Package '#1' has been disabled.%%
488     \MessageBreak Load request ignored}%
489     \expandafter\@gobbletwo}%
      \reenable@package@load undefines \@pkg-disable@⟨package⟩ to reallow loading
      a package.
490 \def\reenable@package@load#1{%
491   \global\expandafter\let
492     \csname @pkg-disable@#1.\@pkext\endcsname \undefined}

```

```

493  </2ekernel | latexrelease>

500  <latexrelease>\let\@reenable@package@load \@undefined
501  <latexrelease>\EndIncludeInRelease
502  {*2ekernel}

(End of definition for \@disable@package@load, \@enable@package@load, and
 \@enable@package@load@do. These functions are documented on page 110.)

```

2.9 High-level interfaces for L^AT_EX

None so far and the general feeling for now is that the hooks are enough. Packages like filehook, etc., may use them to set up their interfaces (samples are given below) but for the now the kernel will not provide any.

2.10 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L^AT_EX 2 _{ε} names to allow for internal commands to be used outside this module (and in parts that still use L^AT_EX 2 _{ε} syntax). We have to unset the @@ since we want double “at” sign in place of double underscores.

```

526  \__filehook_file_pop:

```

```

527 \cs_new_eq:NN \Expl@@@filehook@file@pop@assign@nnnn
528     \__filehook_file_pop_assign:nnnn
529 \ExplSyntaxOff

```

This one specifically has to be undefined because it is left over in the input stream from `\InputIfFileExists` and executed when `latexrelease` is loaded. It cannot be `\let` to `\undefined` otherwise it would error as well, so it is `\let` to `\relax` to be silently ignored when loading `\latexrelease`.

```

530 ⟨/2ekernel | latexrelease⟩
531 ⟨latexrelease⟩\EndIncludeInRelease
532 ⟨latexrelease⟩
533 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
534 ⟨latexrelease⟩    { \Expl@@@filehook@if@no@extension@nTF}{2e tmp interfaces}%
535 ⟨latexrelease⟩\let\Expl@@@filehook@file@pop@=\relax
536 ⟨latexrelease⟩\EndIncludeInRelease
537 ⟨*2ekernel⟩

```

This ends the kernel code in this file.

```
538 ⟨/2ekernel⟩
```

3 A sample package for structuring the log output

```

539 ⟨*structuredlog⟩
540 ⟨@=filehook⟩
541 \ProvidesExplPackage
542     {structuredlog}{\ltfilehookdate}{\ltfilehookversion}
543     {Structuring the TeX transcript file}

```

`\g_filehook_nesting_level_int`

```
544 \int_new:N \g_filehook_nesting_level_int
```

Initialise the counter with the number of files in the `\currnamestack` (the number of items divided by 3) minus one, because this package is skipped when printing to the log.

```

545 \int_gset:Nn \g_filehook_nesting_level_int
546   { ( \tl_count:N \currnamestack ) / 3 - 1 }

```

(End of definition for `\g_filehook_nesting_level_int`.)

`_filehook_log_file_record:n`

This macro is responsible for increasing and decreasing the file nesting level, as well as printing to the log. The argument is either `STOPTART` or `STOP` and the action it takes on the nesting integer depends on that.

```

547 \cs_new_protected:Npn \_filehook_log_file_record:n #1
548   {
549     \str_if_eq:nnT {#1} {START} { \int_gincr:N \g_filehook_nesting_level_int }
550     \iow_term:x
551     {
552       \prg_replicate:nn { \g_filehook_nesting_level_int } { = } ~
553       ( LEVEL ~ \int_use:N \g_filehook_nesting_level_int \c_space_tl #1 ) ~
554       \CurrentFileUsed

```

If there was a file replacement, show that as well:

```
555 \str_if_eq:NNF \CurrentFileUsed \CurrentFile
556   { ~ ( \CurrentFile \c_space_tl requested ) }
557   \iow_newline:
558 }
559 \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g__filehook_nesting_level_int }
560 }
```

Now just hook the macro above in the generic `file/before...`

```
561 \AddToHook{file/before}{ \__filehook_log_file_record:n { START } }
...and file/after hooks. We don't want to install the file/after hook immediately, because that would mean it is the first time executed when the package finishes. We therefore put the declaration inside \AddToHookNext so that it gets only installed when we have left this package.
562 \AddToHookNext{file/after}
563   { \AddToHook{file/after}{ \__filehook_log_file_record:n { STOP } } }
(End of definition for \__filehook_log_file_record:n.)
564 <@>
565 
```

4 Package emulations

4.1 Package `atveryend` emulation

With the new hook management and the hooks in `\enddocument` all of `atveryend` is taken care of. We can make an emulation only here after the substitution functionality is available:

```
566 <2ekernel>
567 \declare@file@substitution{atveryend.sty}{atveryend-ltx.sty}
568 
```

Here is the package file we point to:

```
569 <atveryend-ltx>
570 \ProvidesPackage{atveryend-ltx}
571 [2020/08/19 v1.0a
572   Emulation of the original atveryend package^^Jwith kernel methods]
Here are new definitions for its interfaces now pointing to the hooks in \enddocument
573 \newcommand\AfterLastShipout { \AddToHook{\enddocument/afterlastpage} }
574 \newcommand\AtVeryEndDocument { \AddToHook{\enddocument/afteraux} }
```

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in `enddocument/info`.

```
575 \newcommand\AtEndAfterFileList{ \AddToHook{\enddocument/info} }
576 \newcommand\AtVeryVeryEnd { \AddToHook{\enddocument/end} }
```

`\BeforeClearDocument` This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```
577 \ExplSyntaxOn
578 \newcommand\BeforeClearDocument[1]
579   { \AtEndDocument{#1}
      \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
    }
```

```
582 \cs_new:Npn\atveryend@DEPRECATED #1
583   {\iow_term:x{=====DEPRECATED~USAGE~#1=====}}
584 \ExplSyntaxOff
(End of definition for \BeforeClearDocument.)
585 ⟨/atveryend-ltx⟩
```

File 53

ltshipout.dtx

1 Introduction

The code provides an interface to the `\shipout` primitive of T_EX which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.⁵⁵

1.1 Overloading the `\shipout` primitive

`\shipout` With this implementation T_EX’s shipout primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

Each shipout that actually happens (i.e., where the material is not discarded for one or the other reason) is recorded and the total number is available in a readonly variable and in a L^AT_EX counter.

`\RawShipout` This command implements a simplified shipout that bypasses the foreground and background hooks, e.g., only `shipout/firstpage` and `shipout/lastpage` are executed and the total shipout counters are incremented.

The command doesn’t use `\ShipoutBox` but its own private box register so that it can be used inside of shipout hooks to do some additional shipouts while already in the output routine with the current page being stored in `\ShipoutBox`. It does have access to `\ShipoutBox` if it is used in `shipout/before` (or `shipout/after`) and can use its content.

It is safe to use it in `shipout/before` or `shipout/after` but not necessarily in the other `shipout/...` hooks as they are intended for special processing.

⁵⁵Heiko’s interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

`\ShipoutBox`
`\l_shipout_box`

This box register is called `\ShipoutBox` (alternatively available via the L3 name `\l_`-`\shipout_box`).

This box is a “local” box and assignments to it should be done only locally. Global assignments (as done by some packages with older code where this is box is known as 255) may work but they are conceptually wrong and may result in errors under certain circumstances.

During the execution of `shipout/before` this box contains the accumulated material for the page, but not yet any material added by other shipout hooks. During execution of `shipout/after`, i.e., after the shipout has happened, the box also contains any background or foreground material.

Material from the hooks `shipout/firstpage` or `shipout/lastpage` is not included (but only used during the actual shipout) to facilitate reuse of the box data (e.g., `shipout/firstpage` material should never be added to a later page of the output).

`\l_shipout_box_ht_dim`
`\l_shipout_box_dp_dim`
`\l_shipout_box_wd_dim`
`\l_shipout_box_ht_plus_dp_dim`

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no L^AT_EX 2_E names).⁵⁶ These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

1.2 Provided hooks

`shipout/before`
`shipout/after`
`shipout/foreground`
`shipout/background`
`shipout/firstpage`
`shipout/lastpage`

The code for `\shipout` offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:

`shipout/before` This hook is executed after the finished page has been stored in `\ShipoutBox` / `\l_shipout_box`). It can be used to alter that box content or to discard it completely (see `\DiscardShipoutBox` below).

You can use `\RawShipout` inside this hook for special use cases. It can make use of `\ShipoutBox` (which doesn’t yet include the background and foreground material).

Note: It is not possible (or say advisable) to try and use this hook to typeset material with the intention to return it to main vertical list, it will go wrong and give unexpected results in many cases—for starters it will appear after the current page not before or it will vanish or the vertical spacing will be wrong!

`shipout/background` This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt. It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

⁵⁶Might need changing, but HO’s version as strings is not really helpful I think).

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

shipout/foreground This hook adds a picture environment into the foreground of the page with the $(0,0)$ coordinate in the top-left corner using a `\unitlength` of `1pt`.

Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its $(0,0)$ point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

shipout This hook is executed after foreground and/or background material has been added, i.e., just in front of the actual shipout operation. Its purpose is to allow manipulation of the finalized box (stored in `\ShipoutBox`) with the extra material also in place (which is not yet the case in `shipout/before`).

It cannot be used to cancel the shipout operation via `\DiscardShipoutBox` (that has to happen in `shipout/before`, if desired!)

shipout/firstpage The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the `.dvi` or `.pdf` output.⁵⁷

This hook is added to the very first page regardless of how it is shipped out (i.e., with `\shipout` or `\RawShipout`).

shipout/lastpage The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page of the output file — or rather on the page that `LATEX` believes is the last one. Again it is executed regardless of the shipout method.

It may not be possible for `LATEX` to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then `LATEX` will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

shipout/after This hook is executed after a shipout has happened. If the shipout box is discarded this hook is not looked at.

You can use `\RawShipout` inside this hook for special use cases and the main `\ShipoutBox` is still available at this point (but in contrast to `shipout/before` it now includes the background and foreground material).

Note: Just like `shipout/before` this hook is not meant to be used for adding typeset material back to the main vertical list—it might vanish or the vertical spacing will be wrong!

As mentioned above the hook `shipout/before` is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. It is even run if there was a `\DiscardShipoutBox` request in the document.

The other hooks (except `shipout` and `shipout/after`) are added inside hboxes to the box being shipped out in the following order:

⁵⁷In `LATEX 2ε` that was already existing, but implemented using a box register with the name `\@begindvbox`.

<code>shipout/firstpage</code>	only on the first page
<code>shipout/background</code>	
<code><boxed content of \ShipoutBox></code>	
<code>shipout/foreground</code>	
<code>shipout/lastpage</code>	only on the last page

If any of the hooks has no code then the corresponding box is added at that point.

Once the (page) box has got the above extra content it can again be manipulated using the `shipout` hook and then is shipped out for real.

Once the (page) box has been shipped out the `shipout/after` hook is called (while you are still inside the output routine). It is not called if the shipout box was discarded.

In a document that doesn't produce pages, e.g., only makes `\typeouts`, none of the hooks are ever executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

If `\RawShipout` is used instead of `\shipout` then only the hooks `shipout/firstpage` and `shipout/lastpage` are executed (on the first or last page), all others are bypassed.

1.3 Legacy L^AT_EX commands

`\AtBeginDvi` `\AtBeginDvi {<code>}`
`\AtEndDvi`

`\AtBeginDvi` is the existing L^AT_EX 2_E interface to fill the `shipout/firstpage` hook. This is not really a good name as it is not just supporting `.dvi` but also `.pdf` output or `.xdv`.

`\AtEndDvi` is the counterpart that was not available in the kernel but only through the package `atenddvi`. It fills the `shipout/lastpage` hook.

Neither interface can set a code label but uses the current default label.

As these two wrappers have been available for a long time we continue offering them (but not enhancing them, e.g., by providing support for code labels).

For new code we strongly suggest using the high-level hook management commands directly instead of “randomly-named” wrappers. This will lead to code that is easier to understand and to maintain and it also allows you to set code labels if needed.

For this reason we do not provide any other “new” wrapper commands for the above hooks in the kernel, but only keep the existing ones for backward compatibility.

1.4 Special commands for use inside the hooks

```
\DiscardShipoutBox \AddToHookNext {shipout/before} {...\DiscardShipoutBox...}
```

\shipout_discard:

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that L^AT_EX output routine is called in an asynchronous manner! Thus normally one would use this only as part of the `shipout/before` code.

Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it — not done (yet)

`\DiscardShipoutBox` cannot be used in any of the `shipout/...` hooks other than `shipout/before`.

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout`, `shipout/background` or `shipout/foreground`.⁵⁸ If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

1.5 Provided LuaT_EX callbacks

pre_shipout_filter Under LuaT_EX the `pre_shipout_filter` Lua callback is provided which gets called directly after the `shipout` hook, immediately before the shipout primitive gets invoked. The signature is

```
function(<node> head)
    return true
end
```

The `head` is the list node corresponding to the box to be shipped out. The return value should always be `true`.

⁵⁸If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

1.6 Information counters

```
\ ReadonlyShipoutCounter \ifnum\ ReadonlyShipoutCounter=...
\g_shipout_READONLY_int \int_use:N \g_shipout_READONLY_int % expl3 usage
```

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)! In contrast `shipout/after` sees the incremented value.

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that restriction, but if you manipulate it, chaos will be the result. To emphasize this fact it is not provided as a L^AT_EX counter but as a T_EX counter (i.e., a command), so `\Alph{\ReadonlyShipoutCounter}` etc, would not work.

```
totalpages \arabic{totalpages}
\g_shipout_totalpages_int \int_use:N \g_shipout_totalpage_int % expl3 usage
```

In contrast to `\ReadonlyShipoutCounter`, the `totalpages` counter is a L^AT_EX counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented. In contrast `shipout/after` sees the incremented value.

Furthermore, while it is incremented for each page, its value is never used by L^AT_EX. It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by L^AT_EX but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

```
\PreviousTotalPages \PreviousTotalPages
```

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command and not a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

1.7 Debugging shipout code

```
\DebugShipoutsOn \DebugShipoutsOn
```

`\DebugShipoutsOff`
`\shipout_debug_on:`
`\shipout_debug_off:`

Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.

Todo: This needs some rationalizing and may not stay this way.

2 Emulating commands from other packages

The packages in this section are no longer necessary, but as they are used by other packages, they are emulated when they are explicitly loaded with `\usepackage` or `\RequirePackage`.

Please note that the emulation only happens if the package is explicitly requested, i.e., the commands documented below are not automatically available in the L^AT_EX kernel! If you write a new package we suggest to use the appropriate kernel hooks directly instead of loading the emulation.

2.1 Emulating `atbegshi`

<code>\AtBeginShipoutUpperLeft</code>	<code>\AddToHook {shipout/before} {...\AtBeginShipoutUpperLeft{\code}...}</code>
<code>\AtBeginShipoutUpperLeftForeground</code>	

This adds a `picture` environment into the background of the shipout box expecting `\code` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

```
\AddToHook{shipout/background}{\code}
```

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `\code` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

<code>\AtBeginShipoutAddToBox</code>	<code>\AddToHook {shipout/before} {...\AtBeginShipoutAddToBox{\code}...}</code>
<code>\AtBeginShipoutAddToBoxForeground</code>	

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `\code` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `\code` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

`\AtBeginShipoutBox` This is the name of the shipout box as `atbegshi` knows it.

<code>\AtBeginShipoutOriginalShipout</code>

This is the name of the `\shipout` primitive as `atbegshi` knows it. This bypasses all the mechanisms set up by the L^AT_EX kernel and there are various scenarios in which it can therefore fail. It should only be used to run existing legacy `atbegshi` code but not in newly developed applications.

The kernel alternative is `\RawShipout` which is integrated with the L^AT_EX mechanisms and updates, for example, the `_READONLYSHIPOUTCOUNTER` counter. Please use `\RawShipout` for new code if you want to bypass the before, foreground and background hooks.

\AtBeginShipoutInit By default `atbegshi` delayed its action until `\begin{document}`. This command was forcing it in an earlier place. With the new concept it does nothing.

\AtBeginShipout `\AtBeginShipout{\langle code \rangle} \equiv \AddToHook{shipout/before}{\langle code \rangle}`
\AtBeginShipoutNext `\AtBeginShipoutNext{\langle code \rangle} \equiv \AddToHookNext{shipout/before}{\langle code \rangle}`

This is equivalent to filling the `shipout/before` hook by either using `\AddToHook` or `\AddToHookNext`, respectively.

\AtBeginShipoutFirst The `atbegshi` names for `\AtBeginDvi` and `\DiscardShipoutBox`.
\AtBeginShipoutDiscard

2.2 Emulating `everyshi`

The `everyshi` package is providing commands to run arbitrary code just before the shipout starts. One point of difference: in the new shipout hooks the page is available as `\ShipoutBox` for inspection of change, one should not manipulate box 255 directly inside `shipout/before`, so old code doing this would change to use `\ShipoutBox` instead of 255 or `\@cclv`.

\EveryShipout `\EveryShipout{\langle code \rangle} \equiv \AddToHook{shipout/before}{\langle code \rangle}`

\AtNextShipout `\AtNextShipout{\langle code \rangle} \equiv \AddToHookNext{shipout/before}{\langle code \rangle}`

However, most use cases for `everyshi` are attempts to put some picture or text into the background or foreground of the page and that can be done today simply by using the `shipout/background` and `shipout/foreground` hooks without any need to coding.

2.3 Emulating `atenddvi`

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box so the emulation makes the package a no-op.

2.4 Emulating `everypage`

This package patched the original `\@begindvi` hook and replaced it with its own version. Its functionality is now covered by the hooks offered by the kernel so that there is no need for such patching any longer.

\AddEverypageHook `\AddEverypageHook{\langle code \rangle} \equiv \AddToHook{shipout/background}{\put(1in,-1in){\langle code \rangle}}`

`\AddEverypageHook` is adding something into the background of every page at a position of 1in to the right and 1in down from the top left corner of the page. By using the kernel hook directly you can put your material directly to the right place, i.e., use other coordinates in the `\put` statement above.

\AddThispageHook `\AddThispageHook{\langle code \rangle} \equiv \AddToHookNext{shipout/background}{\put(1in,-1in){\langle code \rangle}}`

The `\AddThispageHook` wrapper is similar but uses `\AddToHookNext`.

3 The Implementation

```
1 <@=shipout>
```

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

```
2 {*ekernel | latexrelease}
3 <latexrelease>\IncludeInRelease{2020/10/01}%
4 <latexrelease>           {\shipout}{\Hook management (shipout)}%
5 \ExplSyntaxOn
```

3.1 Debugging

\g__shipout_debug_bool Holds the current debugging state.

```
6 \bool_new:N \g__shipout_debug_bool
```

(End of definition for \g__shipout_debug_bool.)

\shipout_debug_on: Turns debugging on and off by redefining __shipout_debug:n.

```
7 \cs_new_eq:NN \__shipout_debug:n \use_none:n
8 \cs_new_protected:Npn \shipout_debug_on:
9 {
10   \bool_gset_true:N \g__shipout_debug_bool
11   \__shipout_debug_gset:
12 }
13 \cs_new_protected:Npn \shipout_debug_off:
14 {
15   \bool_gset_false:N \g__shipout_debug_bool
16   \__shipout_debug_gset:
17 }
18 \cs_new_protected:Npn \__shipout_debug_gset:
19 {
20   \cs_gset_protected:Npx \__shipout_debug:n ##1
21   { \bool_if:NT \g__shipout_debug_bool {##1} }
22 }
```

(End of definition for \shipout_debug_on: and others. These functions are documented on page 1129.)

\ShipoutBox The box filled with the page to be shipped out (both L3 and L^AT_EX 2 _{ε} name).

```
23 \box_new:N \l_shipout_box
24 \cs_set_eq:NN \ShipoutBox \l_shipout_box
```

(End of definition for \ShipoutBox and \l_shipout_box. These functions are documented on page 1125.)

\l__shipout_raw_box The \RawShipout gets its own box but it is internal as there is no hook manipulation for it.

```
25 \box_new:N \l__shipout_raw_box
```

(End of definition for \l__shipout_raw_box.)

__shipout_finalize_box: For LuaTeX invoke the `pre_shipout_filter` callback.

```

26 \sys_if_engine_luatex:TF
27 {
28   \newprotectedluacmd \_\_shipout_finalize_box:
29   \exp_args:Nx \everyjob {
30     \exp_not:V \everyjob
31     \exp_not:N \lua_now:n {
32       luatexbase.create_callback('pre_shipout_filter', 'list')
33       local~call, getbox, setbox = luatexbase.call_callback, tex.getbox, tex.setbox~
34       lua.get_functions_table() [\the \allocationnumber] = function()
35         local~head = getbox(\the \l_shipout_box)
36         local~result = call('pre_shipout_filter', head)
37         if~not (result == head) then~
38           setbox(\the \l_shipout_box, result~or~nil)
39         end~
40       end
41     }
42   }
43 } {
44   \cs_set_eq:NN \_\_shipout_finalize_box: \scan_stop:
45 }
```

(End of definition for `__shipout_finalize_box:..`)

__shipout_execute: This is going to be the code run by `\shipout`. The code follows closely the ideas from atbegshi, so not documenting that here for now.

```

46 \cs_set_protected:Npn \_\_shipout_execute: {
47   \tl_set:Nx \l__shipout_group_level_tl
48   { \int_value:w \tex_currentgrouplevel:D }
49   \tex_afterassignment:D \_\_shipout_execute_test_level:
50   \tex_setbox:D \l_shipout_box
51 }
```

(End of definition for `__shipout_execute:..`)

\shipout Overloading the `\shipout` primitive:

```
52 \cs_gset_eq:NN \shipout \_\_shipout_execute:
```

(End of definition for `\shipout`. This function is documented on page 1124.)

\l__shipout_group_level_tl Helper token list to record the group level at which `__shipout_execute:` is encountered.

```
53 \tl_new:N \l__shipout_group_level_tl
```

(End of definition for `\l__shipout_group_level_tl`.)

__shipout_execute_test_level: If the group level has changed then we are still constructing `\l_shipout_box` and to continue we need to wait until the current group has finished, hence the `\tex_aftergroup:D`.

```

54 \cs_new:Npn \_\_shipout_execute_test_level: {
55   \int_compare:nNnT
56   \l__shipout_group_level_tl < \tex_currentgrouplevel:D
57   \tex_aftergroup:D \_\_shipout_execute_cont:
58 }
```

(End of definition for `__shipout_execute_test_level:..`)

__shipout_execute_cont: This does the actual shipout running several hooks as part of it. The code for them is passed as argument #2 to #4 to __shipout_execute_main_cont:Nnnn; the first argument is the box to be shipped out.

```

59 \cs_new:Npn \_\_shipout_execute_cont: {
60   \_\_shipout_execute_main_cont:Nnnn
61   \l_shipout_box
62   { \hook_use:n {shipout/before} }
63   { \hook_if_empty:nF {shipout/foreground}
64     { \_\_shipout_add_foreground_picture:n
65       { \hook_use:n {shipout/foreground} } } }
```

If the user hook for the background (shipout/background) has no code, there might still code in the kernel hook so we need to test for this too. We only test for the @kernel@before@shipout@background though. If the @kernel@after@shipout@background needs executing even if the user hook is empty then we can add another test (or the kernel could put something into the before hook).

```

66   \bool_lazy_and:nnF
67   { \hook_if_empty_p:n {shipout/background} }
68   { \tl_if_empty_p:N \@kernel@before@shipout@background }
69   { \_\_shipout_add_background_picture:n
70     { \@kernel@before@shipout@background
71       \hook_use:n {shipout/background}
72       \@kernel@after@shipout@background } }
73   }
74   }
75   { \hook_use:n {shipout/after} }
76 }
```

(End of definition for __shipout_execute_cont:.)

__shipout_execute_main_cont:Nnnn When we have reached this point the shipout box has been processed and is available in \l_shipout_box and ready for real ship out (unless it gets discarded during the process).

The three arguments hold hook code that is executed just before the actual shipout (#1), within the shipout adding background and foreground material (#2) and after the shipout has happened (#3). These are passed as arguments because the same code without those hooks is also used when doing a “raw” shipout implemented by \RawShipout. The only hook that is always executed is that for the very last page, i.e., shipout/lastpage.

First we quickly check if it is void (can’t happen in the standard L^AT_EX output routine but \shipout might be called from a package that has some special processing logic). If it is void we aren’t shipping anything out and processing ends.⁵⁹

```

77 \cs_new:Npn \_\_shipout_execute_main_cont:Nnnn #1#2#3#4 {
78   \box_if_empty:NTF #1
79   { \@latex@warning@no@line{ Ignoring~ void~ shipout~ box } }
80 }
```

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of \protect while we are running the hook code). We also save the current \protect state to restore it later.

```

81 %     \bool_gset_false:N \g__shipout_discard_bool % setting this would disable
82 %                                         % \DiscardShipoutBox on doc-level
```

⁵⁹In that case we don’t reset the deadcycles, that would be up to the OR processing logic to do.

```

83      \cs_set_eq:NN \__shipout_saved_protect: \protect
84      \set@typeset@protect

```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.⁶⁰

```

85      \__shipout_get_box_size:N #1

```

Then we execute the `shipout/before` hook (or nothing in case of `\RawShipout`).

```

86      #2

```

In `\g_shipout_totalpages_int` we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a `\shipout`).

We increment it after running the above hook so that the values for `\g_shipout_totalpages_int` and `\g_shipout_READONLY_int` are in sync while the hook is executed (in the case that `totalpages` isn't manually altered or through discarding pages that is).

```

87      \int_gincr:N \g_shipout_totalpages_int

```

The above hook might contain code that requests the page to be discarded so we now test for it.

```

88      \bool_if:NTF \g__shipout_discard_bool
89      { \@latex@info@no@line{Completed~ page~ discarded}
90      \bool_gset_false:N \g__shipout_discard_bool

```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset TeX's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```

91      \tex_deadcycles:D \c_zero_int

```

Todo: In `atbegshi` the box was dropped but is that actually needed? Or the resetting of `\protect` to its kernel value?

```

92 %
93 %      \group_begin:
94 %      \box_set_eq_drop:NN #1 #1
95 %      \group_end:
96      \cs_set_eq:NN \protect \exp_not:N
}

```

Even if there was no explicit request to discard the box it is possible that the code for the hook `shipout/before` has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```

97      { \box_if_empty:NTF #1
98      { \@latex@warning@no@line { Ignoring~ void~ shipout~ box.
99      \MessageBreak The~ shipout~ box~ was~ voided~ by~ hook~ code }
100     }
}

```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.⁶¹

```

101     {

```

⁶⁰This is not really necessary as the code could access them via `\box_ht:N`, etc., but it is perhaps convenient.

⁶¹Doing that earlier would be wrong because we might end up with the last page counted but discard and then we have no place to add the final objects into the output file.

```

102     \int_gincr:N \g_shipout_READONLY_int
103     \__shipout_DEBUG:n {
104         \typeout{Absolute~ page~ == \int_use:N \g_shipout_READONLY_int
105             \space (target:~ \@abspage@last)}
106     }

```

Then we store the box sizes again (as they may have changed) and then look at the hooks `shipout/foreground` and `shipout/background`. If either or both are non-empty we add a `picture` environment to the box (in the foreground and/or in the background) and execute the hook code inside that environment.

```

107     \__shipout_get_box_size:N #1

```

The first hook we run is the `shipout/firstpage` hook. This is only done once, then the `__shipout_run_firstpage_hook:` command redefines itself to do nothing. If the hook contains `\specials` for integration at the top of the page they will be temporarily stored in a safe place and added later with `__shipout_add_firstpage_specials::`.

```

108     \__shipout_run_firstpage_hook:

```

Run the hooks for background and foreground or, if this is called by `\RawShipout`, copy the box `\l__shipout_raw_box` to `\l_shipout_box` so that `firstpage` and `lastpage` material gets added if necessary (that is always done to `\l_shipout_box`).

```

109     #3

```

We then run `__shipout_add_firstpage_specials:` that adds the content of the hook `shipout/firstpage` to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```

110     \__shipout_add_firstpage_specials:

```

Then we check if we have to add the `shipout/lastpage` hook or the corresponding kernel hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```

111     \int_compare:nNnT \@abspage@last = \g_shipout_READONLY_int
112         { \bool_lazy_and:nnF
113             { \hook_if_empty_p:n {shipout/lastpage} }
114             { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
115             { \__shipout_DEBUG:n { \typeout{Executing~ lastpage~ hook-
116                 on~ page~ \int_use:N \g_shipout_READONLY_int } }
117             \__shipout_add_foreground_box:n
118                 { \UseHook{shipout/lastpage}
119                     \@kernel@after@shipout@lastpage }

```

We record that we have handled the `shipout/lastpage` hook but only if we really did.

```

120         \bool_gset_true:N \g__shipout_lastpage_handled_bool
121     }
122 }
123 \hook_use:n {shipout}
124 \__shipout_finalize_box:

```

Finally we run the actual TeX primitive for shipout. As that will expand delayed `\write` statements inside the page in which protected commands should not expand we first change `\protect` to the appropriate definition for that case.

```

125     \cs_set_eq:NN \protect \exp_not:N
126     \tex_shipout:D \box_use:N \l_shipout_box

```

The `\l_shipout_box` may contain the firstpage material if this was the very first shipout. That makes it unsuitable for reuse in another shipout, so as a safety measure the next command resets `\l_shipout_box` to its earlier state if that is necessary. On later pages this is then a no-op.

```
127          \__shipout_drop_firstpage_specials:
```

The `shipout/after` hook (if in #4) needs to run with `\protected` commands again being executed, because that hook will “typeset” material added at the top of the next page.

```
128          \set@typeset@protect
129          #4
130      }
131 }
```

Restore the value of `\protect` in case `\shipout` is called outside of the output routine (where it is automatically restored because of the implicit group).

```
132          \cs_set_eq:NN \protect \__shipout_saved_protect:
133      }
134 }
```

(End of definition for `__shipout_execute_main_cont:Nnnn`.)

`__shipout_execute_raw:` `__shipout_execute_test_level_raw:` This implements the “raw” shipout which bypasses the before, foreground, background and after hooks. It follows the same pattern than `__shipout_execute_raw:` except that it finally calls `__shipout_execute_main_cont:Nnnn` with three empty arguments, instead of the hook code.

```
135 \cs_set_protected:Npn \__shipout_execute_raw: {
136   \tl_set:Nx \l__shipout_group_level_tl
137   { \int_value:w \tex_currentgrouplevel:D }
138   \tex_afterassignment:D \__shipout_execute_test_level_raw:
139   \tex_setbox:D \l__shipout_raw_box
140 }
141 \cs_new:Npn \__shipout_execute_test_level_raw: {
142   \int_compare:nNnT
143     \l__shipout_group_level_tl < \tex_currentgrouplevel:D
144     \tex_aftergroup:D \__shipout_execute_nohooks_cont:
145 }
```

Well, not totally empty arguments, we add some debugging if we are actually doing a shipout.

```
146 \cs_new:Npn \__shipout_execute_nohooks_cont: {
147   \__shipout_execute_main_cont:Nnnn \l__shipout_raw_box
148   {} { \__shipout_debug:n{ \typeout{Doing~ raw~ shipout~ ...} }
149     \box_set_eq:NN \l__shipout_box \l__shipout_raw_box } {}
150 }
```

(End of definition for `__shipout_execute_raw:` and `__shipout_execute_test_level_raw:..`)

\RawShipout The interface name for raw shipout.

```
151 \cs_gset_eq:NN \RawShipout \__shipout_execute_raw:
```

(End of definition for `\RawShipout`. This function is documented on page 1124.)

`__shipout_saved_protect:` Remember the current `\protect` state.

```
152 \cs_new_eq:NN \__shipout_saved_protect: \protect
```

(End of definition for `__shipout_saved_protect::`)

```
shipout/before  
    shipout  
shipout/after  
shipout/foreground  
shipout/background  
shipout/firstpage  
shipout/lastpage
```

Declaring all hooks for the shipout code.

```
153 \hook_new:n{shipout/before}  
154 \hook_new:n{shipout}  
155 \hook_new:n{shipout/after}  
156 \hook_new:n{shipout/foreground}  
157 \hook_new:n{shipout/background}  
158 \hook_new:n{shipout/firstpage}  
159 \hook_new:n{shipout/lastpage}
```

(End of definition for `shipout/before` and others. These functions are documented on page 1125.)

\@kernel@after@shipout@lastpage
\@kernel@before@shipout@background
\@kernel@after@shipout@background

And here are the internal kernel hooks going before or after the public ones where needed.

```
160 \let@\kernel@after@shipout@lastpage\@empty  
161 \let@\kernel@before@shipout@background\@empty  
162 \let@\kernel@after@shipout@background\@empty
```

(End of definition for `\@kernel@after@shipout@lastpage`, `\@kernel@before@shipout@background`, and `\@kernel@after@shipout@background`.)

`__shipout_run_firstpage_hook:`

There are three commands to handle the `shipout/firstpage` hook: `__shipout_run_firstpage_hook:`, `__shipout_add_firstpage_specials:` and `__shipout_drop_firstpage_specials:`.

That hook is supposed to contain `\specials` and similar material to be placed at the very beginning of the output page and so it needs careful placing to avoid that anything else gets in front of it. And this means we have to wait with this until other hooks such as `shipout/background` have added their bits. It is also important that such `\specials` show up only on the very first page, so if this page gets saved before `\shipout` for later reuse, we have to make sure that they aren't in the saved version.

In addition the hook may also contain code to be executed "first", e.g., visible from code in `shipout/background` and this conflicts with adding the `\specials` late.

Therefore the processing is split into different parts: `__shipout_run_firstpage_hook:` is done early and checks if there is any material in the hook.

```
163 \cs_new:Npn \__shipout_run_firstpage_hook: {  
164     \hook_if_empty:nTF {shipout/firstpage}
```

If not then we define the other two commands to do nothing.

```
165     {  
166         \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:  
167         \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:  
168     }
```

If there is material we execute inside a box, which means any `\special` will end up in that box and any other code is executed and can have side effects (as long as they are global).

```
169     {  
170         \hbox_set:Nn \l__shipout_firstpage_box { \UseHook{shipout/firstpage} }  
171     }
```

Once we are here we change the definition to do nothing next time and we also change the command used to implement \AtBeginDvi to become a warning and not add further material to a hook that is never used again.

```

172  \cs_gset_eq:NN \__shipout_run_firstpage_hook: \prg_do_nothing:
173  \cs_gset:Npn \__shipout_add_firstpage_material:Nn ##1 ##2 {
174      @latex@warning{ First~ page~ is~ already~ shipped~ out,~ ignoring
175          \MessageBreak \string##1 }
176  }
177 }
```

(End of definition for __shipout_run_firstpage_hook:.)

__shipout_add_firstpage_specials:
__shipout_drop_firstpage_specials:
The __shipout_add_firstpage_specials: then adds the \specials stored in \l__shipout_firstpage_box to the page to be shipped out when the time is ready. Note that if there was no material in the shipout/firstpage hook then this command gets redefined to do nothing. But for most documents there is something, e.g., some PostScript header, or some meta data declaration, etc. so by default we assume there is something to do.

```
178 \cs_new:Npn \__shipout_add_firstpage_specials: {
```

First we make a copy of the \l_shipout_box that we can restore it later on.

```
179 \box_set_eq:NN \l__shipout_raw_box \l_shipout_box
```

Adding something to the beginning means adding it to the background as that layer is done first in the output.

```
180 \__shipout_add_background_box:n { \hbox_unpack_drop:N \l__shipout_firstpage_box }
```

After the actual shipout __shipout_drop_firstpage_specials: is run to restore the earlier content of \l_shipout_box and then redefines itself again to do nothing.

As a final act we change the definition to do nothing next time.

```

181 \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:
182 }
```

The __shipout_drop_firstpage_specials: is run after the shipout has occurred but before the shipout/afterpage hook is executed. That is the point where we have to restore the \ShipoutBox to its state without the shipout/firstpage material.

```

183 \cs_new:Npn \__shipout_drop_firstpage_specials: {
184     \box_set_eq:NN \l_shipout_box \l__shipout_raw_box
```

If there was no such material then __shipout_run_firstpage_hook: will have changed the definition to a no-op already. Otherwise this is what we do here.

```

185     \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:
186 }
```

*(End of definition for __shipout_add_firstpage_specials: and
__shipout_drop_firstpage_specials:.)*

\l__shipout_firstpage_box The box to hold any firstpage \specials.

```
187 \box_new:N \l__shipout_firstpage_box
```

(End of definition for \l__shipout_firstpage_box.)

\g__shipout_lastpage_handled_bool A boolean to signal if we have already handled the shipout/lastpage hook.

```
188 \bool_new:N \g__shipout_lastpage_handled_bool
```

(End of definition for \g__shipout_lastpage_handled_bool.)

`_shipout_add_firstpage_material:Nn` This command adds material to the `shipout/firstpage` hook. It is used in `\AtBeginDvi`, etc. The first argument is the command through which it is called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

```
189 \cs_new:Npn \_shipout_add_firstpage_material:Nn #1#2 {
190     \AddToHook{shipout/firstpage}{#2}
191 }
```

(End of definition for `_shipout_add_firstpage_material:Nn`.)

`_shipout_get_box_size:N` Store the box dimensions in dimen registers.

Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.

```
192 \cs_new:Npn \_shipout_get_box_size:N #1 {
193     \dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }
194     \dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }
195     \dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }
196     \dim_set:Nn \l_shipout_box_ht_plus_dp_dim
197         { \l_shipout_box_ht_dim + \l_shipout_box_dp_dim }
198 }
```

(End of definition for `_shipout_get_box_size:N`.)

`\l_shipout_box_ht_dim` And here are the variables set by `_shipout_get_box_size:N`.

`\l_shipout_box_dp_dim`
`\l_shipout_box_wd_dim`
`\l_shipout_box_ht_plus_dp_dim`

(End of definition for `\l_shipout_box_ht_dim` and others. These functions are documented on page 1125.)

`\g__shipout_discard_bool` Indicate whether or not the current page box should be discarded

```
203 \bool_new:N \g__shipout_discard_bool
```

(End of definition for `\g__shipout_discard_bool`.)

`\l__shipout_tmp_box` We need a box for the background and foreground material and a token register to remember badness settings as we disable them during the buildup below.
`\l__shipout_saved_badness_tl`

```
204 \box_new:N \l__shipout_tmp_box
205 \tl_new:N \l__shipout_saved_badness_tl
```

(End of definition for `\l__shipout_tmp_box` and `\l__shipout_saved_badness_tl`.)

`_shipout_add_background_box:n` In standard L^AT_EX the shipout box is always a `\vbox` but here we are allow for other usage as well, in case some package has its own output routine.

```
206 \cs_new:Npn \_shipout_add_background_box:n #1
207 { \_shipout_get_box_size:N \l_shipout_box
```

But we start testing for a vertical box as that should be the normal case.

```
208     \box_if_vertical:NTF \l_shipout_box
209     {
```

Save current values of `\vfuzz` and `\vbadness` then change them to allow box manipulations without warnings.

```

210      \tl_set:Nx \l__shipout_saved_badness_tl
211      { \vfuzz=\the\vfuzz\relax
212        \vbadness=\the\vbadness\relax }
213      \vfuzz=\c_max_dim
214      \vbadness=\c_max_int

```

Then we reconstruct `\l_shipout_box` ...

```

215      \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
216      {

```

... the material in #1 is placed into a horizontal box with zero dimensions.

```

217      \hbox_set:Nn \l__shipout_tmp_box
218      { \l__shipout_saved_badness_tl #1 }
219      \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
220      \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
221      \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

The we typeset that box followed by whatever was in `\l_shipout_box` before (unpacked).

```

222      \skip_zero:N \baselineskip
223      \skip_zero:N \lineskip
224      \skip_zero:N \lineskiplimit
225      \box_use:N \l__shipout_tmp_box
226      \vbox_unpack:N \l_shipout_box

```

The `\kern` ensures that the box has no depth which is afterwards explicitly corrected.

```

227      \kern \c_zero_dim
228      }
229      \box_set_ht:Nn \l_shipout_box \l_shipout_box_ht_dim
230      \box_set_dp:Nn \l_shipout_box \l_shipout_box_dp_dim

```

Todo: The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.

```

231      \l__shipout_saved_badness_tl
232      }
233      {

```

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

```

234      \box_if_horizontal:NT \l_shipout_box
235      {
236          \tl_set:Nx \l__shipout_saved_badness_tl
237          { \hfuzz=\the\hfuzz\relax
238            \hbadness=\the\hbadness\relax }
239          \hfuzz=\c_max_dim
240          \hbadness=\c_max_int
241          \hbox_set_to_wd:Nnn \l_shipout_box \l_shipout_box_wd_dim
242          {
243              \hbox_set:Nn \l__shipout_tmp_box
244              { \l__shipout_saved_badness_tl #1 }
245              \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
246              \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
247              \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

```

248          \box_move_up:nn
249              \l_shipout_box_ht_dim
250              { \box_use:N \l_shipout_tmp_box }
251          \hbox_unpack:N \l_shipout_box
252      }
253      \l__shipout_saved_badness_tl
254  }
255 }
256 }
```

(End of definition for `_shipout_add_background_box:n`.)

`_shipout_add_foreground_box:n` Foreground boxes are done in the same way, only the order and placement of boxes has to be done differently.

```

257 \cs_new:Npn \_shipout_add_foreground_box:n #1
258 {
259     \box_if_vertical:NTF \l_shipout_box
260     {
261         \tl_set:Nx \l__shipout_saved_badness_tl
262             { \vfuzz=\the\vfuzz\relax
263                 \vbadness=\the\vbadness\relax }
264         \vfuzz=\c_max_dim
265         \vbadness=\c_max_int
266         \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
267         {

306      \l__shipout_saved_badness_tl
307  }
308 }
309 }
```

(End of definition for `__shipout_add_foreground_box:n`.)

`__shipout_init_page_origins:`
`\c__shipout_horigin_tl`
`\c__shipout_vorigin_tl`

Two constants holding the offset of the top-left with respect to the media box.

Setting the constants this way is courtesy of Bruno.

We delay setting the constants to the last possible place as there might be updates in the preamble or even in the `begindocument` hook that affects their setup.

```

310 \cs_new:Npn \__shipout_init_page_origins: {
311     \tl_const:Nx \c__shipout_horigin_tl
312     {
313         \cs_if_exist_use:NTF \pdfvariable { horigin }
314             { \cs_if_exist_use:NF \pdfhorigin { 1in } }
315     }
316     \tl_const:Nx \c__shipout_vorigin_tl
317     {
318         \cs_if_exist_use:NTF \pdfvariable { vorigin }
319             { \cs_if_exist_use:NF \pdfvorigin { 1in } }
320     }
321 }
```

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```

321     \cs_gset_eq:NN \__shipout_init_page_origins: \prg_do_nothing:
322 }
```

(End of definition for `__shipout_init_page_origins:`, `\c__shipout_horigin_tl`, and `\c__shipout_vorigin_tl`.)

`__shipout_picture_overlay:n` Put the argument into a `picture` environment that doesn't take up any size and uses `1pt` for `\unitlength`.

Todo: Could perhaps be generalized as it might be useful elsewhere. For now it is not.

```

323 \cs_new:Npn \__shipout_picture_overlay:n #1 {
```

The very first time this is executed we have to initialize (and freeze) the origins.

```

324     \__shipout_init_page_origins:
325     \kern -\c__shipout_horigin_tl \scan_stop:
326     \vbox_to_zero:n {
327         \kern -\c__shipout_vorigin_tl \scan_stop:
328         \unitlength 1pt \scan_stop:
```

This mimics a simple zero-sized picture environment. The `\hss` is need in case there is horizontal material (without using `\put` with a positive width).

```

329      \hbox_set_to_wd:Nnn \l__shipout_tmp_box \c_zero_dim
330          { \ignorespaces #1 \hss }
331      \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
332      \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
333      \box_use:N \l__shipout_tmp_box
334      \tex_vss:D
335  }
336 }
```

(End of definition for `__shipout_picture_overlay:n`.)

`__shipout_add_background_picture:n`

Put a `picture` env in the background of the shipout box with its reference point in the top-left corner.

```

337 \cs_new:Npn \__shipout_add_background_picture:n #1 {
338     \__shipout_add_background_box:n { \__shipout_picture_overlay:n {#1} }
339 }
```

(End of definition for `__shipout_add_background_picture:n`.)

`__shipout_add_foreground_picture:n`

Put a `picture` env in the foreground of the shipout box with its reference point in the top-left corner.

```

340 \cs_new:Npn \__shipout_add_foreground_picture:n #1 {
341     \__shipout_add_foreground_box:n { \__shipout_picture_overlay:n {#1} }
342 }
```

(End of definition for `__shipout_add_foreground_picture:n`.)

`\shipout_discard:`

Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case L^AT_EX looks ahead and is not using the position for on the next page).

```

343 \cs_new_protected:Npn \shipout_discard: {
344     \bool_gset_true:N \g__shipout_discard_bool
345 }
```

(End of definition for `\shipout_discard:`. This function is documented on page 1128.)

3.2 Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

`\g_shipout_READONLY_int`
`\ ReadonlyShipoutCounter`

We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

```
346 \int_new:N \g_shipout_READONLY_int
```

For L^AT_EX 2_ε it is available as a command (i.e., a T_EX counter only).

```
347 \cs_new_eq:NN \ ReadonlyShipoutCounter \g_shipout_READONLY_int
```

(End of definition for `\g_shipout_READONLY_int` and `\ ReadonlyShipoutCounter`. These functions are documented on page 1129.)

`\g_shipout_totalpages_int`
`\c@totalpages`

We count every shipout attempt (even those that are discarded) in this counter. It is not used in the code but may get used in user code.

348 `\int_new:N \g_shipout_totalpages_int`

For L^AT_EX 2 _{ε} this is offered as a L^AT_EX counter so can be easily typeset inside the output routine to display things like “`\thepage/\thetotalpages`”, etc.

349 `\cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int`
350 `\cs_new:Npn \thetotalpages { \arabic{totalpages} }`

(End of definition for `\g_shipout_totalpages_int` and `\c@totalpages`. These functions are documented on page 1129.)

`\@abspage@last`

In `\@abspage@last` record the number of pages from the last run. This is written to the .aux and this way made available to the next run. In case there is no .aux file or the statement is missing from it we initialize it with the largest possible number in T_EX. We use this as the default because then we are inserting the `shipout/lastpage` on the last page (or after the last page) but not on page 1 for a multipage document.

351 `\xdef\@abspage@last{\number\maxdimen}`

(End of definition for `\@abspage@last`.)

`\enddocument`

Instead of using the hooks `enddocument` and `enddocument/afterlastpage` we add this code to private kernel hooks to be 100% sure when it is executed and to avoid cluttering the hooks with data that is always there.

Inside `\enddocument` there is a `\clearpage`. Just before that we execute this code here. There is a good chance that we are on the last page. Therefore, if we don't know the value from the last run, we assume that the current page is the right one. So we set `\@abspage@last` and as a result the next shipout will run the `shipout/lastpage` code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

`\@kernel@after@enddocument`

352 `\g@addto@macro \@kernel@after@enddocument {`
353 `\int_compare:nNnT \@abspage@last = \maxdimen`
354 `{`

We use L^AT_EX 2 _{ε} coding as `\@abspage@last` is not an L3 name.

355 `\xdef\@abspage@last{ \int_eval:n {\g_shipout_READONLY_int + 1} }`
356 `}`
357 `}`

Once the `\clearpage` has done its work inside `\enddocument` we know for sure how many pages this document has, so we record that in the .aux file for the next run.

`\@kernel@after@enddocument@afterlastpage`

358 `\g@addto@macro \@kernel@after@enddocument@afterlastpage {`

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to ran the `shipout/lastpage` is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

359 `\int_compare:nNnF \g_shipout_READONLY_int = 0`
360 `{`

This ends up in the .aux so we use L^AT_EX 2 _{ε} names here.

Todo: This needs an interface for \nofiles in expl3, doesn't at the moment!

```

361      \if@filesw
362          \iow_now:Nx \@auxout {
363              \gdef\string\@abspage@last {\int_use:N \g_shipout_READONLY_int}
364      \fi

```

But we may have guessed wrongly earlier and have run it too early or we still have to run the `shipout/lastpage` even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy. In either case we should put out an appropriate “rerun” warning.

```

365      \bool_if:NTF \g__shipout_lastpage_handled_bool
366          {

```

If the hook was already executed, we have to test if that total shipouts match the shipouts from last run (because that corresponds to the page it was executed). If not we output a warning.

```

367          \int_compare:nNnF \@abspage@last = \g_shipout_READONLY_int
368          {
369              \@latex@warning@no@line{Hook~ 'shipout/lastpage'~ executed-
370                  on~ wrong~ page~ (\@abspage@last\space not-
371                  \int_use:N\g_shipout_READONLY_int). \MessageBreak
372                  Rerun~ to~ correct~ this}%
373          }
374      }
375      {

```

If the hook was not run, we need to add an extra page and place it there. However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if `\@kernel@after@shipout@lastpage` contains any code. If both are empty we omit the page generation.

```

376      \bool_lazy_and:nnF
377          { \hook_if_empty_p:n {shipout/lastpage} }
378          { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
379          {
380              \tex_shipout:D\vbox to\textheight
381              {
382                  \hbox:n { \UseHook{shipout/lastpage}
383                      \@kernel@after@shipout@lastpage }

```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```

384          \__shipout_excuse_extra_page:
385          \null
386      }

```

At this point we also signal to L^AT_EX's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested in `\enddocument`.

```

387          \cs_gset_eq:NN \@extra@page@added \relax
388          }
389      }
390  }
391 }

```

(End of definition for `\enddocument`, `\@kernel@after\enddocument`, and
`\@kernel@after\enddocument@afterlastpage`.)

```

\_shipout_excuse_extra_page: Say mea culpa ...
392 \cs_new:Npn \_shipout_excuse_extra_page: {
393   \vfil
394   \begin{center}
395     \bfseries Temporary~ page!
396   \end{center}

404   how~ many~ pages~ to~ expect~ for~ this~ document.
405   \vfil
406 }
```

(End of definition for `_shipout_excuse_extra_page`.)

`\PreviousTotalPages` In the preamble before the aux file was read `\PreviousTotalPages` is always zero.
`@kernel@before@begindocument`

In the aux file there should be an update for `\abspage@last` recording the number of pages from the previous run. If not that macro holds the value of `\maxdimen`. So we test for it and update `\PreviousTotalPages` if there was a real value. This should happen just before the `begindocument` hook is executed so that the value can be used inside that hook.

```

408 \g@addto@macro\@kernel@before@begindocument
409   {\ifnum\abspage@last<\maxdimen
410     \xdef\PreviousTotalPages{\abspage@last}\fi}
```

(End of definition for `\PreviousTotalPages` and `\@kernel@before@begindocument`. These functions are documented on page [1129](#).)

4 Legacy L^AT_EX 2_& interfaces

`\DiscardShipoutBox` Request that the next shipout box is to be discarded.

```

411 \cs_new_eq:NN \DiscardShipoutBox \shipout_discard:
```

(End of definition for `\DiscardShipoutBox`. This function is documented on page [1128](#).)

`\AtBeginDvi` If we roll forward from an earlier kernel `\AtBeginDvi` is defined so we better not use `\cs_new_protected:Npn` here.

```

412 \cs_set_protected:Npn \AtBeginDvi
413   {\_shipout_add_firstpage_material:Nn \AtBeginDvi}
```

(End of definition for `\AtBeginDvi`. This function is documented on page [1127](#).)

`\DebugShipoutsOn`

`\DebugShipoutsOff`

```

414 \cs_new_eq:NN \DebugShipoutsOn \shipout_debug_on:
415 \cs_new_eq:NN \DebugShipoutsOff \shipout_debug_off:
```

(End of definition for `\DebugShipoutsOn` and `\DebugShipoutsOff`. These functions are documented on page [1129](#).)

5 Internal commands needed elsewhere

These internal commands use double and triple @ signs so we need to stop getting them translated to the module name.

416 ⟨@@=⟩

Some internals needed elsewhere.

\AtBeginShipout

Filling hooks

```

496 \protected\long\def\AtBeginShipout      #1{\AddToHook{shipout/before}{#1}}
497 \protected\long\def\AtBeginShipoutNext #1{\AddToHookNext{shipout/before}{#1}}

```

(*End of definition for \AtBeginShipout and \AtBeginShipoutNext. These functions are documented on page 1131.*)

\AtBeginShipoutFirst

Slightly more complex as we need to know the name of the command under which the shipout/firstpage hook is filled.

```

498 \protected \def \AtBeginShipoutFirst
499     {\Expl@@@shipout@add@firstpage@material@Nn \AtBeginShipoutFirst}

```

(*End of definition for \AtBeginShipoutFirst. This function is documented on page 1131.*)

\AtBeginShipoutDiscard

Just a different name.

```
500 \let \AtBeginShipoutDiscard \DiscardShipoutBox
```

(*End of definition for \AtBeginShipoutDiscard. This function is documented on page 1131.*)

\AtBeginShipoutAddToBox

We don't expose them.

```

501 \let \AtBeginShipoutAddToBox
502     \Expl@@@shipout@add@background@box@Nn
503 \let \AtBeginShipoutAddToBoxForeground
504     \Expl@@@shipout@add@foreground@box@Nn
505 \let \AtBeginShipoutUpperLeft
506     \Expl@@@shipout@add@background@picture@Nn
507 \let \AtBeginShipoutUpperLeftForeground
508     \Expl@@@shipout@add@foreground@picture@Nn

```

(End of definition for \AtBeginShipoutAddToBox and others. These functions are documented on page 1130.)

\AtBeginShipoutOriginalShipout

This offers the raw \shipout primitive of the engine. A page shipped out with this is not counted by \ ReadonlyShipoutCounter counter and thus the mechanism to place \specials at the very end of the output might fail, etc. It should therefore not be used in new applications but is only provided to allow running legacy code. For new code use the commands provided by the kernel instead.

```
509 \ExplSyntaxOn
510 \cs_new_eq:NN \AtBeginShipoutOriginalShipout \tex_shipout:D
```

(End of definition for \AtBeginShipoutOriginalShipout. This function is documented on page 1130.)

\ShipoutBoxHeight \ShipoutBoxWidth \ShipoutBoxDepth

This is somewhat different from the original in atbegshi where \ShipoutBoxHeight etc. only holds the \the\ht<box> value. This may has some implications in some use cases and if that is a problem then it might need changing.

```
511 \cs_new:Npn \ShipoutBoxHeight { \dim_use:N \l_shipout_box_ht_dim }
512 \cs_new:Npn \ShipoutBoxDepth { \dim_use:N \l_shipout_box_dp_dim }
513 \cs_new:Npn \ShipoutBoxWidth { \dim_use:N \l_shipout_box_wd_dim }
514 \ExplSyntaxOff
```

(End of definition for \ShipoutBoxHeight, \ShipoutBoxWidth, and \ShipoutBoxDepth.)

```
515 
```

If the package is requested we substitute the one above:

```
516 {*2ekernel}
517 \declare@file@substitution{atbegshi.sty}{atbegshi-ltx.sty}
518 
```

6.3 Package **everyshi** emulation

This is now directly handled in that package so emulation is not necessary any more.

Rather important :-)

```
519 
```

1.1 Historical notes on the algorithm and commands

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
***** OUTPUT *****
```

PAGE LAYOUT PARAMETERS

```
\topmargin      : Extra space added to top of page.
@twoside       : boolean. T if two-sided printing
\oddsidemargin : IF @twoside = T
                  THEN extra space added to left of odd-numbered
                  pages.
                  ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                  THEN extra space added to left of even-numbered
                  pages.
\headheight    : height of head
\headsep       : separation between head and text
\footskip      : distance separation between baseline of last
                  line of text and baseline of foot.
                  Note difference between \footSKIP and \headSEP.
\textheight    : height of text on page, excluding head and foot
\textwidth     : width of printing on page
\columnsep     : IF @twocolumn = T
                  THEN width of space between columns
\columnseprule : IF @twocolumn = T
                  THEN width of rule between columns (0 if none).
\columnwidth   : IF @twocolumn = T
                  THEN (\textwidth - \columnsep)/2
                  ELSE \textwidth
                  It is set by the \twocolumn and
                  \onecolumn commands.
\@textbottom  : Command executed at bottom of vbox holding text of
                  page (including figures). The \raggedbottom
                  command almost \let's this to \vfil (actually sets
                  it to \vskip \z@ plus.0001fil).
                  Should have depth 0pt.
```

`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.
`\textfloatsep` : Space between last top float or first bottom float and the text.
`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)
`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.
`\intextsep` : Space left on top and bottom of an in-text float.
`\dblfloatsep` : Space between double-column floats.
`\dbltextfloatsep` : Space between top double-column floats and text.
`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.
`\@fptop` : Glue to go at top of float column – must be 0pt + stretch
`\@fpsep` : Glue to go between floats in a float column.
`\@fpbot` : Glue to go at bottom of float column – must be 0pt + stretch
`\@dblfpsep, \@dblfpbot` : Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

`\@oddhead` : IF `@twoside = T`
 THEN macro to generate head of odd-numbered pages.
 ELSE macro to generate head of all pages.
`\@evenhead` : IF `@twoside = T`
 THEN macro to generate head of even-numbered

```

          pages.
\@oddfoot      : IF @twoside = T
                  THEN macro to generate foot of odd-numbered
                  pages.
                  ELSE macro to generate foot of all pages.
\@evenfoot     : IF @twoside = T
                  THEN macro to generate foot of even-numbered
                  pages.
@specialpage   : boolean. T if current page is to have a special
                  format.
\@specialstyle : If its value is foo then
                  IF @specialpage = T
                  THEN the command \ps@foo is executed to
                  temporarily reset the page style parameters
                  before composing the current page.
                  This command should execute only \def's and
                  \edef's, making only local definitions.

```

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`. When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

- * For single-column page it equals `\textheight`.
- * For double-column page it equals `\textheight - height of double-column floats on page`.

Note that some are set globally and some locally:

```

\@topnum :=G Maximum number of floats allowed on the top of a
            column.
\@toproom :=G Maximum amount of top of column devoted to floats-
            excluding \textfloatsep separation below the floats
            and \floatsep separation between them. For
            two-column output, should be computed as a function
            of \@colht.
\@botnum, \@botroom
            : Analogous to above.
\@colnum :=G Maximum number of floats allowed in a column,
            including in-text floats.
\@textmin :=L Minimum amount of text (excluding footnotes) that
            must appear on a text page.
%% 27 Sep 85 : made local to
%% \@addtocurcol and \@addtonextcol
            It is now also used locally in processing double
            floats.
\@fpmin    :=L Minimum height of floats in a float column.

```

The macro `\@dblfloatplacement` sets the following parameters.

```

\@dbltopnum  :=G Maximum number of double-column floats allowed at
            the top of a two-column page.
\@dbltoproom :=G Maximum height of double-column floats allowed at

```

top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.
 It should also perform the following local assignments where necessary
 – i.e., where the new value differs from the old one:

```

\@fptop      :=L \@dblftop
\@fpsep     :=L \@dblfpsep
\@fpbot      :=L \@dblfpbot
  
```

OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty < or = -10000 in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

penalty	reason
-10000	<code>\pagebreak</code> <code>\newpage</code>
-10001	<code>\clearpage</code> (<code>\penalty -10000 \vbox{}</code>) <code>\penalty -10001</code>)
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list:
 (i) a penalty of -10004,
 (ii) a null `\vbox`
 (iii) a penalty of -10002 or -10003.
 This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.
 Also sets `\@colht :=G \textheight`.
 The page style is determined as follows.
 IF `@thispagestyle` = true
 THEN use `\thispagestyle` style
 ELSE use ordinary page style.

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:
 `\@colht` : height of box
 `\@fpmin` : minimum height of floats in the box
 `\@fpsep` : interfloat space
 `\@fptop` : glue at top of box
 `\@fpbot` : glue at bottom of box.
 If it succeeds, then it does the following:
 * `\@outputbox :=L` the composed float box.
 * `@fcollmade :=G true`
 * `\FLIST :=G \FLIST - floats put in box`
 * `\@freelist :=G \@freelist + floats put in box`
 If it fails, then:
 * `@fcollmade :=G false`

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :
 Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcollmade` = false, then:
 * Globally sets `\@toplist` and `\@botlist` to floats from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.

- * Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolumn` :

- Calls `\@tryfcolumn\@dbldeferlist{8}`. If `\@tryfcolumn` returns with (globally set) `@fcolmade` = false, then:
 - * Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
 - * Globally sets `\@colht` to `\textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box `\@outputbox` with the floats from `\@toplister` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\TOPLIST` and `\BOTLIST` onto `\@freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplister` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`

- If `@twocolumn` = false, then it calls `\@outputpage`, sets `\@colht :=G \textheight`, and calls `\@floatplacement`.

If `@twocolumn` = true, then:

- If `@firstcolumn` = true, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G` false.

If `@firstcolumn` = false, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltoplist` for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
              \write -1{}    % Part of hack to make sure no

```

```

    \vbox{}           % \write's get lost.
    \penalty -10001
END

\cleardoublepage == BEGIN \clearpage
    if @twoside = true and c@page is even
        then \hbox{} \newpage fi
END

```

\twocolumn[BOX] : starts a new page, changing to twocolumn setting
and puts BOX in a parbox of width \textwidth across the top.
Useful for full-width titles for double-column pages.
SURPRISE: The stretch from \dbltextfloatsep will be inserted
between the BOX and the top of the two columns.

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the \freelist (see below for a description of list manipulation), puts the float into box B and sets \count B to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: \vadjust{\penalty -10002}
- In vmode : \penalty -10003.

For a double-column float, it puts B onto the \dbldeferlist.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may be placed.
- * A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float
6	1 iff a type 2 float
	etc.

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa` ... `\boxN` has the form:

\@elt \boxa ... \@elt \boxN
where \boxI is defined by
 \newinsert\boxI

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {\NONEMPTY}{\EMPTY} ==  %% NOTE: ASSUME \@elt
= \relax
  BEGIN assume that \LIST == \@elt \B1 ... \@elt \Bn
    if n = 0
      then EMPTY
    else \CS :=L \B1
      \LIST :=G \@elt \B2 ... \@elt \Bn
      NONEMPTY
    fi
  END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all I of bit $\log_2 \NUM$ of the float specifiers of all the floats in `\LIST`.

I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit $\log_2 \NUM$ of its float specifier equal to 1.

Note: $\log_2 [(\count I)/32]$ is the bit number corresponding to the type of float I. To see if there is any float in `\LIST` having the same type as float I, you run `\@bitor` with
`\NUM = [(\count I)/32] * 32`.

```
\@bitor\NUM\LIST ==
  BEGIN
    @test :=G false
    { \@elt \CTR ==  if \NUM <> 0 then
        if \count\CTR / \NUM is odd
          then @test := true      fi fi
      \LIST
    }
  END
```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```

\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
          \LIST :=G \LIST \@elt \NUM
}

```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

\@freelist	: List of empty boxes for placing new floats.
\@toplist	: List of floats to go at top of current column.
\@midlist	: List of floats in middle of current column.
\@botlist	: List of floats to go at bottom of current column.
\@deferlist	: List of floats to go after current column.
\@dbltoplist	: List of double-col. floats to go at top of current page.
\@dbldeferlist	: List of double-column floats to go on subsequent pages.

FLOAT-PLACEMENT ALGORITHMS

\@addtobot : Tries to put insert \@currbox on \@botlist.

Called only when:

- * \ht BOX < \@colroom
 - * type of \@currbox not on \@deferlist
 - * \@colnum > 0
 - * @insert = false
- If it succeeds, then:
- * sets @insert true
 - * decrements \@botroom by \ht BOX
 - * decrements \@botnum and \@colnum by 1
 - * decrements \@colroom by \ht BOX + either \floatsep or \textfloatsep, as appropriate.
 - * sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or \@botlist.

Called only under same conditions as \@addtobot.

If it succeeds, then:

- * sets @insert true
- * decrements \@toproom or \@botroom by \ht BOX
- * decrements \@colnum and either \@topnum or \@botnum by 1
- * decrements \@colroom by \ht BOX + \floatsep or \textfloatsep, as appropriate.

\@addtocurcol : Tries to add \@currbox to current column, setting @insert true if it succeeds, false otherwise.

It will add \@currbox to top only if bit 0 of \count \@currbox is 0, and to the bottom only if

bit 0 = 0 or an earlier float of the same type is put on the bottom.
 If the float is put in the text, then `\penalty\interlinepenalty` is put right after the float, before the following `\vskip`, and `\outputpenalty :=L 0`.

```
\@addtonextcol : Tries to add \currbox to the next column, setting
  @insert true if it succeeds, false otherwise.

\@addtobdblcol : Tries to add \currbox to the next double-column page,
  adding it to \dbltoplist if it succeeds and
  \dbldeflist if it fails.

\@addmarginpar ==
BEGIN
  if \currlist nonempty
    then remove \marbox from \currlist
    add \marbox and \currbox to \freelist
      %% NOTE: \currbox = left box
    else LaTeX error: ? %% shouldn't happen
  fi
  \tempcnta := 1 %% 1 = right, -1 = left

62  \gdef\@midlist{}
63  \gdef\@currlist{}
64  \gdef\@deferlist{}
65  \gdef\@dbltoplist{}

```

The new algorithm stores page wide floats together with column floats in a single `\@deferlist` list. We keep `\@dbldeferlist` initialised as empty so that packages that are testing for deferred floats can use the same code for old or new float handling.

```
66 \gdef\@dbldeferlist{}
```

1.2.2 Page layout parameters

```

67 \newdimen\topmargin
68 \newdimen\oddsidemargin
69 \newdimen\evensidemargin
70 \let\@themargin=\oddsidemargin
71 \newdimen\headheight
72 \newdimen\headsep
73 \newdimen\footskip
74 \newdimen\textheight
75 \newdimen\textwidth
76 \newdimen\columnwidth

```

```

77 \newdimen\columnsep
78 \newdimen\columnseprule
79 \newdimen\marginparwidth
80 \newdimen\marginparsep
81 \newdimen\marginparpush

```

\AtBeginDvi We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

This interface is no longer used. Instead a new one is inside `ltshipout.dtx`. We only keep the box in case some old code refers to it directly (or we do some rollback).

```

82 \newbox\@begindvibox
83 %\DeclareRobustCommand \AtBeginDvi [1]{%
84 % \global \setbox \@begindvibox
85 % \vbox{\unvbox \@begindvibox #1}%
86 %}

```

(*End of definition for \AtBeginDvi and \@begindvibox. These functions are documented on page 1127.*)

\@maxdepth This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```

87 \newdimen\@maxdepth
88 \@maxdepth = \maxdepth

```

(*End of definition for \@maxdepth.*)

\paperheight New `\paper...` registers.

```

89 \newdimen\paperheight
90 \newdimen\paperwidth

```

(*End of definition for \paperheight and \paperwidth.*)

\stockheight New `\stock...` registers.

```

91 \newdimen\stockheight
92 \newdimen\stockwidth

```

(*End of definition for \stockheight and \stockwidth.*)

`\if@insert` Local switches first:

```

93 \newif \if@insert

```

`\if@fcolmade` These should definitely be global:

```

94 \newif \if@fcolmade
95 \newif \if@specialpage \c@specialpagefalse

```

`\if@firstcolumn` These should be global but are not always set globally in other files.

```

96 \newif \if@firstcolumn \c@firstcolumntrue
97 \newif \if@twocolumn \c@twocolumnfalse

```

`\if@reversemargin`

`\if@mparswitch`

`\col@number`

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```
98 \newif \if@twoside      \@twosidefalse
99 \newif \if@reversemargin \creversemarginfalse
100 \newif \if@mparswitch   \cmparswitchfalse
```

This counter has been imported from ‘multicol’.

```
101 \newcount \col@number
102 \col@number \cne
```

(End of definition for \if@insert and others.)

120 \newbox\@holdpg
121 \def\@thehead{\@oddhead} % initialization
122 \def\@thefoot{\@oddfoot}
```

1.2.4 Page break commands

\clearpage The tests at the beginning are an experimental attempt to avoid a completely empty page after a \twocolumn[...]. This prevents the text from the argument vanishing into a float box, never to be seen again. We hope that it does not produce wrong formatting in other cases.

```
123 \def\clearpage{%
124   \ifvmode
125     \ifnum \@dbltopnum =\m@ne
126       \ifdim \pagetotal <\topskip
127         \hbox{}%
128       \fi
129     \fi
130   \fi
131   \newpage
132   \write\m@ne{}%
133   \vbox{}%
134   \penalty -\@Mi
135 }
```

(End of definition for \clearpage.)

```
\cleardoublepage
136 \def\cleardoublepage{\clearpage\if@twoside \ifodd\c@page\else
137     \hbox{}\newpage\if@twocolumn\hbox{}\newpage\fi\fi\fi}
138 \/2ekernel}

(End of definition for \cleardoublepage.)
```

\onecolumn

```
139 \*2ekernel | fltrace
140 \def\onecolumn{%
141     \clearpage
142     \global\columnwidth\textwidth
143     \global\hsize\columnwidth
144     \global\linewidth\columnwidth
145     \global\@twocolumnfalse
146     \col@number \@ne
147     \floatplacement}
```

(End of definition for \onecolumn.)

\newpage

The two checks at the beginning ensure that an item label or run-in section title immediately before a \newpage get printed on the correct page, the one before the page break.

All three tests are largely to make error processing more robust; that is why they all reset the flags explicitly, even when it would appear that this would be done by a \leavevmode.

```
148 \/2ekernel | fltrace
149 \ latexrelease\IncludeInRelease{2017/04/15}%
150 \ latexrelease\newpage{Check depth of page}%
151 \*2ekernel | latexrelease | fltrace
152 \def \newpage {%
153     \if@noskipsec
154         \ifx \nodocument\relax
155             \leavevmode
156             \global \nobreakfalse
157         \fi
158     \fi
159     \if@inlabel
160         \leavevmode
161         \global \inlabelfalse
162     \fi
163     \if@nobreak \nobreakfalse \everypar{} \fi
164     \par}
```

The \vfil at the end of the macro before the break penalty will normally result in the page being run short, even with \flushbottom in effect (in contrast to the behavior of \pagebreak). However, if there is some explicit stretch on the page, say, a \vfill, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of \prevdepth is no longer taken into account by TeX. So we back up by that amount (or by \maxdepth if it is really huge), to mimic the normal behavior without the \newpage.

```
165 \ifdim\prevdepth>\z@
```

```

166      \vskip -%
167      \ifdim\prevdepth>\maxdepth
168          \maxdepth
169      \else
170          \prevdepth
171      \fi
172  \fi
173  \vfil
174  \penalty -\@M}
175  {/2ekernel | latexrelease | fltrace}
176  \EndIncludeInRelease
177  \IncludeInRelease{0000/00/00}%
178  \IncludeInRelease{\newpage}{Check depth of page}%
179  \def \newpage {%
180  \if@noskipsec
181  \ifx \@nodocument\relax
182  \leavevmode
183  \global \c@noskipsecfalse
184  \fi
185  \fi
186  \if@inlabel
187  \leavevmode
188  \global \c@inlabelfalse
189  \fi
190  \if@nobreak \c@nobreakfalse \everypar{}\fi
191  \par
192  \vfil
193  \penalty -\@M}
194  \EndIncludeInRelease
195  {*2ekernel | fltrace}

```

(End of definition for \newpage.)

\@emptycol It may be better to use an invisible rule rather than an empty box here.

```
196 \def \@emptycol {\vbox{} \penalty -\@M}
```

(End of definition for \@emptycol.)

\twocolumn There are several bug fixes to the two-column stuff here.

```
197 \def \twocolumn {%
198  \clearpage
199  \global \columnwidth \textwidth
200  \global \advance \columnwidth -\columnsep
201  \global \divide \columnwidth \tw@
202  \global \hsize \columnwidth
203  \global \linewidth \columnwidth
204  \global \c@twocolumntrue
205  \global \c@firstcolumntrue
206  \col@number \tw@}
```

There is no reason to put a \cdblfloatplacement here since \@topnewpage ignores these settings. The \cfloatplacement is needed in case this comes after some changes.

```
207  \c@ifnextchar [\@topnewpage \cfloatplacement
208  ]
```

Note that here, getting a box from the freelist can assume success since this comes just after a `\clearpage`.

```

209 \long\def \@topnewpage [#1]{%
210   \@nodocument
211   \@next\@currbox\@freelist{}{}%
212   \global \setbox\@currbox
213     \color@vbox
214       \normalcolor
215       \vbox{%
216         \hsize\textwidth
217         \parboxrestore
218         \col@number \@ne
219         #1%
220         \vskip -\dbltextfloatsep
221       }%
222     \color@endbox

```

Added size test and warning message; perhaps we should use an error message.

```

223   \ifdim \ht\@currbox>\textheight
224     \ht\@currbox \textheight
225   \fi

```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from `\@addtobblcol`, plus some extra checks for error trapping.

```

226   \global \count\@currbox \tw@
227   \tempdima -\ht\@currbox
228   \advance \tempdima -\dbltextfloatsep
229   \global \advance \colht \tempdima
230   \ifx \dbltoplist \empty
231   \else
232     \@latex@error{Float(s) lost}\ehb
233     \let \dbltoplist \empty
234   \fi
235   \cons \dbltoplist \@currbox

```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```

236   \global \@dbltopnum \m@ne
237   {*trace}
238     \f@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
239   //trace)

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be $3\baselineskip$, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```
240 \ifdim \@colht<2.5\baselineskip
241   \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
242     too tall on page \thepage}%
243   \emptycol
244   \if@firstcolumn
245   \else
246     \emptycol
247   \fi
248 \else
249   \global \vsize \@colht
250   \global \@colroom \@colht
251   \floatplacement
252 \fi
253 }
```

(End of definition for `\twocolumn` and `\@topnewpage`.)

2 The L^AT_EX output routine

2.1 Hooks and replaceable code blocks

To support packages that want to augment aspects of the output routine we offer a number of hooks (where several packages can add code) as well as some sockets (that can only be changed by one package or through options like those of the `footmisc` package).

2.1.1 Output routine hooks

build/page/before, build/page/after These two hooks enable packages to prepend or append code to the page processing in the output routine. They are implemented as mirrored hooks.

Technically, they are executed at the start and the end of the internal L^AT_EX 2 ε `\@outputpage` command, respectively.

build/page/reset Packages that set up special conventions for text in the main galley (such as catcode changes, etc.) can use this hook to undo these changes within the output routine, so that they aren’t applied to unrelated material, e.g., the text for running header or footers.

build/column/before, build/column/after These two hooks enable packages to prepend or append code to the column processing in the output routine. They are implemented as mirrored hooks.

Technically, they are executed at the start and the end of the internal L^AT_EX 2 ε `\@makecol` command, respectively.

2.1.2 Replaceable code blocks (sockets)

To cater for different layouts with respect to text, footnotes, and bottom-floats placements there are sockets for now. They are sockets not hooks, because the overall layout can only be controlled by one package, i.e., the last setting wins.

build/column/outputbox (0 arguments) In code for this socket the `\@outputbox` (holding the galley text for the current column or page) is augmented by attaching floats and footnote areas together with appropriate spacing.

Prior to calling the socket the output routine has already decided which floats go into which area and which get deferred. Therefore, the assumption is that the code in the socket attaches all areas that contain floats. If this is not done, then the order of floats is likely to be screwed up unless unused floats are moved to the defer list in an appropriate way (for now we don't offer any interface for that scenario).

Before the code in the socket is run, any existing glue at the bottom of the `\@outputbox` is removed and stored in a safe place. If needed, it can be reinserted with one of the helper commands.

To support setting this up the following helper commands are available:

\@outputbox@append (1 argument)

This general purpose command alters the `\@outputbox` box by appending material to it.

\@outputbox@appendfootnotes (0 arguments)

This command appends the footnotes to the `\@outputbox` (if there are any). If not, then it does nothing.

\@outputbox@attachfloats (0 arguments)

\@outputbox@attachtopfloats (0 arguments)

\@outputbox@attachbottomfloats (0 arguments)

Attaching top and bottom floats can usually be done in one go, but for special layouts we might want more control so we provide also separate commands.

\@outputbox@reinsertbskip (0 arguments)

Reinsert the bottom skip of the `\@outputbox` that was saved before in `\@makecol`.

Testing for existence of material

There are a number of helpers to run conditional code depending on whether or not there are footnotes or bottom floats. They are `\@if@footnotes@TF` and `\@if@bottomfloats@TF` (names are likely to change).

This socket cannot be empty but needs appropriate code; a set of suitable plugs for it are already given in the kernel. These are

space-footnotes-floats After the galley text there is a vertical `\vfill` followed by any footnotes followed by the bottom floats, if any.

footnotes-space-floats As before but the `\vfill` is between footnotes and floats.

floats-space-footnotes Floats are directly after the text, then a space and then footnotes at the bottom.

space-floats-footnotes Both floats and footnotes are pushed to the bottom with footnotes last.⁶²

floats-footnotes All excess space is distributed across the existing glue on the page, e.g., within the text galley, the separation between blocks, etc. The order is text, floats, footnotes.

footnotes-floats As the previous one but floats and footnotes are swapped. This is the L^AT_EX default for newer document, i.e., this plug is assigned to the socket when \DocumentMetadata is used.

footnotes-floats-legacy As the previous one but L^AT_EX's bottom skip bug is not corrected, i.e., in ragged bottom designs where footnotes are supposed to be directly attached to the text, they suddenly appear at the bottom of the page when the page is ended with \newpage or \clearpage. While this is clearly a bug, it was the case since the days of L^AT_EX 2.09; thus for compatibility we continue to support this behavior.

build/column/footnotes (0 arguments) This socket is used to manipulate the footnote material inside \box\footins. If it contains code, it is supposed to do some processing of that box and then write the result back into it (and nothing else!). By default it does nothing, i.e., has the **noop** assigned.

If (short) footnotes are run as a paragraph this socket gets the plug **para** assigned which is defined elsewhere.

2.1.3 Tagging sockets

The following sockets are used to implement tagging. They are used via \UseTaggingSocket which turns them off when tagging is disabled. For each of them a **default** plug is implemented that holds the tagging code.

build/column/outputbox (0 arguments) This socket is used to add any missing tagging structures to the \outputbox box, if necessary.

build/column/footins (0 arguments) This socket is used to add any missing tagging structures to \footins box, if necessary.

build/page/header (2 arguments) This socket receives the content of the formatted page header as its second argument and adds the necessary tagging around it. The first argument is empty as no special setup is necessary.

build/page/footer (2 arguments) This socket receives the content of the formatted page footer as its second argument and adds the necessary tagging around it. The first argument is empty as no special setup is necessary.

2.1.4 Output routine commands

\output This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

⁶²There are two more permutations, but neither of them has ever been requested so they aren't set up by default — doing that in a class would be trivial though.

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

254 \output {%
255   \let \par \@@par
256   \ifnum \outputpenalty<-\@M
257     \specialoutput
258   \else
259     \makecol
260   \opcol
261 }

```

Moved to `\opcol`: `\floatplacement`.

This loop could be replaced by an `\expandafter` tail recursion in `\startcolumn`.

```

262   \whilesw \if@fcolmade \fi
263   {%
264     <*trace>
265       \fl@trace{PAGE: float \if@twocolumn column \else page \fi
266                   completed}%
267   </trace>
268   \opcol\startcolumn}%
269   \fi
270   \ifnum \outputpenalty>-\@Miv

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\emptycol` will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.

```

271   \ifdim \colroom<1.5\baselineskip
272     \ifdim \colroom<\textheight
273       \@latex@warning@no@line {Text page \thepage\space
274                               contains only floats}%
275     \emptycol
276   %
277   \if@twocolumn
278   %
279   \else
280   %
281   \fi
282   %
283   \global \vsize \colroom

```

```

284      \fi
285      \else
286          \global \vsize \@colroom
287      \fi
288  \else
289      \global \vsize \maxdimen
290  \fi
291 }

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CHANGES TO \@specialoutput:

* \penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments.

(Changed 23 Oct 86)

* Definition of \@specialoutput changed 26 Feb 88 so \@pageht and \@pagedp aren't changed for a marginal note.

(Change suggested by Chris Rowley.)

End of historical L^AT_EX 2.09 comments.

```

292 \gdef\@specialoutput{%
293   \ifnum \outputpenalty>-\@Mii
294     \@doclearpage
295   \else
296     \ifnum \outputpenalty<-\@Mii
297       \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
298       \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
299   \else

```

Note that \boxmaxdepth should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore \@holdpg should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: \setbox\@tempboxa \box \@cclv.

The last box which is removed is the box put there by the double-penalty mechanism. The \unskip then removes the \topskip which is put there since the box is the first on the page.

```

300   \global \setbox\@holdpg \vbox{%
301     \unvbox\@holdpg
302     \unvbox\@cclv

```

We must now remove the box added by the float mechanism and the \topskip glue therefore added above it by T_EX.

```

303           \setbox\@tempboxa \lastbox
304           \unskip
305         }%

```

These two are needed as separate dimensions only by \addmarginpar; for other purposes we put the whole size into \@pageht (see below).

```

306           \@pagedp \dp\@holdpg
307           \@pageht \ht\@holdpg

```

```

308      \unvbox \choldpg
309      \cnext\currbox\currlist{%
310          \ifnum \count\currbox>\z@
```

Putting the whole size into \pageht (see above).

```

311          \advance \pageht \pagedp
312          \ifvoid\footins \else
313              \advance \pageht \ht\footins
314              \advance \pageht \skip\footins
315              \advance \pageht \dp\footins
316          \fi
317          \ifvbox \kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The *-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```

318          \ifdim \wd\kludgeins=\z@
319              \advance \pageht \ht\kludgeins
320          <*trace>
321              \f@trace {Extra size added: \the \ht\kludgeins}%
322          </trace>
323          \fi
324          \fi
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```

325          \reinserts
326          \addtocurcol
327      \else
328          \reinserts
329          \addmarginpar
330      \fi
331  } \@latexbug
```

A 2e change: use \addpenalty instead of \penalty here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a \nobreak must be correct.

```

332          \ifnum \outputpenalty<\z@
333              \if@nobreak
334                  \nobreak
335              \else
336                  \addpenalty \interlinepenalty
337              \fi
338          \fi
339      \fi
340  \fi
341 }
342 </2ekernel | ftrace>
```

(End of definition for \output and \specialoutput.)

\@testwrongwidth \f@depth Test if the float box has the wrong width when trying to place it into some area. (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

```

343 <latexrelease>\IncludeInRelease{2015/01/01}%
344 <latexrelease> {\@testwrongwidth}{float order in 2-column}%
345 <2ekernel | latexrelease | fltrace>

346 \def\@testwrongwidth #1{%

368 <latexrelease>\EndIncludeInRelease

```

(End of definition for \@testwrongwidth and \f@depth.)

\@doclearpage This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test \@testwrongwidth{\box} at suitable places. That is at places where a box is taken off the deferlist.

```

\@opcol Several changes in detail here.

```

463 <*2ekernel | fltrace>
464 \def \@opcol {%
465   \if@twocolumn

```

The funny-looking internal commands are interfacing with the new marks mechanism. We make sure (elsewhere) that those are always defined, even when we roll back, so here we add them unconditionally. This still need turning into a hook or config point eventually:

```

466 \@expl@@@mark@update@dblcol@structures@@

```

```

467      \@outputdblcol
468  \else
469      \@expl@@@mark@update@singleref@structures@@
470      \@outputpage
471  {*trace}
472      \f1@trace{PAGE: one column (float? see above) page completed}%
473  
```

Not needed since it comes after \@outputpage:

```

474 %   \global\@colht\textheight
475 \fi

```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

476 \global \z@ \global \textfloatsheight \z@
477 \floatplacement
478 }
479 
```

(End of definition for \@opcol.)

```

480 {*2ekernel | latexrelease}
481 \IncludeInRelease{2025/06/01}%
482 \latexrelease{}{\@makecol}{\@makecol adding hooks/sockets}%

```

\@makecol \@makecol is shortened a lot, basically all the hardwired code in the middle has moved into a socket.

```

483 \def \@makecol {%

```

A number of packages want to prepend code to \@makecol; this is the hook for that:

```

484 \UseHook {build/column/before}%

```

Save away box 255 as \@outputbox to make it available for further adjustments.

```

485 \setbox\@outputbox \box\@cclv

```

The only real addition is the next command which either does nothing or removes an infinite glue from the bottom of the \@outputbox.

```

486 \@outputbox@removebskip

```

Now a kernel hook for tagging that adjusts the content of \@outputbox, if necessary. At this point it just contains the material from the galley.

```

487 \UseTaggingSocket{build/column/outputbox}%

```

When this code is run any “here” floats in the \@outputbox are already handled, so we recycle their registers and put them back to the \@freelist.

```

488 \let\@elt\relax
489 \xdef\@freelist{\@freelist\@midlist}%
490 \global \let \@midlist \empty

```

Here we have the configurable part. This socket is supposed to add floats, footnotes and stretchable vertical space as appropriate to the \@outputbox. It is used by packages such as `footmisc` to implement different layout, e.g., footnotes above or below bottom floats, etc.

```

491 \UseSocket {build/column/outputbox}%

```

Then we deal with any `\enlargethispage` or run the normal code to build a column.

```
492 \ifvbox\@kludgeins  
493     \@make@specialcolbox  
494 \else  
495     \@make@normalcolbox  
496 \fi  
497 \global \maxdepth \@maxdepth
```

Finally, another hook for external packages or classes that want to augment or alter the output routine by appending to `\@makecol`.

```
498 \UseHook {build/column/after} %  
499 }
```

(End of definition for `\@makecol`.)

`\@outputbox@depth` We need to know the depth of `\@outputbox` once in a while. Rather than using a temp dimen (as it was done in the past), we give it a proper register.

```
500 \newdimen\@outputbox@depth
```

(End of definition for `\@outputbox@depth`.)

`\@make@normalcolbox` Taken out of `\@makecol` for readability.

```
501 \def \@make@normalcolbox {%
```

```
502     \setbox\@outputbox \vbox to\@colht {%
```

```
503         \texttop
```

```
504         \outputbox@depth \dp\outputbox
```

```
505     \unvbox \outputbox
```

The `\vskip -\@outputbox@depth` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

```
506     \vskip -\@outputbox@depth  
507     \textbottom  
508 }%  
509 }
```

(End of definition for `\@make@normalcolbox`.)

`\@make@specialcolbox` Make the colbox when `\enlargethispage` was used.

```
510 </2ekernel | latexrelease>  
511 <*2ekernel | latexrelease | fltrace>  
512 \def \@make@specialcolbox {%
```

```
513 <*trace>
```

```
514     \fl@trace{Kludgeins ht \the\ht\@kludgeins\space  
515                 dp \the\dp\@kludgeins\space  
516                 wd \the\wd\@kludgeins} %
```

```
517 </trace>
```

```
518     \outputbox@append {\vskip-\@outputbox@depth} %  
519     \tempdima \@colht
```

```
520     \ifdim \wd\@kludgeins>\z@
```

Note that in this case (the `*`-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the TeX level!).

This needs TeX3 otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

There should perhaps be an upper limit, of `0pt?`, on the extra space added to force shrinking.

```

521      \advance \@tempdima -\ht\@outputbox
522      \advance \@tempdima \pageshrink
523  {*trace}
524      \f@trace {Natural ht of col: \the \ht\@outputbox}%
525      \f@trace {\string \@colht: \the \@colht}%
526      \f@trace {Pageshrink added: \the \pageshrink}%
527      \f@trace {Hence, space added: \the \@tempdima}%
528  {/trace}
529      \setbox\@outputbox \vbox to \@colht {%
530          \unvbox\@outputbox
531          \vskip \@tempdima
532          \textbottom
533      }%

```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

534  \else
535      \advance \@tempdima -\ht\@kludgeins
536  {*trace}
537      \f@trace {Natural ht of col: \the \ht\@outputbox}%
538      \f@trace {\string \@colht: \the \@colht}%
539      \f@trace {Extra size added: -\the \ht \@kludgeins}%
540      \f@trace {Hence, height of inner box: \the \@tempdima}%
541      \f@trace {Max? pageshrink available: \the \pageshrink}%
542  {/trace}

```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

543      \setbox \@outputbox \vbox to \@colht {%
544          \vbox to \@tempdima {%
545              \unvbox\@outputbox
546          \textbottom}%

```

```

547     \vss}%
548     \fi
549     {\setbox \tempboxa \box \kludgeins}%
550   {*trace}
551     \f@trace {kludgeins box made void}%
552   {/trace}
553 }
554 {/2ekernel | latexrelease | fltrace}
555 {*}2ekernel | latexrelease)

```

(End of definition for \make@specialcolbox.)

\@outputbox@removebskip This is really a bug fix for the kernel (from the 2.09 days) but one we only make by default in new documents that are using \DocumentMetadata. If \raggedbottom is in force, footnotes get attached to the main galley at a distance of \footskip on all pages except on those that are ended by \newpage or \clearpage where the \vfil from \newpage pushes the footnotes to the very bottom.

This is kind of a weird difference to a page ending with \pagebreak—in that case the page is also run short, but the footnotes are not pushed to the bottom.

In footmisc \@outputbox@removebskip is only applied when footmisc is called with an option specifying the footnote placement, i.e., not in the default case. In new documents we apply it always.

```
556 \def\@outputbox@removebskip{%
```

We first test if we are in a \raggedbottom layout. If not we do nothing, but we don't disable the code because \raggedbottom may get used only for some parts of the document.

```
557 \ifx\@textbottom\relax \else
```

In some special circumstances the \@outputbox might be void. As \@outputbox@append below would change this, we better handle this case and leave it unchanged in this situation, because otherwise we can't detect that situation any longer (needed, for example, in ftnright).

```

558 \ifvoid \@outputbox
559   \global\let\@outputbox@reinsertbskip\relax
560 \else
```

If not, we drop the final skip at the end of \@outputbox provided there is one and it has a glue stretch order of 1 or more (i.e., contains a fil or fill part).

```

561   \@outputbox@append{%
562     \tempskipa\lastskip
563     \ifnum \gluestretchorder\tempskipa>\z@
564       \unskip
```

We also record the value so that it can be reinserted elsewhere. As we have to do this globally, we also need to explicitly reset it if we don't find any such glue.

```

565   \xdef\@outputbox@reinsertbskip
566     {\noexpand\@outputbox@append{\vskip\the\tempskipa}}%
567   \else
568     \global\let\@outputbox@reinsertbskip\relax
569   \fi
570 }
571 \fi
572 \fi
573 }
```

We need a trivial top-level definition for `\@outputbox@reinsertbskip` in case the first page has no bottom glue and the command gets called.

```
574 \let \@outputbox@reinsertbskip \relax
```

(End of definition for `\@outputbox@removebskip` and `\@outputbox@reinsertbskip`.)

2.2 The output routine configuration components

Here we provide the commands that are used to define code for the socket `build/column/outputbox`. They all manipulate the `\@outputbox` box in one way or another.

- `\@outputbox@append` This general purpose command alters the `\@outputbox` box by appending material to it. As this is a box typesetting operation we make sure that the last line of the box reflects the true depth of the last line (in case that is needed later). We also expose the current depth of `\@outputbox` as `\@outputbox@depth` before unboxing so that its value can be used by #1 if wanted.

```
575 \def\@outputbox@append #1{%
576   \setbox\@outputbox \vbox {%
```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```
577   \boxmaxdepth \@maxdepth
578   \@outputbox@depth\dp\@outputbox      % if needed in #1
579   \unvbox \@outputbox
580   #1%
581 }%
582 }
```

(End of definition for `\@outputbox@append`.)

- `\@outputbox@appendfootnotes` This command appends the footnotes to the `\@outputbox` (if there are any). If not, then it does nothing.

```
583 \def\@outputbox@appendfootnotes {%
584   \ifvoid\footins \else
```

Handling split footnotes need further work so this is for the moment just a dummy that does nothing. It might vanish and get replaced by a socket eventually.

```
585   \makecol@handlesplitfootnotes
```

The following socket can be used to manipulate the material in `\footins` box, for example, if the footnotes are to be presented all together in a single paragraph. By default it does nothing.

```
586   \UseSocket{build/column/footnotes}%
```

Then the footnotes are appended:

```
587   \@outputbox@append{%
588     \vskip \skip\footins
```

This is socket adjusts the tagging of the `\footins` box, if necessary.

```
589   \UseTaggingSocket{build/column/footins}%
590   \color@begingroup
591     \normalcolor
592     \footnoterule
```

Support for `pdfcolfoot`, eventually this can go once color is properly supported. The csname is constructed in case the command is not defined, i.e., the package not loaded.

```

593     \csname pdfcolfoot@current\endcsname
594     \unvbox \footins
595     \color@endgroup
596   }%
597 \fi
598 }
```

(End of definition for \@outputbox@appendfootnotes.)

`\@makecol@handlesplitfootnotes` For future extensions ...

```
599 \let \@makecol@handlesplitfootnotes \empty
```

(End of definition for \@makecol@handlesplitfootnotes.)

`\@outputbox@attachfloats` `\@outputbox@attachtopfloats` `\@outputbox@attachbottomfloats` Attaching top and bottom floats can usually be done in one go, but for special layouts we might want more control so we provide also separate commands.

The next command was called `\@combinefloats` in the past.

```

600 \def \@outputbox@attachfloats {%
601   \ifx \@toplist\empty \else \@cflt \fi
602   \ifx \@botlist\empty \else \@cflb \fi
603 }
604 \def \@outputbox@attachtopfloats {%
605   \ifx \@toplist\empty \else \@cflt \fi
606 }
607 \def \@outputbox@attachbottomfloats {%
608   \ifx \@botlist\empty \else \@cflb \fi
609 }
```

(End of definition for \@outputbox@attachfloats, \@outputbox@attachtopfloats, and \@outputbox@attachbottomfloats.)

The next three conditionals might be useful when setting up running headers and footers so perhaps they should be change to CamelCase names. For now they are internal.

`\@if@flushbottom@TF` Test for `\flushbottom` (currently not used).

```

610 \def\@if@flushbottom@TF{%
611   \ifx\@textbottom\relax
612     \expandafter\@firstoftwo
613   \else
614     \expandafter\@secondoftwo
615   \fi
616 }
```

(End of definition for \@if@flushbottom@TF.)

`\@if@footnotes@TF` Test if footnotes are present on the current page.

```

617 \def\@if@footnotes@TF{%
618   \ifvoid\footins
619     \expandafter\@secondoftwo
620   \else
621     \expandafter\@firstoftwo
622   \fi
623 }
```

(End of definition for \@if@footnotes@TF.)

\@if@bottomfloats@TF Test if bottom floats are around.

```
624 \@def\@if@bottomfloats@TF{%
625   \ifx \@botlist\@empty
626     \expandafter\@secondoftwo
627   \else
628     \expandafter\@firstoftwo
629   \fi
630 }
```

(End of definition for \@if@bottomfloats@TF.)

2.2.1 Configuration sockets

build/column/outputbox (*socket*) We have one socket that is supposed to augment the \outputbox by attaching floats and footnotes with appropriate spacing.

```
631 \NewSocket{build/column/outputbox}{0}
```

The following plugs are available for this socket:

space-footnotes-floats (*plug*) After the galley text there is a vertical \vfill followed by any footnotes followed by the bottom floats, if any.

```
632 \NewSocketPlug {build/column/outputbox}{space-footnotes-floats} {%
633   \@if@footnotes@TF
634     {\@outputbox@append{\vfill}}%
635   \{@if@bottomfloats@TF
636     {\@outputbox@append{\vfill}}%
637     {\@outputbox@reinsertbskip}%
638   }%
639   \@outputbox@appendfootnotes
640   \@outputbox@attachfloats
641 }
```

footnotes-space-floats (*plug*) As before but the \vfill is between footnotes and floats.

```
642 \NewSocketPlug {build/column/outputbox}{footnotes-space-floats} {%
643   \@outputbox@appendfootnotes
644   \@if@bottomfloats@TF
645     {\@outputbox@append{\vfill}}%
646     {\@outputbox@reinsertbskip}%
647   \@outputbox@attachfloats
648 }
```

floats-space-footnotes (*plug*) Floats immediately after the galley text and footnotes at the bottom.

```
649 \NewSocketPlug {build/column/outputbox}{floats-space-footnotes} {%
650   \@outputbox@attachfloats
651   \@if@footnotes@TF
652     {\@outputbox@append{\vfill}}%
653     {\@outputbox@reinsertbskip}%
654   \@outputbox@appendfootnotes
655 }
```

space-floats-footnotes (*plug*) Both floats and footnotes are pushed to the bottom with footnotes last.⁶³

```
656 \NewSocketPlug {build/column/outputbox}{space-floats-footnotes} {%
657   \@if@footnotes@TF
658     {\@outputbox@append{\vfill}}%
659     {\@if@bottomfloats@TF
660       {\@outputbox@append{\vfill}}%
661       {\@outputbox@reinsertbskip}}%
662   \@outputbox@attachfloats
663   \@outputbox@appendfootnotes
664 }
```

floats-footnotes (*plug*) All excess space has to be distributed across the existing glue on the page, e.g., within the text galley, the separation between blocks, etc. The order is text, floats, footnotes.

```
665 \NewSocketPlug {build/column/outputbox}{floats-footnotes} {%
666   \@outputbox@attachfloats
667   \@outputbox@appendfootnotes
```

We do reinsert the bottom skip from `\newpage` if it was taken out earlier. This is, strictly speaking, not necessary in most cases, but it is a `\vfil` while `\raggedbottom` is only generating `\vspace{0pt plus .0001fil}`, so if you have several `\vfil` on the page before the `\newpage` you would alter the space distribution if one is taken out.

```
668   \@outputbox@reinsertbskip
669 }
```

footnotes-floats (*plug*)

```
670 \NewSocketPlug {build/column/outputbox}{footnotes-floats} {%
671   \@outputbox@appendfootnotes
672   \@outputbox@attachfloats
673   \@outputbox@reinsertbskip
674 }
```

The **footnote-floats** plug implements the layout used by L^AT_EX but with the bottom skip bug corrected. This will be the default when `\DocumentMetadata` is used; it can be overwritten either through `footmisc` or by assigning any of the other plugs (or by coding yet another plug for the socket).

footnotes-floats-legacy (*plug*) This implements the 2.09 layout (including its bottom skip bug).

```
675 \NewSocketPlug {build/column/outputbox}{footnotes-floats-legacy} {%
```

In the legacy case we don't really want to take out the bottom skip, but rather then altering `\@outputbox@removebskip` in `\makecol` to do nothing, which we would then have to undo in each other layout, we simply reinsert the dropped skip immediately again.

```
676   \@outputbox@reinsertbskip
677   \@outputbox@appendfootnotes
678   \@outputbox@attachfloats
679 }
```

The **footnote-floats-legacy** plug is the default used by L^AT_EX when `\DocumentMetadata` is not used; it can be overwritten either through `footmisc` or by assigning any of the other plugs (or by coding yet another plug for the socket).

```
680 \AssignSocketPlug {build/column/outputbox}{footnotes-floats-legacy}
```

⁶³There are two more permutations, but neither of them has ever been requested so they aren't set up by default — doing that in a class would be trivial though.

`build/column/footnotes (socket)` The socket allowing the manipulation of `\footins` box (result needs to be moved back in there). Used when footnotes are reformatted into a single paragraph by the `para` option of `footmisc`. By default it does nothing.

```
681 \NewSocket{build/column/footnotes}{0}
```

`build/page/before (hook)` Hooks at the start and end of `\@outputpage` for use by packages.

```
682 \NewMirroredHookPair{build/page/before}{build/page/after}
```

`build/page/reset (hook)` Hook in `\@outputpage` to reset special galley conventions within the output routine.

```
683 \NewHook {build/page/reset}
```

`build/column/before (hook)` Hooks at the start and end of `\@makecol` for use by packages.

```
684 \NewMirroredHookPair{build/column/before}{build/column/after}
```

```

(End of definition for \resetactivechars and \@activechar@info.)

\outputpage \shipoutsetup \writesetup

The \color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \aftergroup. This is because it must have the value \relax before macros coming from other uses of \aftergroup within this box are expanded.

Putting this into the \aftergroup token list does not affect the definition used in expanding the \writes because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an \aftergroup within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```

789 </2ekernel>
790 <texrelease>\IncludeInRelease{2025/06/01}%
791 <texrelease> {\@outputpage}{Use new mark mechanism}%
792 {*2ekernel | texrelease}
  
```

Temp definition to vanish again when something is offered by the backend:

```
793 \protected \def \pdfannot@link@on@@ { \csname pdfannot_link_on:\endcsname }
794 \protected \def \pdfannot@link@off@@ { \csname pdfannot_link_off:\endcsname }
795 \def \@outputpage {%
```

We start with a hook available to packages that want to prepend code to `\@outputpage`.

```
796 \UseHook {build/page/before} %
```

The `\endgroup` is put in by `\aftergroup`.

```
797 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here on was originally in the command `\@writesetup`.

The following definition of `\protect` is the one active during the `\write` statement that migrate out of the `\shipout` box, so even though it is immediately changed below (inside `\shipout` it still has to be here!)

```
798 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a pagebreak in `verbatim` does not prevent hyphenation in the page head.

```
799 \language\document@default@\language
```

The `\catcode`\\ = 10` was removed as it was considered useless (presumably because nothing gets tokenized during `shipout`).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
800 \resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
801 \global\let\@if@newlist\if@newlist
802 \global\@newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischyp
\let'\`@acci\let`\^@accii\let`\= @acciii
\let\\@normalcr
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normalineskip
\baselineskip\normalbaselineskip
\sloppy
```

```
803  \c@parboxrestore
```

... to here was in the command \c@writesetup.

Hook to allow adding resets local to the output routine processing, e.g., in \write or running headers/footers, for packages that set up special conventions in the main galley that should not leak into the page production just because a page break happens in the middle of such an environment.

```
804  \UseHook {build/page/reset}%
805  \shipout \vbox{%
```

Inside the \shipout box we have a different setting for \protect.

```
806  \set@typeset@protect
807  \aftergroup \endgroup
```

Once the \shipout boxes ends \protect is again \noexpand which is correct for any \write statements, but once they are processed we want to get back to the following setting:

```
808  \aftergroup \set@typeset@protect
```

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \c@shipoutsetup.

```
809  \if@specialpage
810    \global \c@specialpagefalse
811    \c@nameuse {ps@\c@specialstyle}%
812  \fi
813  \if@twoside
814    \ifodd\count\z@
815      \let \c@thehead \c@oddhead
816      \let \c@tfoot \c@oddfoot
817      \let \c@themargin \c@oddsidemargin
818  \else
819    \let \c@thehead \c@evenhead
820    \let \c@tfoot \c@evenfoot
821    \let \c@themargin \c@evensidemargin
822  \fi
823  \fi
```

The rest was always inside the box.

RmS 91/08/15: added this line:

```
824  \reset@font
```

RmS 93/08/06 Added \lineskiplimit=0pt to guard against it being nonzero: e.g. by \offinterlineskip being in effect.

There are probably lots of other things that may need resetting.

```
825  \normalsize
```

Reset the space factors.

```
826  \normalsfcodes
```

Reset these here (previously reset separately for head and foot)

```
827  \let \label \c@gobble@with@cphack@om

```

(End of definition for `\@outputpage`, `\@shipoutsetup`, and `\@writesetup`.)

`\@begindvi` This unboxes stuff that must appear before anything else in the .dvi file, then returns that box register to the free list and cancels itself.

The stuff in the box should not add any typeset material to the page.

```

988 \def \@begindvi{%
989   \unvbox \@begindvibox
990   \global\let \@begindvi \empty
991 }

```

(End of definition for `\@begindvi`.)

2.2.2 Dealing with floats

`\@combinefloats` Old name for what is now called `\@outputbox@attachfloats`; kept to support legacy packages.

```
992 \let \@combinefloats \@outputbox@attachfloats
```

(End of definition for `\@combinefloats`.)

`\@cflt` The `\boxmaxdepth` setting here was not made local to a box so was dangerous. It is
`\@cflb` needed only within the box made by `\@cflt` (and not normally even there), so it has been moved there; this also agrees with the original pseudocode.

```

993 \def \@cflt{%
994   \let \@elt \@comflelt
995   \setbox\@tempboxa \vbox{}%
996   \@toplist
997   \setbox\@outputbox \vbox{%
998     \boxmaxdepth \maxdepth
999     \unvbox\@tempboxa
1000     \vskip -\floatsep
1001     \topfigrule
1002     \vskip \textfloatsep
1003     \unvbox\@outputbox
1004   }%
1005   \let\@elt\relax
1006   \xdef\@freelist{\@freelist\@toplist}%
1007   \global\let\@toplist\empty
1008 }

```

```

1037     \setbox\@outputbox \vbox to\textheight

```

The setting of \boxmaxdepth here has no effect since the \@outputbox should already have depth zero. Even so, it would have no effect on the layout of the page.

```

1038   \boxmaxdepth\maxdepth %% probably not needed, CAR
1039   \unvbox\@tempboxa\vskip-\dblfloatsep

```

Here we need different typesetting if the top float comes from \@topnewpage.

```

1040 \ifnum \@dbltopnum>\m@ne
1041   \dblfigrule
1042 \fi
1043 \vskip \dbltextfloatsep

```

If pdf links are present in the galley and those links get broken across pages they have to end up being on the same level of boxing (even if not actually in the same structure) due to some engine restrictions in pdftEX and LuaTeX. We therefore unbox \@outputbox here (which only contains a single \hbox) so that this case has the same boxing level as a normal twocolumn page without top floats.

```

1044   \unvbox\@outputbox
1045   }%
1046 \fi
1047 }
1048 </2ekernel>

```

(End of definition for \@comflelt, \@comdblflelt, and \@combinedblfloats.)

\@startcolumn We could combine (most of) these two into \@startcol <list>. Note that \@xstartcol was only used once (i.e. in \@startcolumn); it has therefore been removed. This is not quite as efficient but it now has the same structure as \@startdblcolumn.

The empty-list test has been moved to \@tryfcolumn.

```

1358     \else
1359         \@fsettextmin

```

This is a new adjustment which is quite a major change in functionality; but it implements the documentation. Note that \reqcolroom will include the whole of the

page-so-far, and hence includes `\@textfloatsheight` of floats, so before comparing it with `\@textmin`, we add this to `\@textmin` also.

```

1360  {*trace}
1361      \fl@trace{textfloatsheight (before) = \the \@textfloatsheight}%
1362  {/trace}
1363      \advance \@textmin \@textfloatsheight
1364      \reqcolroom \@pageht

```

This line must be removed since `\@specialoutput` changed.

```

1365  %
1366  {*trace}

```

CHANGE TO \addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1423           \if@nobreak
1424               \nobreak
1425               \nobreakfalse

1654 </trace>
1655 <{latexrelease | fltrace | flafter> \else
1656 <{latexrelease | fltrace | flafter> \@flsettextmin

```

This is a new adjustment which is quite a major change in functionality; but it implements the documentation. Note that \reqcolroom will include the whole of the page-so-far, and hence includes \textfloatsheight of floats, so before comparing it with \textmin, we add this to \textmin also.

```

1657 <{*trace>
1658 <{latexrelease | fltrace | flafter> \fl@trace{textfloatsheight (before) =
1659 <{latexrelease | fltrace | flafter> \the \@textfloatsheight}%
1660 </trace>
1661 <{latexrelease | fltrace | flafter> \advance \@textmin \@textfloatsheight
1662 <{latexrelease | fltrace | flafter> \reqcolroom \pageht

```

This line must be removed since \specialoutput changed.

```

```

CHANGE TO \addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1733 <{latexrelease | fltrace | flafter}>          \if@nobreak
1734 <{latexrelease | fltrace | flafter}>          \nobreak
1735 <{latexrelease | fltrace | flafter}>          \@nobreakfalse
1736 <{latexrelease | fltrace | flafter}>          \everypar{}%
1737 <{latexrelease | fltrace | flafter}>          \else
```

```

1738 <{latexrelease | fltrace | flafter}>           \addpenalty\interlinepenalty
1739 <{latexrelease | fltrace | flafter}>           \fi
1740 <{latexrelease | fltrace | flafter}>           \vskip \intextsep
1741 <{latexrelease | fltrace | flafter}>           \box@\currbox
1742 <{latexrelease | fltrace | flafter}>           \penalty\interlinepenalty
1743 <{latexrelease | fltrace | flafter}>           \vskip\intextsep
1744 <{latexrelease | fltrace | flafter}>           \ifnum\outputpenalty
1745 <{latexrelease | fltrace | flafter}>           <- \@Mi \vskip
1746 <{latexrelease | fltrace | flafter}>           -\parskip\fi

```

Typesetting ends here.

```

1747 <{latexrelease | fltrace | flafter}>           \outputpenalty \z@ \cinserttrue
1748 <{latexrelease | fltrace | flafter}>

1757 <{latexrelease | fltrace | flafter}>           \else

```

Next set of docstrip guards are a bit weird, essentially `\@addtotoporbot` ends up inside the kernel and the `fltrace` package and `\@addtotoporbot` shows up in the `flafter` package. Guess that could have been done a bit more obvious :-)

\\@addmarginpar
2311  {*2ekernel}
2312  \\def\\@addmarginpar{\\next\\@marbox\\@currlist{\\@cons\\@freelist\\@marbox
2313    \\@cons\\@freelist\\@currbox}\\@latexbug\\@tempcnta\\one
2314    \\if@twocolumn
2315      \\if@firstcolumn \\@tempcnta\\m@ne \\fi
2316    \\else
2317      \\if@mparswitch
2318        \\ifodd\\c@page \\else\\@tempcnta\\m@ne \\fi
2319      \\fi
2320      \\if@reversemargin \\@tempcnta -\\@tempcnta \\fi
2321    \\fi
2322    \\ifnum\\@tempcnta <\\z@ \\global\\setbox\\@marbox\\box\\@currbox \\fi
2323    \\@tempdima\\@mparbottom
2324    \\advance\\@tempdima -\\@pageht
2325    \\advance\\@tempdima\\ht\\@marbox
2326    \\ifdim\\@tempdima >\\z@
2327      \\@latex@warning@no@line {Marginpar on page \\thepage\\space moved}\\%
2328    \\else
2329      \\@tempdima\\z@
2330    \\fi
2331    \\global\\@mparbottom\\@pageht
2332    \\global\\advance\\@mparbottom\\@tempdima
2333    \\global\\advance\\@mparbottom\\dp\\@marbox
2334    \\global\\advance\\@mparbottom\\marginparpush
2335    \\advance\\@tempdima -\\ht\\@marbox

```

Putting box movement inside the ‘marbox’:

```

2336  \\global\\setbox \\@marbox
2337    \\vbox {\\vskip \\@tempdima
2338      \\box \\@marbox}\\}%
2339  \\global\\ht\\@marbox \\z@
2340  \\global\\dp\\@marbox \\z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

2341  \\kern -\\@pagedp
2342  \\nointerlineskip
2343  \\hb@xt@\\columnwidth
2344    {\\ifnum \\@tempcnta >\\z@
2345      \\hskip\\columnwidth \\hskip\\marginparsep
2346    \\else
2347      \\hskip -\\marginparsep \\hskip -\\marginparwidth
2348    \\fi
2349    \\box\\@marbox \\hss}\\}%

```

For this reason the following code can vanish:

```

\\nobreak \\% No longer needed. CAR92/12
\\vskip -\\@tempdima \\% No longer needed. CAR92/12
2350  \\nointerlineskip
2351  \\hbox{\\vrule \\@height\\z@ \\@width\\z@ \\@depth\\@pagedp}}%

```

(End of definition for \@addmarginpar.)

2.2.3 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX2e.

```
\enlargethispage{<dim>}
```

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

```
\enlargethispage*{<dim>}
```

Similar to \enlargethispage but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with \pagebreak) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a \clearpage: please give keep them clear of such places.

\@kludgeins The insert which makes T_EX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
2352 \newinsert \@kludgeins  
2353 \global\dimen\@kludgeins \maxdimen  
2354 \global\count\@kludgeins 1000
```

(End of definition for \@kludgeins.)

\enlargethispage The user command.

```
\enlargethispage* \gdef \enlargethispage {%
```

2355 \@ifstar

2356 {%

2357 {%

2358 <*trace>

2359 \f@trace{Enlarging page height * }%

2360 </trace>

2361 \@enlargepage{\hbox{\kern\p@}}}%

2362 {%

2363 <*trace>

2364 \f@trace{Enlarging page height exactly---}%

2365 </trace>

2366 \@enlargepage\@empty}%

2367 }

(End of definition for \enlargethispage and \enlargethispage*.)

\@enlargepage This actually inserts the insert, after checking for extreme values of the change.

```
2368 \gdef\@enlargepage#1#2{%
2369  {*trace}
2370   \f@trace{\@spaces\@spaces by #2}%
2371  {/trace}
2372  \tempskipa#2\relax
2373  \ifdim \tempskipa>.5\maxdimen
2374    \@latex@error{Suggested\space extra\space height\space
2375      (\the\tempskipa)\space dangerously\space
2376      large}\@eha
2377  \else
2378    \ifdim \vsize<.5\maxdimen
2379  {*trace}
2380    \f@trace {Kludgeins added--pagegoal before: \the\pagegoal}%
2381  {/trace}
2382  \bsphack
2383  \insert\kludgeins{#1\vskip-\tempskipa}%
2384  \esphack
```

This next bit is for tracing only:

```
2385 {*trace}
2386   \ifvmode \par
2387     \f@trace {Kludgeins added--pagegoal after: \the \pagegoal}%
2388   \fi
2389 {/trace}
2390   \else
2391     \@latex@error{Page\space height\space already\space
2392       too\space large}\@eha
2393   \fi
2394 \fi
2395 }
```

(End of definition for \@enlargepage.)

\ShowFloat This command provides some information about the contents of a float register. Float registers have internal names of the form \bx@*Uppercase-letter(s)-or numbers* and you specify just this letter or letters as the argument, e.g., \ShowFloat{A}. (There is not much error recovery if you specify something that isn't a float.)

2411   \f@traceval{\count#1} \% this here should be interpreted on day
```

```

2412   \f1@traceval{\ht#1}%
2413   \f1@traceval{\dp#1}%
2414   \f1@traceval{\wd#1}%
2415   {\tracingonline1\showboxbreadth10\showboxdepth3\showbox#1}%
2416 }

```

Here are two definitions from `fltrace` that make the above code work:

```

2417 \def \f1@traceval #1{\f1@trace{\string #1 = \the #1}}
2418 \def \f1@tracemessage #1{{\let\@elt\empty\typeout{LaTeX2e: #1}}}
2419 {/2ekernel | latexrelease}
2420 {latexrelease}\EndIncludeInRelease
2421 {latexrelease}\IncludeInRelease{0000/00/00}%
2422 {latexrelease} {\ShowFloat}{Show float register contents}%
2423 {latexrelease}
2424 {latexrelease}\let\ShowFloat\undefined
2425 {latexrelease}\let\f1@ShowFloat\undefined
2426 {latexrelease}\let\f1@traceval\undefined
2427 {latexrelease}\let\f1@tracemessage\undefined
2428 {latexrelease}\EndIncludeInRelease

```

(End of definition for `\ShowFloat`.)

2.2.4 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in `LaTeX2e`.

`\suppressfloats`

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

`[t]` suppresses only floats at the top of the page `[b]` suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, `!`, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\fl@trace      Set-up tracing for floats independent of other tracing as it produces mega-output. Default
\tracefloatoff is no tracing.

\tracefloats   2429  {*ftrace}

2499   \reserved@a\@addtocurcol
2500   \reserved@a\@addtonextcol
2501   \RequirePackage{flafter}{}}
2502 
```

As the code for `flafter` will contain tracing calls so that it works in conjunction with `fltrace` we need to provide a dummy definition for `\fl@trace` in that package.

```

2503 <*flafter>
2504 \providecommand\fl@trace[1]{}
2505 
```

(End of definition for `\fl@trace` and others.)

`\suppressfloats` Float suppression commands: these set the relevant counter globally to zero. Thus they
`\@flstop` are overridden for a particular float by an ! specifier.

```

2506 <*2ekernel>
2507 \def \suppressfloats {%
2508   \ifnextchar [%
2509     \@flstop
2510     {\global \colnum \z@}%
2511 }

```

Maybe this should be a loop over #1?

```

2512 \def \@flstop [#1]{%
2513   \if t#1%

```

```

2514      \global \c@topnum \z@
2515      \fi
2516      \if b#1%
2517          \global \c@botnum \z@
2518      \fi
2519  }

```

(End of definition for \suppressfloats and \oflstop.)

Manipulation of float placement and type; both their strings and the corresponding count registers.

\@fpstype First a new count register to go with \currtype.

\@reqcolroom Then a new skip register, for information needed to remove the \maxsep conservatism: it is possible that this could use a temporary register.

\@textfloatsheight Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of \addtocurcol which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

2520 \newcount \@fpstype
2521 \newdimen \@reqcolroom
2522 \newdimen \@textfloatsheight

```

(End of definition for \@fpstype, \@reqcolroom, and \@textfloatsheight.)

\saved@reqcolroom Saved value of \@reqcolroom; this is needed when making several tests.

```

2523 </2ekernel>
2524 <*2ekernel | latexrelease>
2525 <latexrelease>\IncludeInRelease{2025/06/01}%
2526 <latexrelease>           {\saved@reqcolroom}{float placement calculation}%
2527 \newdimen \saved@reqcolroom
2528 </2ekernel | latexrelease>
2529 <latexrelease>\EndIncludeInRelease
2530 <latexrelease>\IncludeInRelease{0000/00/00}%
2531 <latexrelease>           {\saved@reqcolroom}{float placement calculation}%
2532 <latexrelease>\let \saved@reqcolroom \undefined
2533 <latexrelease>\EndIncludeInRelease

```

(End of definition for \saved@reqcolroom.)

\@fpsadddefault Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```

def \@fpsadddefault {%
    \temptokena \expandafter\expandafter\expandafter
        {\csname fps@\@capttype \endcsname}%
    \edef \reserved@a {\the\temptokena}%
    \onelevel@sanitize \reserved@a
    \edef \@fps {\@fps\reserved@a}%
}

```

```

2534  {*2ekernel | fltrace}
2535  \def \@fpsadddefault {%
2536  <*trace>
2537  \f@trace{fps changed from: \@fps}%
2538  </trace>
2539  \edef \@fps {\@fps\csname fp@\@capttype \endcsname}%
2540  \@latex@warning {%
2541    No positions in optional float specifier.\MessageBreak
2542    Default added (so using '\@fps')}%
2543 }

(End of definition for \@fpsadddefault.)

\@setfloattypecounts Sets counters \@fpstype and \@currtype.
                      BANG == bit4 of \count\@currbox = 0.
2544 \def \@setfloattypecounts {%
2545   \@currtype \count\@currbox
2546   \@fpstype \count\@currbox
2547   \divide\@currtype\@xxxii \multiply\@currtype\@xxxii

(End of definition for \@setfloattypecounts.)
Macros for getting, testing and setting bits of the fps.

\@getfpsbit Sets \@tempcnta to required bit of \count\@currbox.
2573 {*2ekernel}
2574 \def \@getfpsbit {%
2575   \@boxfpsbit \@currbox
2576 }

(End of definition for \@getfpsbit.)

```

\@boxfpsbit Used above.

```
2577 \def \@boxfpsbit #1#2{%
2578   \tempcnta \count#1%
2579   \divide \tempcnta #2\relax
2580 }
```

(End of definition for \@boxfpsbit.)

\@testfp New definition of the float page test.

```
2581 \def \@testfp #1{%
2582   \@boxfpsbit #18\relax % Really '#1 8' for human readers!
2583   \ifodd \tempcnta
2584   \else
2585     \testtrue
2586   \fi
2587 }
```

(End of definition for \@testfp.)

\@setfpsbit Sets required bit of \tempcnta (to 1).

```
2588 \def \@setfpsbit #1{%
2589   \tempcntb \tempcnta
2590   \divide \tempcntb #1\relax
2591   \ifodd \tempcntb
2592   \else
2593     \advance \tempcnta #1\relax
2594   \fi
2595 }
2596 
```

(End of definition for \@setfpsbit.)

\@resethfps Globally adds t as a possible location for an h or !h only placement: this must be done using the count.

Although it will leave \@fpstype set to 17 even if it was originally 1, this does not matter since it is the last thing in \@addtocurcol.

```
2597 <*2ekernel | ftrace>
2598 \def \@resethfps {%
2599   \let\reserved@a\empty
2600   \ifnum \@fpstype=\@ne
2601     \def \reserved@a {!}%
2602     \@fpstype 17
2603   \fi
2604   \ifnum \@fpstype=17
2605     \global \advance \count\currbox \tw@
2606     \@latex@warning@no@line {%
2607       '\reserved@a h' float specifier changed to '\reserved@a ht'}%
2608   <*trace>
2609     \f1@trace{%
2610       't' added to '\reserved@a h'- new Count: \the \count\currbox}%
2611   </trace>
2612   \fi
2613 }
```

(End of definition for \@resethfps.)

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \@addtobblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```
2614 \def \@flsetnum #1{%
2615   (*trace)
2616     \f@trace{fpstype: \the \fpstype (\flsetnum \string#1)}%
2617   (/trace)
2618   \ifnum \fpstype<\sixt@n
2619     \ifnum #1=\z@
2620       (*trace)
2621         \f@trace{BANG float resetting \string#1 to 1}%
2622       (/trace)
2623         #1\@ne
2624       \fi
2625       \fi
2626     (*trace)
2627       \f@trace{#1 (before) = \the #1}%
2628   (/trace)
2629 }
```

(End of definition for \@flsetnum.)

\@flsettextmin This ignores \textfraction space restriction in case BANG.

```
2630 \def \@flsettextmin {%
2631   (*trace)
2632     \f@trace{fpstype: \the \fpstype (\flsettextmin)}%
2633   (/trace)
2634   \ifnum \fpstype<\sixt@n
2635     (*trace)
2636       \f@trace{BANG ignoring textmin}%
2637     (/trace)
2638       \textmin \z@
2639     \else
2640       \textmin \textfraction\colht
2641     (*trace)
2642       \f@trace{ORD textmin = \the \textmin}%
2643     (/trace)
2644       \fi
2645 }
```

(End of definition for \@flsettextmin.)

\@flcheckspace This ignores space restriction in case BANG; this is still slightly conservative since it does not allow for the fact that, if there is no text in the column then \textfloatsep is not needed. Sets \@tempswa true if there is room for \@currbox.

```

(End of definition for \@flupdates.)

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value \textfraction does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. \twocolumn floatplacement was wrong: dbl not needed, ord needed.
3. \@floatplacement was not called after \startdblcol or \topnewpage. This has been changed; it is clearly a bug fix.
4. The use \topnewpage when \dblfigrule is non-trivial produced a rule in the wrong place. This has been fixed by not using \dblfigrule when processing the ‘float’ from \topnewpage.
5. If the specifier was just h and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just h or !h should be deprecated.
6. \dblmaxsep was ‘the maximum of \dblfloatsep and \dbltexfloatsep’. But it was never used! Now gone completely, like \maxsep.
7. After an h float is put on a page, it was counted as text when applying the \textfraction test; this is possibly too big a change although it is a bug fix?
8. Two consecutive h floats are separated by twice \intextsep: this could be changed to one by use of \addvspace, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now \addtocurcol checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. \tryfcolumn now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from \startcolumn. As Frank pointed out, this makes \startcolumn less efficient. But it is now the same as \startdblcolumn: I can see no reason why they should be different, but which is best?

11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The `!` option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:

```
\twocolumn[\maketitle more text]
```

One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user’s viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the vskip to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.
It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the vskip adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.

It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.

22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
  % Why is this done first?
  \global \c@parbottom \z@
  \if@twocolumn
    \c@outputdblcol
  \else
    \c@outputpage
    % This is not needed since it is done at the end of
    % |\c@outputpage|:
    \global \c@colht \textheight
  \fi}
```

Only tracing has been added to these.

2.2.5 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

`\c@topnumber` This counter holds the maximum number of floats that can appear at the top of a text page or column.

```

2912 <{*2ekernel}>
2913 \newcount\c@topnumber
2914 \setcounter{topnumber}{2}

```

(End of definition for `\c@topnumber`.)

`\topfraction` This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

```
2915 \newcommand\topfraction{.7}
```

(End of definition for \topfraction.)

- \c@bottomnumber This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

2916 \newcount\c@bottomnumber
2917 \setcounter{bottomnumber}{1}

(End of definition for \c@bottomnumber.)

- \bottomfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.

2918 \newcommand\botttomfraction{.3}

(End of definition for \bottomfraction.)

- \c@totalnumber This counter holds the maximum number of floats that can appear on any text page or column.

2919 \newcount\c@totalnumber
2920 \setcounter{totalnumber}{3}

(End of definition for \c@totalnumber.)

- \textfraction This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

2921 \newcommand\textfraction{.2}

(End of definition for \textfraction.)

- \floatpagefraction This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.

2922 \newcommand\floatpagefraction{.5}

(End of definition for \floatpagefraction.)

- \c@dbltopnumber This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

2923 \newcount\c@dbltopnumber
2924 \setcounter{dbltopnumber}{2}

(End of definition for \c@dbltopnumber.)

- \dbltopfraction This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

2925 \newcommand\dbltopfraction{.7}

(End of definition for \dbltopfraction.)

- \dblfloatpagefraction This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.

2926 \newcommand\dblfloatpagefraction{.5}

(End of definition for \dblfloatpagefraction.)

Floats on a text page

\floatsep When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

\textfloatsep is the space between adjacent floats that are placed at the top or bottom of the text page or column.

\intextsep is the space between the main text and floats at the top or bottom of the page or column.

\intextsep is the space between in-text floats and the text.

```
2927 \newskip\floatsep
2928 \newskip\textfloatsep
2929 \newskip\intextsep
2930 \setlength\floatsep {12\p@ \oplus 2\p@ \ominus 2\p@}
2931 \setlength\textfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}
2932 \setlength\intextsep {12\p@ \oplus 2\p@ \ominus 2\p@}
```

(End of definition for \floatsep, \textfloatsep, and \intextsep.)

\dblfloatsep When double-column floats (floating objects that span the whole \textwidth) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by \dblfloatsep and \dbltextfloatsep. They are rubber lengths.

\dblfloatsep is the space between adjacent double-column floats placed at the top of the text page.

\dbltextfloatsep is the space between the main text and double-column floats at the top of the page.

```
2933 \newskip\dblfloatsep
2934 \newskip\dbltextfloatsep
2935 \setlength\dblfloatsep {12\p@ \oplus 2\p@ \ominus 2\p@}
2936 \setlength\dbltextfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}
```

(End of definition for \dblfloatsep and \dbltextfloatsep.)

Floats on their own page or column

\@fptop When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

\@fpsep At the top of the page \@fptop is inserted; typically this supplies some stretchable whitespace. At the bottom of the page \@fpbot is inserted. Between adjacent floats \@fpsep is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters \@fptop and \@fpbot should contain a plus ...fil so as to fill the remaining empty space.

```
2937 \newskip\fptop
2938 \newskip\fpsep
2939 \newskip\fpbot
2940 \setlength\fptop{0\p@ \oplus 1fil}
2941 \setlength\fpsep{8\p@ \oplus 2fil}
2942 \setlength\fpbot{0\p@ \oplus 1fil}
```

(End of definition for \@fptop, \@fpsep, and \@fpbot.)

```
\@dblftop Double-column ‘float pages’ in two-column mode use similar parameters.  
\@dblpsep 2943 \newskip\@dblftop  
\@dblfpbot 2944 \newskip\@dblpsep  
2945 \newskip\@dblfpbot  
2946 \setlength\@dblftop{0\p@ \oplus 1fil}  
2947 \setlength\@dblpsep{8\p@ \oplus 2fil}  
2948 \setlength\@dblfpbot{0\p@ \oplus 1fil}
```

(*End of definition for \@dblftop, \@dblpsep, and \@dblfpbot.*)

\topfigrule The macros can be used to put in rules between floats and text; whatever they insert
\botfigrule should be vertical mode material which takes up zero space.

```
\dblfigrule 2949 \let\topfigrule=\relax  
2950 \let\botfigrule=\relax  
2951 \let\dblfigrule=\relax  
2952 ⟨/2ekernel⟩
```

(*End of definition for \topfigrule, \botfigrule, and \dblfigrule.*)

```

1 General support for tagged output

\SuspendTagging

\ResumeTagging The are places in code where it is import top stop any tagging activities, e.g., when we \tag_suspend:n are doing trial typesetting that it is done several times. In such a case one must tag only \tag_resume:n the final version that is actually used, otherwise tagging structures are generated which then do not end up in the PDF and confuse the mechanism. For this we have two commands that can be used in packages: \SuspendTagging and \ResumeTagging (with corresponding L3 programming layer commands). They are available as part of the L^AT_EX kernel, so that they can be safely used in packages whether or not tagging is requested. They all take a string argument that is used for debugging to easily identify why tagging was suspended or restarted, for example, in tabularx you find \SuspendTagging{tabularx}. By default these four commands do nothing.

The argument is used literally (in \typeout messages) without any expansion when debugging is turned on and otherwise it is not used at all. This means it is safe to write something like \SuspendTagging{\foo} or even \SuspendTagging\foo which means L^AT_EX has to parse only a single token instead of putting a string of characters into the argument. This means a tiny speed improvement but with many such debugging strings...

\UseTaggingSocket

Given that we sometimes have to suspend tagging, it would be fairly inefficient \tag_socket_use:n to put different plugs into these sockets whenever that happens. We therefore offer \tag_socket_use:nn \UseTaggingSocket which is like \UseSocket except that is expects a socket starting \tag_socket_use:nnn with tagsupport/ but the socket name is specified without this prefix, i.e.,

```
\UseTaggingSocket{foo} → \UseSocket{tagsupport/foo}
```

Beside being slightly shorter, the big advantage is that this way we can change \UseTaggingSocket to do nothing by switching a boolean instead of changing the plugs of the tagging support sockets back and forth.

Usually, these sockets have (beside the default plug defined for every socket) one additional plug defined and directly assigned. This plug is used when tagging is active. There may be more plugs, e.g., tagging with special debugging or special behavior depending on the class or PDF version etc., but right now it is usually just on or off.

When tagging is suspended they all have the same predefined behavior: The sockets with zero arguments do nothing. The sockets with one argument gobble their argument. The sockets with two arguments will drop their first argument and pass the second unchanged.

It is possible to use the tagging support sockets with \UseSocket directly, but in this case the socket remains active if \SuspendTagging is in force. There may be reasons for doing that but in general we expect to always use \UseTaggingSocket.

\UseExpandableTaggingSocket

For special cases like in some \halign contexts we need a fully expandable version \tag_socket_use_expandable:n of the command. For these cases, \UseExpandableTaggingSocket can be used. To allow

being expandable, it does not output any debugging information if `\DebugSocketsOn` is in effect and therefore should be avoided whenever possible.

The L3 programming layer versions `\tag_socket_use_expandable:n`, `\tag_socket_use:n`, `\tag_socket_use:nn`, and `\tag_socket_use:nnn` are slightly more efficient than `\UseTaggingSocket` because they do not have to determine how many arguments the socket takes when disabling it.

`\MathCollectTrue` The tagging of math has to collect/grab the math first. This is not wanted for all
`\MathCollectFalse` uses of `$`. These command allow to control the behavior of the math shift token. Without the math tagging code they do nothing. Their behavior with the math tagging code is documented in `latex-lab-math.pdf`

2 Implementation

`\tag_suspend:n` In the kernel, these commands get dummy definitions so that they can be used without harm in packages. The real definition is used when tagging gets enabled.

```

\tag_resume:n
\SuspendTagging
\ResumeTagging
 3 \cs_new_eq:NN \tag_suspend:n \use_none:n
 4 \cs_new_eq:NN \tag_resume:n \use_none:n
 5 \cs_new_protected:Npn \SuspendTagging #1 { \tag_suspend:n {#1} }
 6 \cs_new_protected:Npn \ResumeTagging #1 { \tag_resume:n {#1} }
```

(End of definition for `\tag_suspend:n` and others.)

`\tag_socket_use:n` Again this is not the final definition for the kernel; it is just a version to get going while some parts of the kernel support are still missing.

```

\tag_socket_use:nn
\tag_socket_use:nnn
\tag_socket_use_expandable:n
 7 \prg_new_conditional:Npnn \tag_if_active: { p , T , TF, F }
 8   { \prg_return_false: }
```

Dummy definitions in the kernel. These definitions will get updated in `tagpdf`. The default in the kernel is simply to get rid of the first argument, while the second argument is preserved if present:

```

 9 \cs_new:Npn \tag_socket_use_expandable:n #1 { }
10 \cs_new_protected:Npn \tag_socket_use:n #1 { }
11 \cs_new_protected:Npn \tag_socket_use:nn #1#2 { }
12 \cs_new_protected:Npn \tag_socket_use:nnn #1#2#3 { #3 }
13 \cs_new_protected:Npn \UseTaggingSocket #1 {
14   \int_case:nnF
15     { \int_use:c { c__socket_tagsupport/#1_args_int } }
16   {
17     0 \prg_do_nothing:
18     1 \use_none:n
19     2 \use_i:nn
```

We do not expect tagging sockets with more than one or two arguments, so for now we only provide those.

```

20   }
21   \ERRORusetaggingsocket % that should get a proper error message
22 }
```

The same as an expandable command:

```

23 \cs_new:Npn \UseExpandableTaggingSocket #1 {
24   \int_case:nnF
25     { \int_use:c { c__socket_tagsupport/#1_args_int } }
26   {
```

```

27          0 \prg_do_nothing:
28          1 \use_none:n
29          2 \use_i:nn
30      }
31      \ERRORusetaggingsocket % that should get a proper error message
32  }

```

(End of definition for `\tag_socket_use:n` and others.)

2.1 Math collection

The documentation is in `latex-lab-math`.

```

\MathCollectTrue
\MathCollectFalse 33 \cs_new_protected:Npn\MathCollectTrue{}
34 \cs_new_protected:Npn\MathCollectFalse{}

```

(End of definition for `\MathCollectTrue` and `\MathCollectFalse`.)

2.2 Tagging sockets

This collects tagging sockets that should be generally available so that they can also be used even if the tagging code is not loaded.

2.2.1 Tagging support for paragraph setup

Paragraphs are tagged through the code in the para/hooks. This code is sometimes adjusted, e.g. to produce a “flattened” paragraph or to use a different tag. Sockets related to such code parts are collected here.

`\l__tag_block_flattened_level_int` The block code needs to know if they are nested blockenvs inside a flattened environment. For this it uses a counter. Inside some contexts, e.g. at the begin of a minipage or a footnote this counter must be reset. We therefore define the counter here so that we can use it in the following socket.

```
35 \int_new:N \l__tag_block_flattened_level_int
```

(End of definition for `\l__tag_block_flattened_level_int`.)

`\tagsupport/para/restore (socket)` This socket restores the para related settings to their default. It should be used in places where “normal” paragraph tagging must be ensured, for example at the begin of a footnote.

```
36 \NewSocket{\tagsupport/para/restore}{0}
```

`default (plug)`

```

37 \NewSocketPlug{\tagsupport/para/restore}{default}
38 {
39     \tl_set:Nn    \l__tag_para_main_tag_tl {text-unit}
40     \tl_set_eq:NN \l__tag_para_tag_tl\l__tag_para_tag_default_tl
41     \bool_set_false:N\l__tag_para_flattened_bool
42     \int_zero:N  \l__tag_block_flattened_level_int
43     \bool_set_true:N \l__tag_para_bool
44 }
45 \AssignSocketPlug{\tagsupport/para/restore}{default}

```

`tagsupport/para/begin (socket)` These sockets are currently defined in tagpdf. They overwrite definitions in the latex-lab-
`tagsupport/para/end (socket)` block code. There is also a simpler definition that probably should be a general socket
too. TODO: move this into lttagging.

2.2.2 Tagging socket for targets

`tagsupport/refstepcounter (socket)` When tagging is active we want to track the current structure number when targets are set. This will be mostly used in `\refstepcounter` but also if targets are set manually.

```
46 \NewSocket{tagsupport/recordtarget}{0}
```

`tagsupport/recordtarget) (plug)`

```
47 %
48 \NewSocketPlug{tagsupport/recordtarget}{kernel}
49 {
50     \tl_if_blank:VF \currentHref
51     {
52         \prop_gput:Nne
53         \g__tag_struct_dest_num_prop
54         {\currentHref}
55         {\tag_get:n{struct_num}}
56     }
57 }
58 \AssignSocketPlug{tagsupport/recordtarget}{kernel}
59 \ExplSyntaxOff
```

2.2.3 Tagging sockets for toc

`toc/contentsline/before (socket)` Tagging sockets at the begin and end of contentsline. They receive *all* contentsline
`toc/contentsline/after (socket)` arguments as one argument in four brace groups. The socket code should then use the parts it needs.

```
60 \NewSocket{tagsupport/toc/contentsline/before}{1}
61 \NewSocket{tagsupport/toc/contentsline/after}{1}

62 \AssignSocketPlug{tagsupport/toc/contentsline/before}{noop}
63 \AssignSocketPlug{tagsupport/toc/contentsline/after}{noop}
```

`port/toc/starttoc/before (socket)` Tagging sockets for the begin and end of start of `\@starttoc`. They take one argument,
`port/toc/starttoc/after (socket)` the extension.

```
64 \NewSocket{tagsupport/toc/starttoc/before}{1}
65 \NewSocket{tagsupport/toc/starttoc/after}{1}

66 \AssignSocketPlug{tagsupport/toc/starttoc/before}{noop}
67 \AssignSocketPlug{tagsupport/toc/starttoc/after}{noop}
```

`port/toc/leaders/before (socket)` Tagging sockets to make the dot leaders an artifact. They do not take an argument.

`port/toc/leaders/after (socket)`

```
68 \NewSocket{tagsupport/toc/leaders/before}{0}
69 \NewSocket{tagsupport/toc/leaders/after}{0}
```

2.2.4 Tagging support for marginpar

`support/marginpar/begin (socket)`

`agsupport/marginpar/end (socket)`

```
70 \NewSocket{tagsupport/marginpar/begin}{0}
71 \NewSocket{tagsupport/marginpar/end}{0}
```

2.2.5 Tagging support for table/tabular packages

The code uses a number of sockets to inject the tagging commands. These can be easily set to a noop-plug in case the automated tagging is not wanted.

```

tagsupport/tbl/cell	begin (socket) At first sockets for the begin and end of cells and table rows:
tagsupport/tbl/cell/end (socket)    72 \NewSocket{tagsupport/tbl/cell/begin}{0}
tagsupport/tbl/pcell/end (socket)   73 \NewSocket{tagsupport/tbl/cell/end}{0}
tagsupport/tbl/pcell/end (socket)   74 \NewSocket{tagsupport/tbl/row/begin}{0}
tagsupport/tbl/row	begin (socket)  75 \NewSocket{tagsupport/tbl/row/end}{0}
tagsupport/tbl/row/end (socket)

Multi-line cells have their own sockets (as they start out in vertical mode and need different treatment).
    76 \NewSocket{tagsupport/tbl/pcell/begin}{0}
    77 \NewSocket{tagsupport/tbl/pcell/end}{0}

tagsupport/tbl/init (socket) This socket should be at the begin of the table, inside a group. It is used for settings such as disabling para-tagging inside the table. This socket can perhaps be merged later into the begin-sockets.
    78 \NewSocket{tagsupport/tbl/init}{0}

port/tbl/init/celldata (socket) This socket is used in \tbl_init_cell_data_for_table, the command that stores and initialize cell data to handle nested tables. It can be used to restore similar tagging related values
    79 \NewSocket{tagsupport/tbl/init/celldata}{0}

agsupport/tbl/finalize (socket) To fine tune the structure (change cells to header cells, remove unwanted structures, move a foot to the end, etc.). We also need a socket that is executed at the end of the table but before all the variables are restored to the outer or default values. The code in the socket can make assignments, but probably shouldn't do typesetting and not write whatsits.
    80 \NewSocket{tagsupport/tbl/finalize}{0}

rt/tbl/restore/celldata (socket) This socket is used in \tbl_restore_outer_cell_data:, the command that restores cell data when quitting a nested table. It can be used to restore similar tagging related values
    81 \NewSocket{tagsupport/tbl/restore/celldata}{0}

tagsupport/tbl/colspan (socket) This socket is used to manage spanning cells, e.g., a \multicolumn. It expects one argument (the number of cells spanned) and if tagging is enabled set appropriate tag attributes in the background. We probably need a similar socket for row spans eventually.
    82 \NewSocket{tagsupport/tbl/colspan}{1}
    83 \AssignSocketPlug{tagsupport/tbl/colspan}{noop}

support/tbl/hmode/begin (socket) These sockets are used in the begin and end code of environments, to allow a fast enabling
agsupport/tbl/hmode/end (socket) and disabling of the tagging. We distinguish between tables that can be used inside
support/tbl/vmode/begin (socket) paragraphs and standalone tables such as longtable that are always in vertical mode.
agsupport/tbl/vmode/end (socket)
    84 \NewSocket{tagsupport/tbl/hmode/begin}{0}
    85 \NewSocket{tagsupport/tbl/hmode/end}{0}
    86 \NewSocket{tagsupport/tbl/vmode/begin}{0}
    87 \NewSocket{tagsupport/tbl/vmode/end}{0}

```

`\port/tbl/longtable/init (socket)` longtable needs its own sockets to fine tune the structure. Simply switching the plug `\tbl/longtable/finalize (socket)` in the previous socket interferes with enabling/disabling the tagging.

```
88 \NewSocket{tagsupport/tbl/longtable/init}{0}
89 \NewSocket{tagsupport/tbl/longtable/finalize}{0}
```

`\port/tbl/longtable/head (socket)` Header and footer boxes need special handling because they are repeatedly used.

```
90 \NewSocket{tagsupport/tbl/longtable/head}{0}
91 \NewSocket{tagsupport/tbl/longtable/foot}{0}
```

`\port/tbl/leaders/begin (socket)` Sockets around leaders such as rules or dotted lines, that should be tagged as artifacts, `\support/tbl/leaders/end (socket)` used, for example, in `\cline`.

```
92 \NewSocket{tagsupport/tbl/leaders/begin}{0}
93 \NewSocket{tagsupport/tbl/leaders/end}{0}
```

2.2.6 Tagging Support for floats

`\port/float/hmode/begin (socket)` These sockets are used if the float is called in hmode.

```
94 \NewSocket{tagsupport/float/hmode/begin}{0}
95 \NewSocket{tagsupport/float/hmode/end}{0}
```

`\tagsupport/float/begin (socket)` These sockets start and stop the float structure.

```
96 \NewSocket{tagsupport/float/begin}{0}
97 \NewSocket{tagsupport/float/end}{0}
```

`\gsupport/caption/begin (socket)` These sockets are used in `\@makecaption`. They open and close the `Caption` structure.

`\tagsupport/caption/end (socket)` Their default plugs assume that they are used in vmode. The argument of the begin socket is the structure number of the parent float. If it is empty the current structure number is used.

```
98 \NewSocket{tagsupport/caption/begin}{1}
99 \NewSocket{tagsupport/caption/end}{0}

100 \AssignSocketPlug{tagsupport/caption/begin}{noop}
```

`\port/caption/label/begin (socket)` These sockets are used in `\@makecaption` around the label. Their default plugs ensure

`\port/caption/label/end (socket)` that the label is outside the paragraph and that the rest of the caption uses flattened para mode. If the caption is not in a hbox, the `para/begin` socket should follow to properly start the paragraph.

```
101 \NewSocket{tagsupport/caption/label/begin}{0}
102 \NewSocket{tagsupport/caption/label/end}{0}
```

2.3 Tagging support for output routines

`\port/build/page/header (socket)` These sockets receive the formatted running header/footer in its second argument (the `\port/build/page/footer (socket)` first is not used) following the convention of tagging sockets, i.e., only the second argument is processed if tagging is not active

```
103 \NewSocket{tagsupport/build/page/header}{2}
104 \NewSocket{tagsupport/build/page/footer}{2}

105 \NewSocketPlug{tagsupport/build/page/header}{transparent}{#2}
106 \NewSocketPlug{tagsupport/build/page/footer}{transparent}{#2}

107 \AssignSocketPlug{tagsupport/build/page/header}{transparent}
108 \AssignSocketPlug{tagsupport/build/page/footer}{transparent}
```

```
'build/column/outputbox (socket) This socket is used to add any missing tagging structures to the \outputbox box, if necessary.  

109 \NewSocket{tagsupport/build/column/outputbox}{0}  

rt/build/column/footins (socket) This socket is used to add any missing tagging structures to the \footins box, if necessary.  

110 \NewSocket{tagsupport/build/column/footins}{0}  

tagsupport/page@sofar (socket) This socket is declared and used in the multicol output routines. Only listed for reference.  

111 \%NewSocket{tagsupport/page@sofar}{0}
```

2.4 Tagging support for math

2.4.1 General sockets

The following sockets are the main math sockets.

```
112 \NewSocket{tagsupport/math/inline/begin}{0}  

113 \NewSocket{tagsupport/math/inline/end}{0}  

114 \NewSocket{tagsupport/math/inline/formula/begin}{2}  

115 \NewSocket{tagsupport/math/inline/formula/end}{0}  

116 \NewSocket{tagsupport/math/display/begin}{0}  

117 \NewSocket{tagsupport/math/display/end}{0}  

118 \NewSocket{tagsupport/math/display/formula/begin}{2}  

119 \NewSocket{tagsupport/math/display/formula/end}{0}  

120 \NewSocket{tagsupport/math/display/tag/begin}{0}  

121 \NewSocket{tagsupport/math/display/tag/end}{0}
```

Assign transparent socket to the sockets with two arguments:

```
122 \NewSocketPlug{tagsupport/math/inline/formula/begin}{transparent}{#2}  

123 \AssignSocketPlug{tagsupport/math/inline/formula/begin}{transparent}  

124 \NewSocketPlug{tagsupport/math/display/formula/begin}{transparent}{#2}  

125 \AssignSocketPlug{tagsupport/math/display/formula/begin}{transparent}
```

2.4.2 Sockets specific for luamml

Save sockets These sockets are wrappers around the \luamml_save:... commands. They take an argument which should contain the argument of the save command.

```
rt/math/luamml/save/nn (socket) The argument should contain the two arguments of the command.
```

```
126 \NewSocket{tagsupport/math/luamml/save/nn}{1}  

127 \AssignSocketPlug{tagsupport/math/luamml/save/nn}{noop}
```

```
rt/math/luamml/save/nNn (socket) The argument should contain the three arguments of the command.
```

```
128 \NewSocket{tagsupport/math/luamml/save/nNn}{1}  

129 \AssignSocketPlug{tagsupport/math/luamml/save/nNn}{noop}
```

Socket to annotate

```
/luamml/annotate/false (socket) These socket can be used for content that should be annotated with core=false
```

```
130 \NewSocket{tagsupport/math/luamml/annotate/false}{2}  

131 \NewSocketPlug{tagsupport/math/luamml/annotate/false}{transparent}{#2}  

132 \AssignSocketPlug{tagsupport/math/luamml/annotate/false}{transparent}
```

Array sockets These sockets will be used in `array` to add luamml support to the array environment.

`\math/luamml/array/save (socket)` This socket will be used in `\endarray`. The plug is set by luamml.

133 \NewSocket{tagsupport/math/luamml/array/save}{0}

`\luamml/array/finalize (socket)` This socket will be used in `\endarray`. The plug is set by luamml.

134 \NewSocket{tagsupport/math/luamml/array/finalize}{0}

`\h/luamml/array/initcol (socket)` This socket will be used in `\@classz`. The plug is set by luamml.

135 \NewSocket{tagsupport/math/luamml/array/initcol}{0}

`\amml/array/finalizecol (socket)` This socket will be used in `\@classz`. The plug is set by luamml. The argument sets the type of the column.

136 \NewSocket{tagsupport/math/luamml/array/finalizecol}{1}

137 \AssignSocketPlug{tagsupport/math/luamml/array/finalizecol}{noop}

Alignment environments Multiline environments like `align`, `multiline` or `gather` are tagged as `mtable`.

`\amml/mtable/finalizecol (socket)` This socket is used at the end of alignment cells and adds them to the row. The argument passes a type like `last` or `box`.

138 \NewSocket{tagsupport/math/luamml/mtable/finalizecol}{1}

139 \AssignSocketPlug{tagsupport/math/luamml/mtable/finalizecol}{noop}

`\luamml/mtable/finalize (socket)` This socket is used at the end of alignment environment to finalize the mtable code. It should be used normally with `\UseExpandableTaggingSocket`.

140 \NewSocket{tagsupport/math/luamml/mtable/finalize}{1}

141 \AssignSocketPlug{tagsupport/math/luamml/mtable/finalize}{noop}

`\luamml/mtable/aligncol (socket)` This socket is used in multiline to add attributes describing the alignment to the left and right. It takes an argument, the alignment.

142 \NewSocket{tagsupport/math/luamml/mtable/aligncol}{1}

143 \AssignSocketPlug{tagsupport/math/luamml/mtable/aligncol}{noop}

`\mtable/innertable/save (socket)` This socket is used in `\endaligned` to save the table. It takes no argument.

144 \NewSocket{tagsupport/math/luamml/mtable/innertable/save}{0}

`\table/smallmatrix/save (socket)` This socket is used in `\endsmallmatrix` to save the table. It takes no argument. TODO: Check if this socket and the innertable socket can/should be merged into a more generic version.

145 \NewSocket{tagsupport/math/luamml/mtable/smallmatrix/save}{0}

`\le/innertable/finalize (socket)` This socket is used e.g. in `\endsmallmatrix` and `\gathered` to finalize the table. It takes no argument.

146 \NewSocket{tagsupport/math/luamml/mtable/innertable/finalize}{0}

`\luamml/mtable/tag/save (socket)` This socket is used to save a tag for later use. has been save before.

147 \NewSocket{tagsupport/math/luamml/mtable/tag/save}{0}

`\luamml/mtable/tag/set (socket)` This socket should be used when a tag is placed. It inserts a tag that has been save before.

148 \NewSocket{tagsupport/math/luamml/mtable/tag/set}{0}

mbox socket

support/math/luamml/hbox (socket) This socket is used around \hbox inside an \mbox, \makebox and \text and annotates the content if the \hbox is used inside math. The real plug is set by luamml but a default plug is defined here so that the socket can also be used if luamml is not used.

```
149 \NewSocket{tagsupport/math/luamml/hbox}{2}
150 \NewSocketPlug{tagsupport/math/luamml/hbox}{transparent}{#2}
151 \AssignSocketPlug{tagsupport/math/luamml/hbox}{transparent}
```

math phantom sockets

t/math/luamml/finph@nt (socket) This socket handles the annotation of \finph@nt

```
152 \NewSocket{tagsupport/math/luamml/finph@nt}{2}
153 \NewSocketPlug{tagsupport/math/luamml/finph@nt}{transparent}{#2}
154 \AssignSocketPlug{tagsupport/math/luamml/finph@nt}{transparent}
```

t/math/luamml/finph@nt (socket) This socket handles the annotation of \finsm@sh

```
155 \NewSocket{tagsupport/math/luamml/finsm@sh}{2}
156 \NewSocketPlug{tagsupport/math/luamml/finsm@sh}{transparent}{#2}
157 \AssignSocketPlug{tagsupport/math/luamml/finsm@sh}{transparent}
```

Artifact root sign

t/math/luamml/artifact (socket) Unicode characters like a root sign should be marked as artifacts to avoid duplication, e.g., in derivation if mathml structure elements are used that imply the meaning.

```
158 \NewSocket{tagsupport/math/luamml/artifact}{0}
```

3 For lttab.dtx parked here for now

```
159 <@=tbl>
160 \ExplSyntaxOn
```

3.1 Variables for row, column and span counting

This part needs a decision on names for various integer registers as well as a decision if those should be also made available for L^AT_EX 2_&-style packages in form of 2e names and or as non-internals for the L3 programming layer.

At the moment they are all internal but this probably has to change.

\g__tbl_col_int \g__tbl_row_int holds the current row number in the table. The value 0 means we haven't yet processed the table preamble (or in case of longtable are just in front of the next chunk to be processed). It is incremented by every \cr including the one ending the table preamble.

TODO: due to the gymnastics needed inside the longtable code the row counter is directly exposed there rather than hidden by interfaces. This needs changing when it is decided how to manage these counters.

\g__tbl_col_int holds the current column number. The value 0 means we have not yet started the table or just finished a table row (with \\ typically); any other positive value means we are currently typesetting a cell in that column in some row (denoted by the \g__tbl_row_int).

In a `\multicolumn` it holds the column number of the first spanned column and `\g__tbl_span_tl` the info how many cells are spanned.

`\g__tbl_span_tl` is normally 1 except in a `\multicolumn` cell.

```
161 \int_new:N \g__tbl_col_int
162 \int_new:N \g__tbl_row_int
163 \tl_new:N \g__tbl_span_tl
164 \tl_new:N \g__tbl_table_cols_tl
165
166 \tl_gset:Nn \g__tbl_span_tl {1}
167 \tl_gset:Nn \g__tbl_table_cols_tl {0} % indicates outer level
```

(End of definition for `\g__tbl_col_int` and others.)

`\l__tbl_saved_col_tl` Saving the outer values if we are nesting tables is necessary (as the above variables are globally altered). For this we always use token lists because they don't change and we do not need to blow additional integer registers.

```
\l__tbl_saved_table_cols_tl
168 \tl_new:N \l__tbl_saved_col_tl
169 \tl_new:N \l__tbl_saved_row_tl
170 \tl_new:N \l__tbl_saved_span_tl
171 \tl_new:N \l__tbl_saved_table_cols_tl
172
173 \tl_set:Nn \l__tbl_saved_col_tl{0}
174 \tl_set:Nn \l__tbl_saved_row_tl{0}
175 \tl_set:Nn \l__tbl_saved_span_tl{1}
176 \tl_set:Nn \l__tbl_saved_table_cols_tl{0} % indicates outer level
```

(End of definition for `\l__tbl_saved_col_tl` and others.)

`\g__tbl_missingcells_int` This will contain the number of missing cells in a row:

```
177 \int_new:N \g__tbl_missing_cells_int
```

(End of definition for `\g__tbl_missingcells_int`.)

3.2 Tracing/debugging

```
\DebugTablesOn
\DebugTablesOff
178 \def\DebugTablesOn{
179   \cs_set_eq:NN \__tbl_trace:n \typeout
180 }
181 \def\DebugTablesOff{
182   \cs_set_eq:NN \__tbl_trace:n \use_none:n
183 }
184 \cs_new_eq:NN \__tbl_trace:n \use_none:n
```

(End of definition for `\DebugTablesOn` and `\DebugTablesOff`.)

3.3 Interface commands

All interface commands for the cell number determination have to be public on some level because they are needed in other packages as well, e.g., longtable. We may or may not also want to provide 2e style names for them.

\tbl_update_cell_data: Updating cell data in columns after the first means we have to increment the \g__tbl_col_int by the span count of the previous cell (in case it was a \multicolumn) and then reset the \g__tbl_span_tl to one (as the default).

```

185 \cs_new_protected:Npn \tbl_update_cell_data: {
186     \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
187     \tl_gset:Nn \g__tbl_span_tl {1}
188 }
```

(End of definition for \tbl_update_cell_data:.)

\tbl_count_table_cols: Current implementation of \mkpream uses the scratch counter \count@ to keep track of the number of toks registers it needs (2 per column), but this can't be used as it counts also insertions made with !{} and @{}. So similar as does longtable for \LT@cols we count the numbers of ampersands instead.

```

189 \cs_new:Npn \tbl_count_table_cols: {
190     \seq_set_split:NnV\l__tbl_tmpa_seq {&}@\preamble

194 \seq_new:N \l__tbl_tmpa_seq
```

(End of definition for \l__tbl_tmpa_seq.)

\tbl_count_missing_cells:n We might have the situation that some table package has not implemented the \tbl_count_table_cols: in which case \g__tbl_table_cols_tl would always be zero and we would get an error below when we try to determine the missing cells, so bypass that calculation if we aren't doing tagging (there the packages should have the proper code added). Recall that this is code, that is called by \\ and an old table package might rely on whatever the L^AT_EX kernel offers here.

```

267     \int_gset:Nn \g__tbl_row_int { \l__tbl_saved_row_t1 }
268     \tl_gset_eq:NN \g__tbl_span_t1 \l__tbl_saved_span_t1
269     \tl_gset_eq:NN \g__tbl_table_cols_t1 \l__tbl_saved_table_cols_t1
270     \UseTaggingSocket{tbl/restore/celldata}
```

```

271   \__tbl_trace:n { ==>~ restored-cell-data:~
272     \int_use:N \g__tbl_row_int,
273     \int_use:N \g__tbl_col_int,
274     \l__tbl_saved_span_tl \space
275     (
276       \int_compare:nNnTF \g__tbl_table_cols_tl = 0
277         { outer~ level }
278         { max:~ \g__tbl_table_cols_tl }
279     )
280   }
281 }
```

(End of definition for \tbl_restore_outer_cell_data:.)

\tbl_update_multicolumn_cell_data:n This macro updates \g__tbl_col_int and \g__tbl_span_tl inside a \multicolumn and possibly calls the tagging socket tbl/row/begin.

```
282 \cs_new_protected:Npn \tbl_update_multicolumn_cell_data:n #1 {
```

We execute socket for tagging only if this \multicolumn replaces the preamble of the first column. In that case we also have to set \g__tbl_col_int to 1 because this is no longer done in the preamble for the cell either.

```

283   \int_compare:nNnTF \g__tbl_col_int = 0
284     {
285       \UseTaggingSocket{tbl/row/begin}
286       \int_gset:Nn \g__tbl_col_int {1}
287     }
```

If we are in a later column we use \g__tbl_span_tl from the previous column to update.

```

288   {
289     \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
290   }
```

Then we set the span value so that it can be used in the next column.

```

291   \tl_gset:Nn \g__tbl_span_tl {#1}
292 }
```

(End of definition for \tbl_update_multicolumn_cell_data:n.)

\tbl_crcr:n This macro is used instead of the usual \crcr at the end of a table. It is deliberately defined without protection because it may get expanded by the scanning mechanism of low-level T_EX after a final \cr (aka \\) in the table. In that case it shouldn't stop the expansion and the conditional inside will be false, thus it just vanishes without doing anything. If there are missing cells (in which case we also haven't seen \cr yet) the macro \tbl_count_missing_cells:n is executed and then the row is finished with a final \cr.

```

293 \cs_new:Npn \tbl_crcr:n #1 {
294   \int_compare:nNnT \g__tbl_col_int > 0
295   {
296     \tbl_count_missing_cells:n {#1}
297   }
```

Even if we are at the start of a row we may have to do a \cr, so we do a \crcr always at the end.

```

298   \crcr
299 }
```

(End of definition for \tbl_crcr:n.)

```
300 \ExplSyntaxOff
301 ⟨@=⟩
```

This is needed for longtable because \refstepcounter is setting up a target when hyperref is loaded and we don't want that in longtable. Prevent longtable patching by hyperref until hyperref does so automatically:

```
302 \def\hyper@nopatch@longtable{}
```

Should there be a module?

```

304 ⟨latexrelease⟩                                {Tagging support}
305 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}{ltagging}%
306 ⟨latexrelease⟩                                {Undo tagging support}
307 ⟨latexrelease⟩
308 ⟨latexrelease⟩
309 ⟨latexrelease⟩
310 ⟨latexrelease⟩\EndModuleRelease
311 ⟨/2ekernel | latexrelease⟩
```

File 56

lthyphen.dtx

This file contains the code for loading hyphenation patterns into L^AT_EX. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L^AT_EX system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the `DOCSTRIP` program, or one can run this file directly through L^AT_EX 2 _{ε} .

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T_EX's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 <*default>
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}%
10    \language=0
11    \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT_EX run is terminated by invoking `\@@end` (which is the L^AT_EX 2 _{ε} name for T_EX's `\end` primitive).

```
12 {\errhelp{The configuration for hyphenation is incorrectly
13           installed.^^J%
14           If you don't understand this error message you need
15           to seek^Jexpert advice.}%
16 \errmessage{OOPS! I can't find any hyphenation patterns for
17             US english.^^J \space Think of getting some or the
18             latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyph31
```

```
language=0
lefthyphenmin=2
righthyphenmin=3
endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

File 57

ltfinal.dtx

1 Final settings

This section contains the final settings for L^AT_EX. It initializes some debugging and typesetting parameters, sets the default \catcodes and uc/lc codes, and inputs the hyphenation file.

1.1 Debugging

By default, L^AT_EX shows statistics:

```
1  {*2ekernel}
2  \tracingstats1
```

1.2 Typesetting parameters

\@lowpenalty These are penalties used internally.
\@medpenalty
\@highpenalty

```
3  \newcount\@lowpenalty
4  \newcount\@medpenalty
5  \newcount\@highpenalty
```

(End of definition for \@lowpenalty, \@medpenalty, and \@highpenalty.)

\newmarks Allocate extended marks types if etex is active. Placed here at the end of the format to increase compatibility with count allocations in earlier releases.

```
6  {/2ekernel}
7  {*2ekernel | latexrelease}
8  {latexrelease}\IncludeInRelease{2015/01/01}%
9  {latexrelease}          {\newmarks}{Extended Allocation}%
10 \ifx\marks\@undefined\else
11 \def\newmarks{%
12   \e@alloc\marks \e@alloc@chardef{\count256}\m@ne\@alloc@top}
13 \fi
14 {/2ekernel | latexrelease}
15 {latexrelease}\EndIncludeInRelease
16 {latexrelease}\IncludeInRelease{0000/00/00}%
17 {latexrelease}          {\newmarks}{Extended Allocation}%
18 {latexrelease}\let\newmarks\@undefined
19 {latexrelease}\EndIncludeInRelease
20 {*2ekernel}
```

(End of definition for \newmarks.)

Allocate 3 mark classes to be used in \markboth and \markright. Should be done earlier but for that definition of \newmarks needs moving (which it should I guess).

```
21 {/2ekernel}
22 {*2ekernel | latexrelease}
23 {latexrelease}\IncludeInRelease{2022/06/01}%
24 {latexrelease}          {2e-left}{Delayed legacy marks}%
25 \NewMarkClass {2e-left}
```

```

26 \NewMarkClass {2e-right}
27 \NewMarkClass {2e-right-nonempty}
No rollback really, the marks will remain.
28 </2ekernel | latexrelease>

(End of definition for trace_stack_levels.)

The default values of the picture and \fbox parameters:

```

149 \unitlength = 1pt
150 \fboxsep = 3pt
151 \fboxrule = .4pt

```

The saved value of TeX's \maxdepth:

```

152 \cmaxdepth      = \maxdepth

```

\vsize initialized because a \clearpage with \vsize < \topskip causes trouble.
\@colroom and \@colht also initialized because \vsize may be set to them if a \clearpage is done before the \begin{document}

```

153 \vsize = 1000pt
154 \@colroom = \vsize
155 \@colht = \vsize

```

Initialise \textheight \textwidth and page style, to avoid internal errors if they are not set by the class.

```

156 \textheight=.5\maxdimen
157 \textwidth=\textheight
158 \ps@empty

```

1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only \lccode but also other related data. The \lccode part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide \Umathcode.

```

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
224 \\lccode`\\- ='\\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
225 \\else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \\reserved@a to apply \\reserved@c to all the numbers in the range of its arguments.

```

226 \\def\\reserved@a#1#2{%
227   \\@tempcnta#1\\relax
228   \\@tempcntb#2\\relax
229   \\reserved@b
230 }
231 \\def\\reserved@b{%
232   \\ifnum\\@tempcnta>\\@tempcntb\\else
233     \\reserved@c\\@tempcnta
234     \\advance\\@tempcnta\\@ne
235     \\expandafter\\reserved@b
236   \\fi
237 }

```

Depending on the T_EX version, we might not be allowed to do this for non-ASCII characters.

```

238 \\def\\reserved@c#1{%
239   \\count@=#1\\advance\\count@ by -"20
240   \\uccode#1=\\count@
241   \\lccode#1=#1
242 }

```

```

243 \reserved@{\`a}{\`z}
244 \reserved@{"AO}{ "BC}
245 \reserved@{"E0}{ "FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcodes` set to 999.

```

246 \def\reserved@c#1{%
247   \count@=\#1\advance\count@ by "20
248   \uccode#1=\#1
249   \lccode#1=\count@
250   \sfcodes#1=999
251 }
252 \reserved@{\`A}{\`Z}
253 \reserved@{"80}{ "9C}
254 \reserved@{"C0}{ "DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

255 \uccode`^Y=\`I      % dotless i
256 \lccode`^Y=\^Y     % dotless i
257 \uccode`^Z=\`J      % dotless j, ae in OT1
258 \lccode`^Z=\^Z     % dotless j, ae in OT1
259 \lccode`^9d=\`i     % dotted I
260 \uccode`^9d=\^9d   % dotted I
261 \lccode`^9e=\^9e   % d-bar
262 \uccode`^9e=\^d0   % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

263 \lccode`^=[\^[\% oe in OT1

```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```

264 \lccode`\- =`\-    % default hyphen char
265 \lccode 127=127    % alternate hyphen char
266 \lccode 23 =23     % textcompwordmark in T1

```

End of the conditional to select either Unicode or T1 encoding defaults.

```

267 \fi

```

At this stage, we can install any last-minute `expl3` set-up.

```

268 \Oexpl@finalise@setup@@
269 \def\@expl@finalise@setup@@{}}

```

This is as good a place as any to active a few XeTeX-specific settings

1.6 Input encoding

Starting with the 2018 L^AT_EX release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, encTeX or mltex.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

346 </2ekernel>
347 <*2ekernel | latexrelease>

```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```

500 }
```

Set the special catcodes (although some of these are useless, since an error will have occurred if the catcodes have changed). Note that `^J` has catcode ‘other’ for use in warning messages.

```
501 \catcode`\ =10
502 \catcode`\#=6
503 \catcode`\$=3
504 \catcode`\%=14
505 \catcode`\&=4
506 \catcode`\\=0
507 \catcode`\^=7
508 \catcode`\_=8
509 \catcode`\{=1
510 \catcode`\}=2
511 \catcode`\-=13
512 \catcode`\@=11
513 \catcode`\^^I=10
514 \catcode`\^^J=12
515 \catcode`\^^L=13
516 \catcode`\^^M=5
```

Set the ‘other’ catcodes.

```
517 \def\reserved@c#1{\catcode#1=12\relax}
518 \reserved@cf`\'!
519 \reserved@cf`\""
520 \reserved@cf`\'?}
521 \reserved@cf`\'[}
522 \reserved@cf`\']}
523 \reserved@cf`\'`}
524 \reserved@cf`\'|}
```

Set the ‘letter’ catcodes.

```
525 \def\reserved@c#1{\catcode#1=11\relax}
526 \reserved@af`\'A}{\'Z}
527 \reserved@af`\'a}{\'z}
```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab (`^I`), nl (`^J`), ff (`^L`) and cr (`^M`).

1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their \uccode and \lccode values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the TeX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeTeX and LuaTeX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

528 \ifnum 0%
529   \ifx\Umathcode\@undefined\else 1\fi
530   \ifx\XeTeXmathcode\@undefined\else 1\fi
531   >\z@
532 \else
533   \def\reserved@c#1{%
534     \count@=#1\advance\count@ by -"20
535     \uccode#1=\count@
536     \lccode#1=#1
537   }
538   \reserved@a{\a}{\z}
539   \reserved@a{"A0}{ "BC}
540   \reserved@a{"E0}{ "FF}

```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```

541 \def\reserved@c#1{%
542   \count@=#1\advance\count@ by "20
543   \uccode#1=#1
544   \lccode#1=\count@
545   \sfcode#1=999
546 }
547 \reserved@a{\A}{\Z}
548 \reserved@a{"80}{ "9C}
549 \reserved@a{"C0}{ "DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

550 \uccode'`^Y='`I      % dotless i
551 \lccode'`^Y='`^Y    % dotless i
552 \uccode'`^Z='`J      % dotless j, ae in OT1
553 \lccode'`^Z='`^Z    % dotless j, ae in OT1
554 \lccode'`^9d='`i     % dotted I
555 \uccode'`^9d='`^9d  % dotted I
556 \lccode'`^9e='`^9e  % d-bar
557 \uccode'`^9e='`^d0  % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

558 \lccode'`^^[='`^^[  % oe in OT1
559 \fi % End of reset block for 8-bit engines

```

\BCPdata A stub for use by babel, polyglossia, etc.

```

560 \ExplSyntaxOn
561 \newcommand*\BCPdata[1]{
562   \str_case:nn {#1}
563   {
564     { language } { en }

```

```

565     { region }   { US }
566     { script }   { Latn }
567     { tag }       { en-US }
568   }
569 }
570 \ExplSyntaxOff

```

(End of definition for \BCPdata.)

1.8 Case changing

```

\MakeUppercase
\MakeLowercase
\MakeTitlecase
\NoCaseChange
\AddToNoCaseChangeList
  \CaseSwitch
\DeclareCaseChangeEquivalent
  \DeclareLowercaseMapping
  \DeclareTitlecaseMapping
  \DeclareUppercaseMapping
    \cuclist

```

And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

Wrappers around the L3 case changing functions. \protected to make them mostly safe as replacements for uppercase and \lowercase.

In

```

\markboth{\MakeUppercase\contentsname}
         {\MakeUppercase\contentsname}

```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```

\mark{\MakeUppercase Table of Contents}
      {\MakeUppercase Table of Contents}

```

In order to get round this, we redefine \MakeUppercase and \MakeLowercase to grab their argument and brace it.

Earlier versions needed to process \cuclist in an \edef to handle legacy input encodings, but recent (2022) expl3 versions handle non-UTF8 text natively so we simply call the \text_case:n functions.

```

571 \ExplSyntaxOn
572 \keys_define:nn { __kernel }
573   {
574     lang .str_set:N = \reserved@a ,
575     locale .str_set:N = \reserved@a ,
576     words .choices:nn =
577       { all , first }
578       { \str_set:Nn \reserved@b {#1} }
579   }
580 \cs_new_protected:Npn \@@text@case@aux #1#2#3
581   {

```

1.10 Freeing Memory

\reserved@a And just to make sure nobody relies on those definitions of **\reserved@b** and friends.
\reserved@b These macros are reserved for use in the kernel. *Do not use them as general scratch macros.*

```

698 \let\reserved@a\@filelist
699 \let\reserved@b=\@undefined
700 \let\reserved@c=\@undefined
701 \let\reserved@d=\@undefined
702 \let\reserved@e=\@undefined
703 \let\reserved@f=\@undefined

```

(End of definition for **\reserved@a** and **\reserved@b**.)

\toks

```

704 \toks0{}
705 \toks2{}
706 \toks4{}
707 \toks6{}
708 \toks8{}

```

(End of definition for **\toks**.)

\errhelp Empty the error help message, which may have some rubbish:

```
709 \errhelp{}
```

(End of definition for **\errhelp**.)

1.11 Initialise file list

- \@providesfile Initialise for use in the document. During initex a modified version has been used which leaves debugging information for `latexbug.tex`.

```
710 \def\@providesfile#1[#2]{%
711   \wlog{File: #1 #2}%
712   \expandafter\xdef\csname ver@#1\endcsname{#2}%
713 }
```

(End of definition for `\@providesfile`.)

- \@filelist \@addtofilelist Reset `\@filelist` so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any L^AT_EX command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
714 \let\@filelist\gobble
715 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

(End of definition for `\@filelist` and `\@addtofilelist`.)

1.12 Preparation for supporting PDF in backends

At the current point in time, basic support for PDF in backends is not part of L^AT_EX core; it is provided by external packages. At some time in the future that work will be placed into the kernel but for now it is separate and has to be explicitly loaded in the document.

In that code there is a command `\IfPDFManagementActiveTF` which can be used by packages in order to execute different code depending on the whether this basic backend support is loaded.

To make this also work properly when this external package is not loaded at all, we here add this command already in the kernel (with a trivial definition); thus any package can query this loading state in all circumstances. Once this basic PDF backend support gets moved to the kernel, this definition will vanish again from here or, rather, it will be replaced by a real test.

- \IfPDFManagementActiveTF So long as the code for the basic backend support for PDF is not loaded, the test that is implicit here will always return the false branch. Once this code is loaded, this definition will get replaced by a real test (as it is then possible that the management code is either activated or not activated).

```
716 \let \IfPDFManagementActiveTF \@secondoftwo
```

(End of definition for `\IfPDFManagementActiveTF`.)

1.13 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

1.14 Some last minute initializations ...

Load the first aid set of definitions for external packages that await updates.

```
717 \Qinput{latex2e-first-aid-for-external-files.ltx}
```

1.15 Dumping the format

Finally we make @ into a letter, ensure the format will be in the ‘normal’ error mode, and dump everything into the format file.

```
718 \makeatother
719 \errorstopmode
720 \dump
721 </2ekernel>
```

Change History

1985-11-04 ltmath.dtx LaTeX2.09		\mathversion: Test if version defined added.	546
General: produce warning message if line extends into margin. Doesn't warn about formula overprinting equation number.	854		
1989-04-10 ltfssbas.dtx v1.0a			
General: Starting with version numbers! \ifmmode added in \math@group	533		
1989-04-10 ltfssbas.dtx v1.0b			
General: \preload@sizes added.	533		
\wrong@fontshape changed to define substitution font/shape macro.	533		
1989-04-10 ltfssini.dtx v1.0a			
General: Starting with version numbers \newif for \@tempswa added since this switch is unknown at the time when this file is read in. (latex.tex is loaded later.) \math@famname changed to \math@version.	695		
1989-04-14 ltfssbas.dtx v1.0c			
General: More documentation added.	533		
1989-04-15 ltfssini.dtx v1.0b			
General: \mathfontset renamed to \mathversion.	695		
1989-04-19 ltfssbas.dtx v1.0d			
General: Even more doc.	533		
1989-04-21 ltfssbas.dtx v1.0e			
General: Documentation is fun! Parameters of \define@mathalphabet changed.	533		
1989-04-21 ltfssini.dtx v1.0c			
General: Changed to conform to fam.tex.	695		
1989-04-23 ltfssbas.dtx v1.0f			
General: % in \getanddefinefonts added.	533		
1989-04-26 ltfssini.dtx v1.0d			
General: \xpt added.	695		
1989-04-27 ltfssbas.dtx v1.0g			
General: Documentation revised.	533		
1989-04-27 ltfssini.dtx v1.0e			
General: Definitions of L ^A T _E X symbols corrected.	695		
1989-04-29 ltfssbas.dtx v1.0h			
General: Documented problem with \halign, and \noalign	533	\mathversion: Test if version defined added.	546
		General: Removed the \halign \noalign correction (wasn't bugfree)	533
		General: Corrections to L ^A T _E X tabular env. added.	695
		General: Default for \baselinestretch added.	533
		General: Lines longer than 72 characters folded.	533
		General: Lines shortened to 72 characters	695
		General: Global replacement: \group to \mathgroup	533
		\mathversion: Corrected typo: \endscname to \endcsname.	546
		General: All family, series, and shape names abbreviated.	695
		General: First parameter of \define@mathalphabet and \define@mathgroup changed from string to control sequence.	533
		\mathversion: Math version prefix 'mv@' added.	546
		\define@newfont: Group added.	549
		\wrong@fontshape: Instead of calling \family\default@family, etc. we directly set \f@family, etc.	554
		\mathversion: \def → \edef for \mathversion.	546
		General: All \edef\font@name changed to \xdef\font@name. Necessary after introduction of \begingroup/\endgroup in v1.0q.	533
		extra// → + in \extra@def.	533

1989-11-26 ltfssbas.dtx v1.0t \select@group: \bgroup/\egroup changed to \begingroup/\endgroup to avoid empty Ord atom on math list.	557	1990-01-25 ltfssini.dtx v1.1e \nfss@text: Macro added.	718
1989-12-02 ltfssini.dtx v1.1b General: \rmmath renamed to \mathrm	695	1990-01-27 ltfssbas.dtx v1.2d \DeclarePreloadSizes: Font identifier set to \relax.	541
1989-12-03 ltfssini.dtx v1.1c General: Some internal macros renamed to make them inaccessible.	695	1990-01-28 ltfssbas.dtx v1.2e \mathgroup: \newfam let to \new@mathgroup.	533
1989-12-05 ltfssbas.dtx v1.0u \addto@hook: \addto@hook added.	561	1990-01-28 ltfssbas.dtx v1.2f \define@newfont: Added call to \curr@fontshape macro to allow substitution.	550
1989-12-05 lfsstrc.dtx v1.0u fam.dtx \every@math@size: Hook \every@size added.	642	\wrong@fontshape: Warning message slightly changed.	554
1989-12-13 lfsstrc.dtx v1.0f \use@mathgroup: \expandafter added before final \fi.	645	1990-01-28 ltfssini.dtx v1.2b \em: Call to \nomath added.	715
1989-12-16 ltfssbas.dtx v1.1a \select@group: \relax in front added.	557	1990-02-08 ltfssini.dtx v1.1g General: Protected the commands \fam, \series, \shape, \size, \selectfont, and \mathversion.	695
Now four arguments.	557	1990-02-16 ltfssbas.dtx v1.2g General: Support for changes of \baselineskip without changing the size.	533
Redefinition of alphabet now simpler.	557	\mathversion: \nomath added.	546
Usage of '=' macro added.	557	1990-02-18 lfsstrc.dtx v1.0j \selectfont: Redefine unprotected version \p@selectfont instead of \selectfont.	637
1989-12-16 lfsstrc.dtx v1.1a \selectfont: Changed order of calls.	637	1990-03-14 lfsstrc.dtx v1.0k General: Added code for TeX3.	633
\use@mathgroup: Redefinition of alphabet now simpler.	644	\extract@font: Added code for TeX3.	636
Usage of '=' macro added.	644	1990-03-30 ltfssbas.dtx v1.2h \math@egroup: Changed to have one arg.	559
1990-01-18 lfsstrc.dtx v1.0h General: \tracingfonts meaning changed.	633	1990-03-30 lfsstrc.dtx v1.2h \use@mathgroup: Third argument removed (see \math@egroup).	644
1990-01-20 ltfssbas.dtx v1.2a \math@bgroup: Def. placed in this file.	559	1990-04-01 ltfssbas.dtx v1.2i General: Code added from tracefn.ttx.	533
\math@egroup: Def. placed in this file.	559	Support for TeX3.	533
\select@group: Def for alph id changed.	557	1990-04-01 lfsstrc.dtx v1.0l General: Part of code moved to fam.dtx.	633
1990-01-21 ltfssbas.dtx v1.2b \select@group: Code moved to \use@mathgroup.	557	\tracingfonts: Check if \tracingfonts already defined.	634
1990-01-21 lfsstrc.dtx v1.2b \use@mathgroup: Macro added to allow cleaner interface.	644	1990-04-01 lfsstrc.dtx v1.0o \tracingfonts: Check if \tracingfonts defined removed again.	634
1990-01-23 ltfssbas.dtx v1.2c General: \no@version@warning renamed to \no@alphabet@error.	533		
Macro \no@alphabet@help added	533		
\no@alphabet@error: Changed to error call	533		

1990-04-02 ltfssini.dtx v1.1i General: \input of files now handled by docstrip.	695	1991-08-14 ltpictur.dtx LaTeX2.09 General: (RmS) inserted extra braces around entry for NFSS	927
1990-04-05 lfsstrc.dtx v1.0m \selectfont: Call \tracingon only if \tracingfonts greater than 3.	637	1991-08-14 ltthm.dtx LaTeX2.09 \endtheorem: Moved \itshape after \item to make it work with NFSS	957
1990-05-05 lfsstrc.dtx v1.0n \selectfont: \tracingon with new syntax.	637	1991-08-26 ltfssini.dtx v1.1n \reset@font: Macro introduced	718
1990-06-23 ltfssini.dtx v1.1k \nfss@text: Changed to \mbox.	718	1991-08-26 ltmiscen.dtx LaTeX2.09 \overline: \@par added	837
1990-06-24 ltfssbas.dtx v1.2j \DeclarePreloadSizes: Missing percent added.	541	1991-08-26 ltpictur.dtx LaTeX2.09 \endpicture: (RmS & FMi) extra boxing level around \picbox to guard against unboxing in math mode (proposed by John Hobby)	925
1990-06-24 lfsstrc.dtx v1.0o \baselinestretch: Moved to tracefnt.dtx.	642	1991-08-26 ltplain.dtx LaTeX209 \tracingall: Added \errorcontextlines=\maxdimen, suggested by J. Schrod	33
\getanddefine@fonts: \Adding tracing code.	646	1991-09-29 ltboxes.dtx LaTeX2.09 \@mpfootnotetext: (RmS) added \reset@font	892
\Macro moved from fam.dtx.	645	1991-09-29 ltfloat.dtx LaTeX2.09 \footnotetext: (RmS) added \reset@font	991
Adding debug code.	646	1991-09-29 ltmath.dtx LaTeX2.09 \@eqnnum: RmS: \reset@font added.	853
\use@mathgroup: Tracing code added.	645	1991-09-29 ltsect.dtx LaTeX2.09 \@dottedtocline: (RmS) added \reset@font for page number	970
1990-06-30 ltfssbas.dtx v1.2l \showhyphens: Macro added.	560	1991-10-17 ltcntrl.dtx LaTeX209 \@tfor: (Rms) \xdef replaced by \def (See FMi's array.doc)	396
1990-06-30 lfsstrc.dtx v1.0p \use@mathgroup: Added \relax after math group number.	645	1991-10-25 ltbibl.dtx LaTeX2.09 \citex: added \reset@font, suggested by Bernd Raichle.	1000
1990-07-07 lfsstrc.dtx v1.0q \getanddefine@fonts: Group number added to tracing.	646	1991-11-01 ltfloat.dtx LaTeX2.09 \footnote: (RmS) Added \let\protect\noexpand in \footnote, \footnotemark, and \footnotetext, since \xdef is used	991
\math@egroup: Tracing code added.	645	1991-11-04 ltlists.dtx LaTeX2.09 \makelabel: (RmS) added default definition for \makelabel, to produce an error message.	874
\use@mathgroup: Group number added to tracing.	645	1991-11-04 ltplain.dtx RmS General: Removed \itemitem since never needed/useful with L ^A T _E X.	31
1990-08-27 lfsstrc.dtx 1.0r \type@restoreinfo: Some extra tracing info.	641	1991-11-06 ltbibl.dtx LaTeX2.09 \citex: added code to remove a leading blank	1000
1990-08-27 lfsstrc.dtx v1.0r \getanddefine@fonts: Correcting missing name after \tracingon.	646		
1991-03-28 ltfssini.dtx v1.1m \copyright: Extra braces added.	718		
1991-03-30 ltfssini.dtx v1.2g \newfont: Definition added.	717		
\symbol: Definition added.	717		
1991-07-24 ltmiscen.dtx LaTeX2.09 \verbatim: Added			
\penalty\interlinepenalty to definition of \par so that \samepage works	837		
1991-08-14 ltmath.dtx LaTeX2.09 \cases: (RmS) inserted extra braces around entry for NFSS	848		

1991-11-13	ltbibl.dtx	LaTeX2.09		avoid conflicts with other channels allocated by \newread	82
	\@bibitem:	Changed counter enumi to enumiv, as it says in the comment above	999		
1991-11-21	ltfssini.dtx	v1.10		\@xmpar: (RmS) added \global\@ignorefalse	986
	\reset@font:	Added extra braces for robustness.	718	\end@float: (RmS) changed \@esphack to \@Espack	980
		Changed to protected version of macro.	718		
1991-11-22	ltfloat.dtx	LaTeX2.09		1992-03-18 lftlists.dtx 0.0 \trivlist: RmS: added \nmbrrlistfalse	869
	\footnote:	(RmS) Added \let\protect\noexpand in \xfootnote, \xfootnotemark, and \xfootnotetext	991	1992-03-18 ltmiscen.dtx LaTeX2.09 \begin: Changed \@ignoretrue to \@ignorefalse (as documented)	828
1991-11-22	ltlists.dtx	LaTeX2.09		1992-03-21 ltfssini.dtx v1.2d General: Renamed \text to \nfss@text to make it internal.	695
	\@item:	(RmS) Changed second call to \makelabel to \unhbox\@tempboxa. Avoids problems with side effects in \makelabel and is more efficient.	874	1992-05-12 ltfssbas.dtx v1.3c \extract@alph@from@version: Macro added.	558
1991-11-27	ltfssbas.dtx	v1.3a		\select@group: Added call to \extract@alph@from@version.	557
	General:	All \family, \shape etc. renamed to \fontfamily etc. . . .	533	1992-07-26 ltfssbas.dtx v1.9a \curr@fontshape:	549
1991-11-27	ltfssini.dtx	v1.2a		\DeclareFontShape: Introduced \DeclareFontShape	534
	General:	All \family, \shape etc. renamed to \fontfamily etc. . . .	695	\define@newfont:	549
1992-01-06	ltfssini.dtx	v1.2c		\math@fonts:	556
	General:	added slitex code	695	\select@group:	557
1992-01-10	ltbibl.dtx	LaTeX2.09		\split@name: Added splitting into \f@encoding.	549

1992-01-14	ltsect.dtx	0.0		1992-08-14 ltbibl.dtx LaTeX2.09 \@citex: added missing argument braces around \hbox, found by Ed Sznyter	1000
	\@starttoc:	(RmS) added \immediate to \openout as all \write commands are also executed \immediate	967	1992-08-14 ltboxes.dtx LaTeX209 \endminipage: (RmS) replaced \vskip-\lastskip by \unskip (proposed by FMI)	892
1992-02-26	ltbibl.dtx	LaTeX2.09		1992-08-17 ltbibl.dtx LaTeX2.09 \@citex: simplified code for removing leading blanks in citation key (proposed by Frank Jensen and Kresten Krab Thorup)	1000
	\@lbibitem:	Added \hfill to restore left-alignment of bibliography labels in alpha style	999	1992-08-19 ltsect.dtx 0.0 \@xsect: (RmS) corrected bug: stretch and shrink in argument to \hskip	
1992-03-18	ltdefns.dtx	LaTeX209			
	General:	(RMS) changed input channel from 0 to \inputcheck to			

previously not negated	963	\footnote: (RmS) Changed all to ‘def’protect’noexpand’protect’noexpand	991
1992-08-19 ltthm.dtx LaTeX2.09			
\@othm: (RmS) Changed error message to complain about undefined counter	956		
1992-08-20 ltfssini.dtx v1.4b			
\@setsizE: Added \currsize.	717	\hexnumber@: Make it accept counters.	718
1992-08-24 ltdefns.dtx LaTeX209			
\@ifnextchar: (Rms) \@ifnextchar didn’t work if its first argument was an equal sign.	107	1993-03-08 preload.dtx v2.0b General: Added 12pt preloads	744
1992-08-24 ltmiscen.dtx LaTeX2.09			
\begin: Added code to \begin to remember line number. Used by \@badend to display position of non-matching \begin.	828	1993-03-18 ltfssbas.dtx v2.0c General: Changed all \tempdima in \tempdimb to avoid killing \numberline	533
1992-08-25 ltsect.dtx LaTeX2.09			
\@sect: (FMi) replaced explicit setting of \svsec by call to \seccntformat	962	1993-03-18 lfsstrc.dtx v2.1b General: Changed all \tempdima in \tempdimb to avoid killing \numberline	633
1992-09-18 ltlists.dtx LaTeX2.09			
\item: (RmS) Added warning if \item is used in math mode	872	Changed all \tempdimb in \tempdimx to avoid killing \numberline	633
1992-09-18 ltab.dtx LaTeX2.09			
\array: Changed \par to \empty to avoid starting new row e.g. after \hline	910	1993-03-18 lfsstrc.dtx v2.1c \DeclareSizeFunction: Added all args to avoid blanks problems . . .	651
1992-09-19 lfsstrc.dtx v2.0c			
\try@simple@size:	648	1993-04-09 lterror.dtx v1.0e \@latexerr: Mention The Companion	403
1992-09-21 ltfssini.dtx v1.4d			
\not@math@alphabet: Macro defined.	716	1993-04-11 lterror.dtx v1.0f \@latexerr: Remove setting of errorcontextlines	403
1992-09-22 ltfssbas.dtx v1.91a			
General: Introduced \tf@size for math size.	533	1993-05-05 lfntcmd.dtx v2.0b General: Removed all LaTeX related cmds	747
1992-09-22 lfsstrc.dtx v2.1a			
\getanddefine@fonts: Introduced \tf@size for math size.	646	1993-05-16 ltfssbas.dtx v2.0e \showhyphens: Use \reset@font . . .	560
1992-11-13 ltfssini.dtx v?			
\hexnumber@: Made expandable.	718	1993-07-16 lfsstrc.dtx v2.1h General: Changed layout of info messages	633
1992-11-23 ltcounds.dtx LaTeX209			
\stepcounter: Replaced {} in \stepcounter by \begingroup \endgroup to avoid adding an empty ord in math mode	523	1993-07-17 ltoutenc.dtx 1.0d General: changed \catcoding @ . . .	478
1992-11-26 ltboxes.dtx LaTeX2.09			
\@mpfootnotetext: (RmS) added protection for \edef	892	1993-08-03 ltmiscen.dtx LaTeX2.09 \enddocument: Changed redefinition of \global to redefinition of \@setckpt.	820
1992-11-26 lfloat.dtx LaTeX2.09			
\@footnotetext: (RmS) added protection for \edef	991	1993-08-05 ltpictur.dtx LaTeX2.09 \circle: (RMS) Added error message if \circle is used in math mode.	947
		1993-08-05 ltsect.dtx LaTeX2.09 \@sect: (RmS) Made sure that \protect works correctly in expansion of \the counter	962
		1993-08-05 ltspace.dtx LaTeX2e \@hspacE: (RmS) Removed superfluous \leavevmode in \hspace and \hspacer, as suggested by CAR.	448

1993-08-05 lttab.dtx latex2e	\everycr	927
\tabular*: Replaced \expandafter\def by \cnamedef.	909	
1993-08-06 ltbibl.dtx LaTeX2.09		
\citet: Moved writing to .aux file in loop over citation keys so that leading blanks are removed there as well.	1000	
1993-08-13 ltoutenc.dtx 1.0f		
General: Protected against active @ sign.	478	
1993-08-13 preload.dtx v2.0c		
General: Added \relax at end of font names.	745	
1993-08-16 ltoutenc.dtx 1.0g		
General: Needs space after \string	478	
1993-08-18 ltfsdcl.dtx v2.0e		
\new@mathversion: Exchanged names of encodings in warning message of \SetSymbolFont.	676	
1993-09-02 ltfsstrc.dtx v2.1i		
General: Corrected name of sgen size function.	633	
1993-09-03 ltmiscen.dtx LaTeX2.09		
\verbatim@nolig@list: Replaced \@noligs by extensible list	842	
1993-09-07 ltmiscen.dtx LaTeX2.09		
\verb@balance@group: (RmS) Changed definition of \verb so that it detects a missing second delimiter.	842	
1993-09-08 ltmiscen.dtx LaTeX2.09		
\enddocument: Added warning in case of undefined references.	820	
1993-09-15 ltfsbas.dtx v2.0g		
\DeclareFontEncoding: Corrected: \defaultOT to \defaultOM.	537	
1993-09-15 ltfsstrc.dtx v2.1j		
General: Corrected spelling of \noxpand.	633	
1993-09-19 lterror.dtx LaTeX2.09		
\@invalidchar: (RmS) Error message for invalid input characters.	407	
1993-11-02 ltmath.dtx LaTeX2.09		
General: RmS: Corrected description of \eqnse1, moved \eqnse1 accordingly and removed extra \tabskip assignment.	854	
1993-11-03 ltmath.dtx LaTeX2e		
General: RmS: Initialized \everycr to empty	854	
1993-11-03 ltpictur.dtx LaTeX2.09		
General: (RmS) changed \halign to \ialign to initialize \tabskip and		
	\everycr	927
	\normalfont: Macro added	718
	General: Option concept added for LaTeX2e	633
	\currext: Name changed from \@currextension	1043
	\@reset@ptions: macro added ...	1071
	\AtEndDocument: Included extension in the generated macro name for package and class hooks.	1071
	\documentstyle: Added \RequirePackage \@unusedoptionlist stuff.	1059
	\load@onefilewithoptions: Moved resetting of \default@ds, \ds@ and \@declaredoptions here, from the end of \ProcessOptions.	1065
	\NeedsTeXFormat: made more robust for alternative syntax for other formats.	1061
	\ProcessOptions*: Optimize ‘empty option’ code.	1056
	Stop adding the global option list inside class files.	1056
	\g@addto@macro: Made global	112
	\documentstyle: Modified to match \ProcessOption*	1059
	\ProcessOptions*: Star form added.	1056
	\load@onefilewithoptions: Added trap for two \LoadClass commands.	1067
	\NeedsTeXFormat: Name changed from \NeedsFormat	1061
	\ProcessOptions*: restoring \@fileswith@ptions added. ...	1056
	\documentstyle: Modified \RequirePackage stuff.	1059

\enddocument: Hook added	General: Removed setting \errorcontextlines (now in latex.tex)	1042
1993-12-10 ltoutenc.dtx v1.2	\documentstyle: compatibility file now latex209.sty.	1059
General: Added source code for t1enc.sty.	\usepackage: Fixed error handling . . .	1061
1993-12-11 lfntcmd.dtx v3.0a	1993-12-13 ltdirchk.dtx v0.2a	
General: Complete reworking of all text commands, using just one creator function	General: on the ‘docstrip’ pass, do not check openin path	10
italic correction now put in front of penalty before glue	\IfFileExists: Removed interactive prompting for current directory syntax	10
newcommands replaced by defs	\strip@prefix: modified, name changed from \stripmeaning.	5
newfontswitch command corrected and changed	1993-12-13 ltlists.dtx latex2e	
\DeclareTextFontCommand: Macro changed	\trivlist: Initialised \@itemlabel . . .	869
\emph: Macro changed	1993-12-13 ltmiscen.dtx v0.9h	
	\@noligs: Readded \@noligs	843

\@verbatim: Readded \onoligs	837	1993-12-17 ltoutenc.dtx 1.3
Removed optional argument of \item	837	General: Added this section
center: Removed optional argument of \item	834	479 Removed all the hackery for use in \DeclareFontEncoding, and redid everything using \DeclareTextFoo.
flushleft: Removed optional argument of \item	835	491, 494 Removed the catcode hackery, since the file is only read as a package in the preamble, and removed all the messages on the screen, which just confuse users. Replaced them by the appropriate \ProvidesPackage commands. Added XXXenc.
1993-12-13 ltoutenc.dtx v1.2b		478
General: Corrected file name in driver code.	475	
1993-12-13 lttab.dtx latex2e		
\tabbing: Removed optional argument of \item	904	1993-12-17 ltoutenc.dtx v1.3
1993-12-14 ltoutput.dtx v1.0i		General: Added
General: Section added to declare all parameters	1239	\EncodingSpecificAccent, \EncodingSpecificAccentedLetter and \EncodingSpecificCommand.
1993-12-15 ltboxes.dtx v0.1d		475 Made Rokicki's encoding a proper encoding scheme rather than a variant of OT1.
\iminipage: Changed default from 'c' to 's'	891	1993-12-17 ltoutput.dtx v1.0j
\iparbox: Changed default from 'c' to 's'	888	\opcol: Hook removed
\minipage: Changed default from 'c' to 's'	891	1177 \specialoutput: Page room test added
extra space removed.	891	1172 \topnewpage: check for vsize too small added
\parbox: Changed default from 'c' to 's'	888	1167 Page room test added
1993-12-15 ltclass.dtx v0.2p		1169 \writesetup: —and then removed
General: Removed extra 's' from \@warnings	1042	1188 \ftrace: tracefloatvals made a document command
1993-12-16 ltlogos.dtx LaTeX2e		1226 1993-12-17 ltpage.dtx LaTeX2e
\LaTeXe: Extended logo by DPC	450	\mark: Removed init \mark at begin document, since it doesn't work.
1993-12-16 ltmath.dtx v0.9i		1036 \rightmark: Stopgap solution to mark \leftmark and \rightmark work without initializing mark until the problem is solved.
\eqncr: use \refstepcounter instead of shortcut	855	1036
General: use \refstepcounter instead of shortcut	854	
1993-12-16 ltmiscen.dtx v0.9i		1993-12-18 ltoutenc.dtx 1.3b
General: \literal added	843	General: Fixed typos with \ProvidesPackage lines. Added the \NeedsTeXFormat line. Added the last argument to \DeclareEncoding. Moved the use of the encodings to after their declaration.
1993-12-16 ltpage.dtx LaTeX2e		478 Replaced the missing last argument to \DeclareFontEncoding.
\mark: Init \mark at begin document	1036	491, 494
1993-12-16 ltspace.dtx LaTeX2e		
\bsphack: Corrected optimisation	437	1993-12-18 ltoutenc.dtx 1.3c
1993-12-16 lttab.dtx latex2e		General: Rewrote for the new syntax of \EncodingSpecific.
\xhline: Measure from middle of vertical rules	919	491, 494 Split \EncodingSpecific up into \EncodingSpecific and \DeclareAccent.
1993-12-17 ltclass.dtx v0.2q		479
\documentclasshook: Macro added	1042	
\fileswithoptions: Add \compatibility hook	1063	
\documentstyle: Match Alan's new code.	1059	

1993-12-18 ltoutenc.dtx v1.3a		1994-01-14 ltdirchk.dtx v0.2d
General: Replaced OT3 by XXX . . .	475	\IfFileExists: Close the texsys.aux output stream
1993-12-18 ltoutenc.dtx v1.3b		1994-01-15 lfiles.dtx v0.9o
General: Corrected typos.	475	\document: move \@preamblecmds after document hook
Replaced the missing last argument to \DeclareFontEncoding.	475	1994-01-17 ltclass.dtx v0.2s
1993-12-18 ltoutenc.dtx v1.3c		\@fileswithoptions: Modify to reduce parameter stack usage
General: A new syntax, separating accent-definitions from encoding-specific definitions, and allowing encoding-specific \chardef, \let, etc.	475	General: Added many more \@onlypreamble commands
Rewrote for the new syntax of \EncodingSpecific.	475	Wrapped long lines to column 72
1993-12-18 ltoutenc.dtx v1.3d		\load@onefile@withoptions: Modify to reduce parameter stack usage
General: Some T1 stuff had drifted into the OT1 file.	475	1994-01-17 lfiles.dtx LaTeXe
1993-12-18 ltpage.dtx LaTeXe		\listfiles: New Version, adds ‘.tex’ if needed, and lines up columns
\sloppy: Added \emergencystretch	1037	1994-01-17 ltfssbas.dtx v2.1a
1993-12-19 ltclass.dtx v0.2r		General: New math font setup
\endfilecontents: Different message when ignoring a file	1074	\curr@math@size: New math font setup
1993-12-19 lftntcmd.dtx v3.0b		\everydisplay: New math font setup
General: \opdef command added	747	\everymath: New math font setup
Added by ASAJ.	755	\frozen@everydisplay: New math font setup
Made \newfontswitch produce an error if command already exists, and added \renewfontswitch, ASAJ	747	\frozen@everymath: New math font setup
Other tidying	747	\math@version: New math font setup
Some more tidying done	747	1994-01-17 ltfssini.dtx v2.1e
Untidying added, so this is now a TEMPORARY version.	747	\not@math@alphabet: Message changed
Wording changes by CAR.	755	1994-01-17 lfsstrc.dtx v2.3a
\DeclareOldFontCommand: Corrected and tidied	754	General: New math font setup
\DeclareTextFontCommand: Corrected and tidied	749	\check@mathfonts: New math font setup
1993-12-19 ltspace.dtx LaTeXe		\glb@currsize: New math font setup
\bsphack: There seem to be problems with selfmade birthday presents	438	\restglb@settings: New math font setup
1993-12-20 ltdefns.dtx LaTeXe		1994-01-18 ltbibl.dtx LaTeXe
\reargdef: Kept old version of \reargdef, for array.sty	85	\bibliography: Use \input@ so include files are listed.
1993-12-20 lfiles.dtx v0.9m		1994-01-18 ltclass.dtx v0.2t
\obsoletefile: Added this command, removed @oldfilewarning	472	\ifclassloaded: Fix typo \pkgetension
1994-01-05 fontdef.dtx v2.1d		1994-01-18 lfilehook.dtx v0.9p

General: Added some warnings when page gets full of top floats.	1152	1994-03-29 ltcounds.dtx v1.0c General: Create file from parts of ltmiscen and ltherest.	521
Driver added and further tidying.	1152	1994-03-29 ltlength.dtx v1.0c General: Create file ltcntlen from parts of ltmiscen and ltherest.	531
Removed duplicated code and corrected docstrip options.	1152	1994-03-29 ltmiscen.dtx v1.0d General: Remove counter macros to ltcntlen	819
Some boxmaxdepth settings removed.	1152	1994-03-29 ltpageno.dtx v1.0c General: Create file ltcntlen from parts of ltmiscen and ltherest.	796
1994-03-16 ltclass.dtx v0.3f General: Add pkgindoc package	1090	1994-03-29 ltxref.dtx v1.0c General: Create file ltcntlen from parts of ltmiscen and ltherest.	797
1994-03-16 ltfiles.dtx LaTeXe \listfiles: Move this code directly into \document	473	1994-03-31 ltbibl.dtx v1.0a General: Initial version of ltidxbib.dtx, split from ltherest.dtx	998
1994-03-16 ltfiles.dtx v1.0c \document: (DPC) directly add file list settings	455	1994-03-31 ltidxglo.dtx v1.0a General: Initial version of ltidxbib.dtx, split from ltherest.dtx	995
1994-03-16 ltmiscen.dtx v1.0b \verb@: Remove \global@\inlabelfalse again.	837	1994-04-09 ltcounds.dtx v1.0d \newctr: \nocntr now has counter name argument	523
1994-03-28 ltalloc.dtx v1.0d General: Redefinition of 'new' allocations removed.	391	\addtocounter: \nocntr now has counter name argument	522
1994-03-28 ltdirchk.dtx v1.0d General: Improve documentation	1	\setcounter: \nocntr now has counter name argument	522
1994-03-28 lterror.dtx v1.0d \invalidchar: (DPC) Comment out (use catcode15 instead)	407	\stepcounter: Use \addtocounter to have name checked	523
General: Remove test for \inputlineno undefined.	403	1994-04-09 ltthm.dtx v1.0b \othm: Use standard counter error message (FMi)	956
1994-03-28 ltfiles.dtx v1.0d \document: (DPC) Use \normalsize not \normalsize	454	1994-04-11 ltclass.dtx v0.3g \endfilecontents: Add star form, don't write \endinput at the end of the file.	1074
(DPC) remove \normalsize check	454	\ProvidesFile: Protect against weird catcodes.	1053
1994-03-28 ltfloat.dtx v1.0b \caption: Use \normalsize not \normalsize	975	1994-04-11 ltfssbas.dtx v2.1h General: Added \defaultscriptratio and \defaultscriptscriptratio ASAJ.	533
General: Split further from ltherest.dtx	972	\defaultscriptratio: Macro added	559
1994-03-28 ltlists.dtx v1.0b General: Improve documentation	860	\defaultscriptscriptratio: Macro added	559
1994-03-28 ltmiscen.dtx v1.0c General: Improve Documentation	819	1994-04-12 ltboxes.dtx v1.0c General: Remove \acci, now defined in lplain.dtx	889
1994-03-28 lplain.dtx v1.0c \newlanguage: Remove some \outer declarations.	17	Remove \dischyp, now defined in ltinit.dtx	889
1994-03-28 ltsect.dtx v1.0b General: Split further from ltherest.dtx	958		
1994-03-28 ltab.dtx v1.0b General: Improve documentation	897		

1994-04-12 ltdefns.dtx v1.0g		1994-04-18 ltfsstrc.dtx v2.3d
\@dischyp: Define \@dischyp, was previously in ltboxes.dtx	110	General: Changed to new error/warning scheme
1994-04-12 lplain.dtx v1.0d		\font@submax: Changed dimen to macro
General: Define \@acci	32	\fontsubfuzz: Changed dimen to macro
1994-04-12 ltvers.dtx v1.0b		\subst@size: \font@submax and \fontsubfuzz now macros
General: Have version info generated automatically.	37	1994-04-19 ltpage.dtx v1.0b
1994-04-14 ltntcmd.dtx v3.2b		General: Improve documentation
General: Macros renamed to non-private forms, JB	747	1994-04-20 ltntcmd.dtx v3.3a
\DeclareOldFontCommand: Renamed from \@newfontswitch	754	General: Documentation up-dated
1994-04-15 ltboxes.dtx v1.0d		New implementation of \nocorr
\@isavebox: Added missing percent character.	884	\check@nocorr@: Macros added
1994-04-17 ltcounds.dtx v1.0e		\maybe@ic@: \nocorr etc removed from list of tokens to check, leaving only punctuation characters
\@newctr: Use \@nocnterr instead of \@nocnterr	523	1994-04-20 ltmiscen.dtx v1.0e
\addtocounter: Use \@nocnterr instead of \@nocnterr	522	\@enddocument@kernel@warnings: Changed logic for producing warning messages
\setcounter: Use \@nocnterr instead of \@nocnterr	522	1994-04-21 ltboxes.dtx v1.0e
1994-04-17 lterror.dtx v1.0h		\@iiiminipage: Extra \bgroup for color
\@nocnterr: New name for error message, old error message (without arg) kept	404	\@mpfootnotetext: Extra \endgraf for color
1994-04-17 ltthm.dtx v1.0c		\@endminipage: Extra \egroup for color
\@othm: Use new std counter error message (FMi)	956	1994-04-21 ltfinal.dtx v0.1c
\@othm: Use new std counter error message (FMi)	956	General: Added comments, set the catcodes of 128–255.
1994-04-18 ltfinal.dtx v0.1b		1994-04-22 ltfsini.dtx v2.1g
General: Initialise \textheight, \textwidth and page style	1263	\not@math@alphabet: Message changed again
1994-04-18 ltfloat.dtx v1.0d		1994-04-23 ltfinal.dtx v0.1d
\@footnotetext: (DPC) Remove Colour support	991	General: Check that \font@submax is still zero
\@savemarbox: (DPC) Remove Colour support	985	1994-04-24 ltoutput.dtx v1.0m
1994-04-18 ltfsbas.dtx v2.1i		\@resethfps: Number 2 changed to \tw@
General: Macro \no@alphabet@help removed again	533	Warning changed
\calculate@math@sizes: Changed message to log only	559	\@specialoutput: Message changed to give more info and ‘top’ removed
\no@alphabet@error: Use std LaTeX error macro	533	\@topnewpage: Message changed to give more info
1994-04-18 ltfsdcl.dtx ???		Warning message removed as it will be generated later
\DeclareMathAlphabet: Pass correct arg (2 not 3)	680	General: Changed \@normalsize to \ normalsize.
1994-04-18 ltfsdcl.dtx v2.1d		Corrected unverbed commands in documentation.
General: Removed surplus \no@alphabet@error (see fam.dtx)	663	Removed some long lines and other aesthetic changes.

Warning messages changed/corrected	1152	1994-04-30 ltfntcmd.dtx v3.3b General: Documentation up-dated and tidied	747
1994-04-24 ltpictur.dtx v0.1b General: Removed surplus spaces after \hbox to in several cases	922	Prefix frag@ changed to frag in \@protecteddef	747
1994-04-25 ltclass.dtx v0.3h General: Removed spurious extra `s at the end of error messages	1042	Title changed	747
1994-04-25 ltfloat.dtx v1.0e \@largefloatcheck: Changed warning message to give more info	981	Warning changed to info message in \@protecteddef	747
Command added	981	1994-04-30 ltoutput.dtx v1.0n \@activechar@info: \@activechar@warning changed to \@activechar@info	1188
General: Changed warning messages	972	\@combinedblfloats: Removed rule in topnewpage case	1195
Removed obsolete tracing code	972	\@emptycol: Empty column action added: \@emptycol	1167
1994-04-27 lfsstrc.dtx v2.3e General: Corrected item that was forgotten in last change.	633	\@fllsetnum: Rogue space removed	1231
1994-04-28 lterror.dtx v1.0j \@inmatherr: Macro added	407	\@specialoutput: Cut-off point changed to 2\baselineskip	1172
1994-04-28 lterror.dtx v1.1c \@inmatherr: Replaced \noexpand with \protect	407	Empty column action added: \@emptycol	1172
1994-04-28 ltfsdcl.dtx v2.1e General: Removed all \uppercase in hex num parsing macros	663	Extra empty column added for twocolumn case	1172
1994-04-28 ltlists.dtx v1.0c \item: Replaced \@ltxnomath by \@inmatherr	872	Extra empty column added for twocolumn case (wrong, see below)	1172
1994-04-28 ltpictur.dtx v0.1c \@multiput: (DPC) Macro added	926	\@topnewpage: Added setting of \col@number	1167, 1168
General: bezier curves added	949	Cut-off point changed to 3\baselineskip	1169
\multiput: (DPC) Ignore spaces between)(.	925	Empty column action added: \@emptycol	1169
\picture: (DPC) Ignore spaces before (.	924	Message changed for Frank	1169
1994-04-28 lplain.dtx v1.0g General: Turn off overfull box tracing in log	25	General: \@activechar@warning changed to an info message.	1152
1994-04-29 ltclass.dtx v1.0a General: Change version number to 1 (no other change)	1042	Added \col@number.	1152
1994-04-29 ltmiscen.dtx v1.0f \@verbatim: \leavevmode added	837	Documentation tidied.	1152
Change to \everypar added	837	Empty column action added.	1152
1994-04-29 ltoutenc.dtx 1.4a General: Removed \EncodingSpecific. Renamed all the commands. Added \DeclareTextGlyph and \UndeclareTextCommand.	479	Fixed bug from \dblfigrule with \@topnewpage.	1152
Removed Rokicki's OT1 variant encoding. Moved the driver to the top.	478	Full of floats action improved.	1152
1994-05-01 lterror.dtx v1.0k \@latexerr: (CAR) Added draft \@latexinfo.	403	\col@number: Added \col@number	1164
1994-05-01 ltoutenc.dtx 1.4a General: Added the \a command.	488	\onecolumn: Added setting of \col@number	1166
Added the \SaveAtCatcode and \RestoreAtCatcode commands.	491	1994-05-01 lterror.dtx v1.0k \@latexerr: (CAR) Added draft \@latexinfo.	403
Removed the uc/lc table settings, since the T1 uc/lc table is now the default.	499	1994-05-01 ltoutenc.dtx 1.4a General: Added the \a command.	488

Rewrote for the new syntax. . .	491, 494	\end@float: (CAR) Added
1994-05-01 ltoutenc.dtx v1.4a		\@largefloatcheck 979
General: Removed Rokicki's encoding.	475	1994-05-03 ltfssdcl.dtx v2.1f
Renamed the commands, removed the \EncodingSpecific command.		General: Renamed
Turned all slots into decimal.		\@C@DeclareMathDelimiter to
Added \a.	475	\@C@DeclareMathDelimiter 663
1994-05-02 ltcntrl.dtx v1.0l		1994-05-03 ltlists.dtx v1.0d
\@break@tfor: Macro added (from ltfiles.dtx)	396	\@item: \hskip changed to \kern 873
1994-05-02 ltdefns.dtx v1.1f		\item: Removed superfluous braces 872
\renewcommand: Removed surplus \space in error	86	1994-05-03 ltmiscen.dtx v1.0h
\renewenvironment: Removed surplus \space in error	87	\@centercr: \@badcrerr replaced by \@nolnerr 833
1994-05-02 ltfiles.dtx v1.0f		1994-05-03 ltab.dtx v1.0d
\@iffilenonpath: \@break@loop renamed to \@break@tfor	468	\@endpbox: Use \@finalstrut based on depth of \@arstrutbox 920
\@obsoletefile: Make \@onlypreamble	472	1994-05-04 ltclass.dtx v1.0b
1994-05-02 ltfinal.dtx v0.1e		\NeedsTeXFormat: Changed wording of the warning 1062
General: Added setting the 'letter' catcodes.	1272	1994-05-04 lterror.dtx v1.0m
Added setting the 'other' catcodes.	1272	\@badcrerr: Error message removed 406
Added setting the special catcodes.	1272	1994-05-05 ltbibl.dtx v1.0c
Made slot 127 illegal	1272	\@citet: Set switch for warning and end of run. 1000
Set all the catcodes	1260	\nocite: Do not write page number in \nocite warning message. 1001
1994-05-02 ltfinal.dtx v0.1f		Set switch for warning and end of run. 1001
General: Set the catcode of control-J.	1272	1994-05-05 ltfinal.dtx v0.1g
1994-05-02 ltmiscen.dtx v1.0g		General: Added empty errhelp. 1260
General: Changed 91 to 1991 and moved some bits	819	\errhelp: Set error help empty. 1277
1994-05-02 ltoutput.dtx v1.0o		1994-05-05 lfntcmd.dtx v3.3c
\@resethfps: Code shortened . . .	1230	\@C@math@egroup: Corrected \@fontswitch and added saved versions 754
General: Code of \@resethfps shortened.	1152	General: Corrected \@fontswitch 747
1994-05-03 ltbibl.dtx v1.0b		1994-05-05 ltmiscen.dtx v1.0i
\nocite: Make \nocite issue a warning for an undefined citation key.	1001	General: Removed braces from ifnextchar and ifstar arguments 819
1994-05-03 ltfinal.dtx v0.1f		1994-05-07 ltab.dtx v1.0c
General: Set the catcode of control-J to be 'other', for use in messages.	1260	\@maxtab: Changed \@firsttab to \chardef 901
1994-05-03 ltfloat.dtx v1.0f		Changed \@maxtab to \@chardef 901
General: (CAR) Added		General: Removed definition of \+ 897
\@largefloatcheck	972	Removed surplus braces from \ifnextchar constructs 897
Removed unnecessary braces from arguments of \@ifnextchar	972	1994-05-08 lfntcmd.dtx v3.3d
\end@dblfloat: \@largefloatcheck added	980	General: Removed \@undefinedfonterror 747
		\normalsize: Removed \@undefinedfonterror 755
		1994-05-09 lfntcmd.dtx v3.3f
		General: Replaced all \next by \let@token and undo change 3.3e, whatever that was. 747

1994-05-10 ltdefns.dtx v1.0n	\@changed@cmd and \DeclareProtectedCommand.	479
General: (ASAJ) Added \DeclareProtectedCommand.	Renamed the commands again.	
Added \DeclareProtectedCommand	Made the encoding part of the	
Removed braces around	command syntax. Added the	
\@ifundefined argument. ASAJ.	\DeclareTextCommand interface.	
\makeatother: Added \makeatletter	Used	
and \makeatother ASAJ.	\DeclareProtectedCommand.	475
1994-05-10 lterror.dtx v1.0n	\DeclareTextAccent: Reimplemented	
\@latexerr: (ASAJ) Added extra	using \DeclareTextCommand.	482
blank lines to \@latexerr.		
1994-05-10 ltmiscen.dtx v1.0j	1994-05-11 ltspace.dtx v1.0o	
\@sverb: Slight change in error	\hspace: Use	
message text.	\DeclareRobustCommand. ASAJ.	448
1994-05-11 ltboxes.dtx v1.0f	1994-05-12 ltboxes.dtx v1.0g	
\@begin@tempboxa: Use new	\@finalstrut: macro added	895
\color@setgroup concept.	\fbox: New definition, merged with	
\@iiminipage: Use new	\fframebox	885
\color@setgroup concept.	\framebox: Merged \fbox and	
\@mpfootnotetext: Use new	\fframebox	886
\color@setgroup concept.	\normalcolor: macro added for color	
Use new \normalcolor and	support	882
\@finalstrut.		
General: Superfluous braces removed	1994-05-12 ltdefns.dtx v1.0p	
from several commands	General: (ASAJ) Fixed a bug with	
\color@setgroup: macro added for	\relax which was using \gobble	
color support	before defining it.	80
\endminipage: Use new	Fixed a bug with \relax which	
\color@setgroup concept.	was using \gobble before defining	
1994-05-11 ltclass.dtx v1.0c	it.	90
\endfilecontents: Add checks for	1994-05-12 ltfssbas.dtx v2.1j	
form feed and tab	General: New baselinestretch concept	533
1994-05-11 ltdirchk.dtx v1.0e	Replaced hand-protected commands	
General: Add \ProvidesFile as used	by \DeclareRobustCommand defs	533
in fd files.	\f@linespread: New macro	545
1994-05-11 lterror.dtx v1.0o	\fontencoding: Use	
\@latexerr: (ASAJ) Removed one of	\DeclareRobustCommand.	543
the extra blank lines to	\fontfamily: Use	
\@latexerr.	\DeclareRobustCommand.	544

1994-05-11 ltoutenc.dtx 1.5a	\mathversion: Use	
General: Made T1 and OT1 generate	\DeclareRobustCommand.	546
packages rather than def files.	1994-05-12 ltfssdcl.dtx v2.1g	
Renamed the ‘package’ module to	General: Allow \relax as undefined	
‘teststy’.	command	663
1994-05-11 ltoutenc.dtx v1.5a	Allow \relax’ed cmds to be	
General: Reimplemented	declared	663
\DeclareTextCommand using	1994-05-12 ltfssini.dtx v2.1i	
	General: Moved \fontencoding to	
	fam.dtx	695

Moved \fontfamily to fam.dtx	695	1994-05-13 ltfiles.dtx v1.0g
Moved \fontseries to fam.dtx	695	\document: Added execution of \every@size
Moved \fontshape to fam.dtx	695	454
Moved \fontsize to fam.dtx	695	1994-05-13 ltfinal.dtx v0.1h
Moved \mathversion to fam.dtx	695	General: Added package ot1enc, and defined \@acci, \@accii and \@acciii.
Moved \selectfont to tracefnt.dtx	695	1260
1994-05-12 lfsstrc.dtx v2.3f		
\selectfont: Use \DeclareRobustCommand	637	1994-05-13 ltfinal.dtx v1.0h
1994-05-12 ltoutenc.dtx 1.5a		General: Added output enc stuff
General: Removed the \SaveAtCatcode and \RestoreAtCatcode commands.	491	1276
Rewrote for the new syntax.	491, 494	1994-05-13 ltfloat.dtx v1.0g
1994-05-12 ltoutput.dtx v1.0p		\@footnotetext: (DPC) Add new style colour support: \normalcolor
\@writesetup: \normalcoloradded	1188	991
General: \normalcoloradded in various places (DPC).	1152	(DPC) Use \@finalstrut
1994-05-13 ltboxes.dtx v1.0h		\@xfloat: (DPC) Use \normalcolor
\@arrayparboxrestore: New accent system, use \let not \def	890	977
1994-05-13 ltcnts.dtx v1.0f		1994-05-13 ltftcmd.dtx v3.3g
General: Removed \@Ialph	528	General: Replaced \@protecteddef by \DeclareRobustCommand
Removed \@i alph	528	747
1994-05-13 ltdefns.dtx v1.0q		1994-05-13 ltfsbas.dtx v2.1k
General: (ASAJ) Renamed \DeclareProtectedCommand to \DeclareRobustCommand.		General: Remove File identification ‘typeout’
Removed \@if@short@command.	80	533
(ASAJ) Replaces \space by ‘ ’ in \csname.	80	1994-05-13 ltfsbas.dtx v2.1l
Renamed \DeclareProtectedCommand to \DeclareRobustCommand.		\DeclareFontEncoding: Init encoding change command
Removed \@if@short@command.		537
Moved to after the definition of \@gobble.	90	\define@newfont: Use \@input@ for fd files
1994-05-13 ltdefns.dtx v1.0r		1994-05-13 ltfsdcl.dtx v2.1h
General: (ASAJ) Added logging message to \DeclareProtectedCommand.	80	General: Removed file identification typeout
Added logging message to \DeclareProtectedCommand.	90	663
1994-05-13 ltdefns.dtx v1.0s		1994-05-13 ltfsini.dtx v2.1j
General: (ASAJ) Added \@backslashchar.	80	General: Removed file identification typeout
(ASAJ) Coded \ifdefinable more efficiently.	80	695
Coded more efficiently, thanks to FMI.	86	1994-05-13 lfsstrc.dtx v2.3g
1994-05-13 ltfiles.dtx LaTeXe		General: Removed typeouts as \ProvidesPackage writes to log.
\listfiles: Stop \listfiles being run twice	472	633

1994-05-14 ltfssbas.dtx v2.1n	1994-05-16 ltfssbas.dtx v2.1p
General: Set defaults for all <code>\f@...</code>	545
<code>\DeclareErrorFont</code> : Don't set <code>\f@encoding</code>	553
<code>\DeclareFontEncoding</code> : Log if encoding is redeclared	537
Only init enc change cmd when new encoding	537
1994-05-14 ltfssini.dtx v2.1k	1994-05-16 ltlogos.dtx v1.1a
General: Init error font just before checking for fontdef.cfg	720
<code>\reset@font</code> : Remove surplus braces	718
1994-05-14 ltfssrc.dtx v2.3h	1994-05-16 ltmath.dtx v1.0k
<code>\selectfont</code> : Added <code>\enc@update</code>	639
1994-05-14 ltoutenc.dtx 1.5d	1994-05-16 ltoutenc.dtx 1.5h
General: Moved the driver to the top.	478
1994-05-14 ltoutenc.dtx v1.5c	1994-05-16 ltoutenc.dtx v1.5f
General: Added the fontenc package	518
Added the fontenc package.	475
Fixed a bug which caused an infinite loop if <code>\f@encoding</code> was incorrectly set.	475, 479
Moved fontsmp to its own dtx file.	475
1994-05-14 ltoutenc.dtx v1.5d	1994-05-16 ltoutenc.dtx v1.5g
General: Rewrote <code>\DeclareTextCommand</code> to define its argument to use the current encoding by default, rather than the encoding provided to <code>\DeclareTextCommand</code>	479
Tidied up the documentation.	475
1994-05-14 ltoutenc.dtx v1.5e	1994-05-16 ltoutenc.dtx v1.5h
General: Replaced <code>\ENC@cmd</code> by <code>\ENC-cmd</code>	475
1994-05-15 ltfssbas.dtx v2.1o	1994-05-16 ltoutenc.dtx v1.5i
General: encoding cmd changed to <code>enc-cmd</code>	533
1994-05-16 fontdef.dtx v2.1g	1994-05-16 ltoutput.dtx v1.0q
General: Removed <code>\DeclareFontEncoding</code> for ot1 and t1 and input .def files instead	725
1994-05-16 ltalloc.dtx v1.1a	<code>\@writesetup</code> : Changed setting of accents (FMi): with the new encoding setup they can use <code>\let</code> . It could also use the new internal commands?
General: (ASAJ) Split from ltinit.dtx.	391
1994-05-16 ltcntrl.dtx v1.0a	General: Changed setting of accents (FMi).
General: (ASAJ) Split from ltinit.dtx.	393
1994-05-16 ltdefns.dtx v1.1a	1994-05-16 ltpar.dtx v1.1a
General: (ASAJ) Split from ltinit.dtx.	80
1994-05-16 lterror.dtx v1.1a	General: (ASAJ) Split from ltinit.dtx.
General: (ASAJ) Completely new error interface.	397
(ASAJ) Split from ltinit.dtx.	397
1994-05-16 ltfinal.dtx v1.0i	1994-05-16 lplain.dtx v1.0h
General: moved output enc stuff to lffonts	1276
	General: Comment out encoding specific commands
	Remove <code>\@acci</code> and friends again
	Remove unnecessary def for <code>\item</code>
	<code>\loop</code> : Use Kabelschacht method
	<code>\m@th</code> : Remove unnecessary space

1994-05-16	ltspace.dtx v1.1a		
General:	(ASAJ) Split from ltinit.dtx.	430	
1994-05-17	ltclass.dtx v1.0e		
\use@option:	Execute option after removing from list, not before	1058	
1994-05-17	ltdefns.dtx 1.1b		
General:	(ASAJ) Added the \protect@... commands.	90	
1994-05-17	ltdefns.dtx v1.1b		
General:	(ASAJ) Added definitions for protect.	80	
(ASAJ)	Removed warnings and logging to lterror.dtx.	80	
Added the discussion of protected commands, defined the values that \protect should have.	90		
1994-05-17	ltdefns.dtx v1.1c		
General:	(ASAJ) Redid definitions for protect.	80	
1994-05-17	lterror.dtx v1.1b		
General:	(ASAJ) Moved error stuff from ltdefns.dtx.	397	
1994-05-17	ltssini.dtx v2.1n		
\copyright:	Really add extra braces	718	
\nfss@text:	Added braces to allow use in subscripts	718	
1994-05-17	ltmath.dtx v1.0i		
General:	Replaced \let by \gdef, for indirect definition.	851	
1994-05-17	ltoutenc.dtx v1.5j		
General:	Added braces to \pounds so it works as a subscript.	475	
1994-05-18	ltdefns.dtx 1.1c		
General:	(ASAJ) Renamed the commands, and removed one which is no longer needed.	90	
1994-05-18	ltdefns.dtx v1.1c		
General:	Redid the discussion and definitions, in line with the proposed new setting of \protect in the output routine.	90	
1994-05-18	ltfinal.dtx v0.1j		
General:	Corrected the lccode for d-bar.	1260	
1994-05-18	ltlogos.dtx v1.1b		
General:	(ASAJ) Added the T _E X logo.	450	
(ASAJ)	Made the L ^A T _E X 2 _ε logo use the text font '2' rather than the math font '2'.	450	
1994-05-18	ltoutenc.dtx v1.5k		
General:	Made dotted-i produce 'i'. Removed braces from \pounds and \\$.	475	
		Replaced \defaultencoding with \encodingdefault.	475
1994-05-19	ltbibl.dtx v1.1a		
General:	Initial version of ltbibl.dtx, split from ltidxbib.dtx	998	
1994-05-19	ltcounts.dtx v1.1a		
General:	Extracted file from ltcntlen.	521	
1994-05-19	ltdefns.dtx v1.1d		
General:	(RmS) Added definitions for \@namedef and \@nameuse again.	80	
1994-05-19	ltfinal.dtx v0.1k		
General:	Removed \makeat...	1260	
1994-05-19	ltidxglo.dtx v1.1a		
General:	Initial version of ltidxglo.dtx, split from ltidxbib.dtx	995	
1994-05-19	ltlength.dtx v1.1a		
General:	Extract file ltlength from ltcntlen.	531	
1994-05-19	ltpageno.dtx v1.1a		
General:	Extract file ltpageno from ltcntlen.	796	
1994-05-19	ltplain.dtx v0.1k ltfinal		
\showoutput:	used \maxdimen not 99999	33	
\showoverfull:	used \@ne not 1	33	
1994-05-19	lxref.dtx v1.1a		
General:	Extract file lxref from ltcntlen.	797	
1994-05-20	ltdefns.dtx v1.1e		
General:	Changed command name from \@checkcommand to \CheckCommand.	80	
\CheckCommand:	Changed name from \@checkcommand to \CheckCommand.	88	
1994-05-20	ltfinal.dtx v1.1c		
General:	(ASAJ) Added \@latex@info@no@line.	397	
(ASAJ)	Added missing full stops.	397	
(ASAJ)	Fixed a bug with \@inmatherr.	397	
1994-05-20	ltfinal.dtx v0.11		
General:	Use new font warning commands	1267	
1994-05-20	ltfloat.dtx v1.0h		
\@endfloatbox:	Restore outer value of @nobreak switch.	981	
\outer@nobreak:	Macro added: default is to do nothing.	981	
1994-05-20	ltfntcmd.dtx v3.3h		
General:	Use new error commands	747	
1994-05-20	ltfssbas.dtx v2.1q		
General:	Use new error commands	533	

1994-05-20 lfsstrc.dtx v2.3i		1994-05-22 lterror.dtx v1.2a	
General: Use new error command names 633		General: (ASAJ) Made \GenericError, \GenericWarning and \GenericInfo robust. 397	
1994-05-20 ltmiscen.dtx v1.0l		(ASAJ) Replaced \\ and tilde by \MessageBreak and \space. 397	
\@writefile: Added correct setting of \protect. 826		(ASAJ) Replaced \@generic@message and \@generic@error by \GenericError, \GenericWarning and \GenericInfo. 397	
1994-05-20 ltmiscen.dtx v1.0m		(ASAJ) Replaces \string by \protect in some messages. 397	
General: Use new warning commands 819		1994-05-22 lterror.dtx v1.2d	
1994-05-20 ltoutput.dtx v1.0s		\GenericError: (DPC) Alternative version added for old TeXs 398	
\@writesetup: Added setting of \protect during \shipout. 1188		(DPC) New version using long command name. 398	
General: Added setting of \protect during \shipout. 1152		1994-05-22 lffloat.dtx v1.0i	
1994-05-20 ltpage.dtx v1.0d		General: Use new warning commands 972	
\markright: Changed setting for \protect. 1034		1994-05-22 ltoutput.dtx v1.0t	
1994-05-20 ltsect.dtx v1.0c		General: Changed warnings and infos to new commands. 1152	
\addcontentsline: Correct setting of \protect. 967		1994-05-22 ltpictur.dtx v0.1e	
\addtocontents: Correct setting of \protect. 968		General: Use new warning cmd ... 922	
1994-05-21 ltbibl.dtx v1.1b		1994-05-23 ltclass.dtx v1.0h	
General: Use new warning commands 998		\NeedsTeXFormat: Don't stop completely when format is wrong 1062	
1994-05-21 lterror.dtx v1.1d		\usepackage: Remove argument if possible 1061	
General: (ASAJ) Made the error commands robust. 397		1994-05-23 ltdirchk.dtx v1.0f	
1994-05-21 lffiles.dtx v1.0h		General: Document \CTeXversion ... 1	
General: Use new error commands . 451		1994-05-23 lfsstrc.dtx v2.3j	
1994-05-21 ltlists.dtx v1.0f		General: Removed def of \f@warn@break 652	
General: Use new error commands . 860		1994-05-23 ltoutput.dtx v1.0u	
1994-05-21 ltmiscen.dtx v1.0n		\@activechar@info: Added \MessageBreak 1188	
General: Use new error commands . 819		\@writesetup: Changed resetting of \protect after shipout to use \aftergroup 1188	
1994-05-21 ltsect.dtx v1.0d		General: Added \MessageBreak. ... 1152	
General: Use new error commands . 958		Changed resetting of \protect after shipout. 1152	
1994-05-21 ltab.dtx v1.0f		1994-05-24 lterror.dtx v1.2e	
General: Use new error commands . 897		\@latex@info@no@line: Macro added 401	
1994-05-21 ltxref.dtx v1.1b		1994-05-24 lterror.dtx v1.2f	
General: Use new warning commands 797		General: (DPC) wrap long lines ... 397	
\newlabel: Use new warning commands 800		1994-05-24 lfntcmd.dtx v3.3i	
1994-05-22 ltclass.dtx v1.0f		General: Tidying and typos fixed ... 747	
General: Use new warning and error commands 1038		1994-05-24 ltmiscen.dtx v1.0q	
1994-05-22 ltdefns.dtx v1.1f		\@currenvline: Use \empty as outer default 832	
General: Use new warning and error cmds 80			
1994-05-22 lterror.dtx v1.1e			
General: (ASAJ) Replaced bgroup by begingroup in error messages, to stop extra mathords creeping into math mode. 397			

1994-05-25 ltdirchk.dtx v1.0g	\filename@parse: Mac parser had "typo for : 12	\framebox: New version, so \width is correct in \framebox 886
1994-05-25 ltfnctcmd.dtx v3.3j	General: Insertion of \aftergroups to implement \nocorr moved to the end of the group 747	\LaTeX: Add \m@th to force math size calculations 450
	\check@icr: Macros added 751	1994-06-01 ltoutput.dtx v1.0w
	\check@nocorr@: Insertion of \aftergroups moved and defaults set up for efficiency 751	General: Tidied up typesetting. ... 1152
	\DeclareTextFontCommand: \expandafter inserted 749	1994-06-08 ltfinal.dtx v1.0m
	Insertion of \aftergroups moved 749	General: Add patch file system ... 1276
1994-05-25 ltoutput.dtx v1.0v	General: Extra documentation. ... 1152	1994-06-09 ltfinal.dtx v1.0n
1994-05-25 ltsect.dtx v1.0e	\dottedtocline: Put braces around argument 4 (the actual toc entry) to avoid font (and possibly other) changes leaking out to the leaders. 970	General: For TeX2, do not set codes for higher half of character table. 1265, 1273
1994-05-25 ltthm.dtx v1.0c	General: Modify documentation ... 954	1994-06-09 ltfnctcmd.dtx v3.3k
1994-05-25 ltvers.dtx v1.0d	General: Remove PRELIMINARY TEST RELEASE from startup banner (spring is here) 37	General: Tidying and typos fixed in documentation 747
1994-05-25 ltxref.dtx v1.1c	General: Modify documentation ... 797	1994-06-18 ltfnctcmd.dtx v3.3l
1994-05-26 ltfiles.dtx LaTeX2e	\missingfileerror: Modify message format 470	General: Added check for empty text 747
1994-05-26 ltlogos.dtx v1.1c	General: Remove \SLiTeX logo ... 450	\check@nocorr@: Added check for empty text 751
1994-05-26 ltmiscen.dtx v1.0r	General: \literal removed 843	1994-06-22 ltsect.dtx v3.3m
1994-05-26 ltplain.dtx v1.1m	\iterate: (CAR) added \long 29	General: Removed space from \nfss@text 747
	\underbar: (CAR/FMi) changed to use box \tw@ 31	Renamed \check@nocorr 747
1994-05-26 ltplain.dtx v1.1p	\underbar: (DPC) changed to use \sbox 31	\check@nocorr@: Renamed \check@nocorr to \text@command to improve \long error message . 751
1994-05-29 ltfsdcl.dtx v2.1j	General: Use new error commands .. 663	\DeclareTextFontCommand: Removed space from \nfss@text 749
1994-05-31 ltfinal.dtx v1.0n	General: Renamed lthyphen.* to lthyphen.*. 1260	1994-06-22 ltmath.dtx v1.2t classes
	\@framebox: Macro added. 887	\mathindent: Set \mathindent at the end of the class instead of at begin document 857
	\@ifframebox: New version, so \width is correct in \framebox 886	1994-07-20 ltlogos.dtx v1.1e
	\fbox: New version, using \@framebox 885	\LaTeX: Save a few tokens 450
		\LaTeXe: Save a few tokens 450
		1994-07-20 ltpage.dtx v1.0h
		\sloppy: Save a few tokens 1037
		1994-09-16 ltfsbas.dtx v2.1s
		\nfss@catcodes: Reset [and] as well, just in case 551
		1994-10-07 ltoutenc.dtx v1.5l
		General: Moved the ogonek accent. . 475
		1994-10-11 ltdirchk.dtx v1.0h
		\@TeXversion: Check for TeX3.14 ... 13
		General: Modify all of ltxcheck again 13
		1994-10-12 ltsect.dtx v1.0f
		General: Doc. typos 958
		1994-10-14 fontdef.dtx v2.2a
		General: New coding 723
		1994-10-14 ltfsini.dtx v2.2a
		General: New coding for cfg files ... 695
		1994-10-14 ltmiscen.dtx v1.0s
		General: Move math to other file ... 819

1994-10-14 ltplain.dtx v1.1a		1994-10-25 fontdef.dtx v2.2c	
General: Moved code to other files. . .	14	General: Added OMSenc.def	725
1994-10-15 ltfssbas.dtx v2.1t		1994-10-25 ltboxes.dtx v1.0l	
<code>\extract@alph@from@version:</code> Warn		<code>\@isavepicbox:</code> missing percent	
if math alpha is used outside		(moved from ltpatch)	884
math	559	1994-10-25 ltdefsns.dtx v1.2b	
1994-10-18 ltboxes.dtx v1.0j		General: Documentation	
<code>\@frameb@x: \leavevmode</code> added . . .	887	improvements	80
<code>\@iframebox: \leavevmode</code> moved to		1994-10-25 ltoutenc.dtx 1.6a	
<code>\@frameb@x</code>	886	General: Added <code>\textdollar,</code>	
<code>\@parboxto:</code> Macro added to remove		<code>\textbraceleft, \textbraceright,</code>	
misuse of <code>\empty</code>	888	<code>\textsterling, \textunderline.</code>	494
General: stuff from ltpatch done . . .	879	Removed <code>\textbraceleft,</code>	
<code>\fbox: \long</code> added	885	<code>\textbraceright, \textunderline</code> to	
<code>\mbox: \long</code> added	880	give them their proper names. . .	494
<code>\sbox: \long</code> added	884	1994-10-25 ltoutenc.dtx v1.6a	
1994-10-18 ltclass.dtx v1.0j		General: Added	
General: Move <code>\listfiles</code> to		<code>\ProvideTextCommand,</code>	
<code>ltfiles.dtx</code>	1038	<code>\UseTextSymbol, \UseTextAccent,</code>	
1994-10-18 ltdefns.dtx v1.2a		<code>\DeclareTextSymbolDefault,</code>	
<code>\@star@or@long:</code> macro added . . .	83	<code>\DeclareTextAccentDefault,</code>	
General: Add extra test for <code>\endgraf</code>	80	<code>\DeclareTextCommandDefault,</code>	
Add star-forms for all commands .	80	and	
<code>\renew@environment:</code> reset end		<code>\ProvideTextCommandDefault.</code>	475
command	87	Added the <code>\Provide</code> commands,	
1994-10-18 ltfiles.dtx v1.0i		and the default definitions.	479
<code>\listfiles:</code> code moved here from		Added the defaults.	488
<code>ltclass</code>	472	Added the files OT1enc.def,	
1994-10-18 ltoutenc.dtx v1.5l		T1enc.def and OMSenc.def.	488
General: Added new definitions of		Added the OMS encoding.	499
<code>\patterns</code> and <code>\hyphenation</code> . . .	487	1994-10-27 ltoutenc.dtx 1.6b	
1994-10-18 ltoutenc.dtx v1.5m		General: Added <code>\textasciicircum</code>	
General: Added new definitions of		<code>\textasciitilde \textbackslash</code>	
<code>\patterns</code> and <code>\hyphenation</code> . . .	475	<code>\textbar \textbraceleft</code>	
1994-10-18 ltsect.dtx v1.0g		<code>\textbraceright</code>	
<code>\@dottedtocline:</code> Added		<code>\textcompwordmark \textemdash</code>	
<code>\normalcolor</code> for page number .	970	<code>\textendash \textexclamdown</code>	
General: Added <code>\normalcolor</code>	958	<code>\textgreater \texthypenchar</code>	
1994-10-19 ltfssbas.dtx v2.1t		<code>\texthypen \textless</code>	
<code>\DeclareFontEncoding:</code> Add missing		<code>\textquestiondown</code>	
<code>\relax.</code>	537	<code>\textquotedblleft</code>	
1994-10-23 lfsstrc.dtx v23.k		<code>\textquotedblright</code>	
<code>\every@math@size:</code> Renamed to		<code>\textquotedbl \textquotel</code>	
<code>\every@math@size</code>	642	<code>\textquoteright</code>	
1994-10-23 ltmath.dtx v1.0l		<code>\textunderscore</code>	
<code>\eqnnum:</code> Added <code>\normalcolor</code> since		<code>\textvisible</code>	494
<code>\eqno</code> introduces a subgroup of the		Added: <code>\textemdash \textendash</code>	
displayed math group	853	<code>\textexclamdown</code>	
<code>\ensuremath:</code> Remove extra braces:		<code>\texthypenchar \texthypen</code>	
but see p 168 of Leslie's book . . .	856	<code>\textquestiondown</code>	
1994-10-24 ltboxes.dtx v1.0k		<code>\textquotedblleft</code>	
<code>\fbox:</code> Inner braces added (to fix		<code>\textquotedblright</code>	
latex/1061)	885	<code>\textquoteright</code>	491

1994-10-27 ltoutenc.dtx v1.5d	Made <code>\textless</code> and <code>\textgreater</code> come from OML.	489
General: Rewrote		
<code>\DeclareTextSymbol</code> to define its argument to use the current encoding by default, to fit with <code>\DeclareTextCommand</code>	479	
1994-10-27 ltoutenc.dtx v1.6b	Moved math commands here from <code>ltmath</code>	491
General: Added <code>\textbackslash</code>	499	
Added more defaults for OT1.	488	
Removed the enc.def files	475	
Removed the files OT1enc.def, T1enc.def and OMSenc.def.	488	
Renamed <code>\textlbrace</code> to <code>\textbraceleft</code> and <code>\textrbrace</code> to <code>\textbraceright</code>	499	
1994-10-29 ltmath.dtx 1.0m	Removed <code>\@dblfloat</code> : Major changes since two-column and one-column cases merged	975
General: ASAJ: Added		
<code>\DeclareMathOperator</code>	844	
ASAJ: Tidied up documentation.	852	
1994-10-29 ltmath.dtx v1.0m	<code>\@dblflset</code> : Macro added	975
General: ASAJ: Added	Major changes to parameter parsing, setting of local variables, etc; two-column and one-column cases merged; space hacks moved	975
<code>\mathellipsis</code> , <code>\mathdollar</code> and <code>\mathsterling</code>	851	
ASAJ: Removed <code>\dag</code> , <code>\ddag</code>	851	
ASAJ: Renamed <code>\S</code> and <code>\P</code> to <code>\mathsection</code> and <code>\mathparagraph</code> and made them <code>\mathchardef</code> s.	851	
1994-10-29 ltoutenc.dtx v1.6c	<code>\@endfloatbox</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	981
General: Added commands like <code>\dots</code> for use in text and math.	488	
Renamed <code>\P</code> , <code>\S</code> , <code>\dag</code> and <code>\ddag</code> to <code>\textparagraph</code> , <code>\textsection</code> , <code>\textdagger</code> and <code>\textdaggerdbl</code>	475	
1994-10-30 ltdefns.dtx v1.2c	<code>\@floatboxreset</code> : Macro added	979
<code>\@onelvel@sanitize</code> : Macro added	109	
General: (CAR) <code>\@onelvel@sanitize</code> added	80	
1994-10-30 ltdefns.dtx v1.2f	<code>\@footnotetext</code> : (DPC/CAR) Move colour setting to output routine	991
General: (DPC) <code>\newwrite</code> 's moved to <code>ltfiles</code>	80	
1994-10-30 ltmath.dtx v1.0n	<code>\@savemarbox</code> : (DPC/CAR) Extra box added for colour	985
General: ASAJ: Moved the new commands to ltoutenc.	851	
1994-10-30 ltoutenc.dtx v1.6d	<code>\@setfps</code> : Macro added	976
General: Added	<code>\@dblfloat</code> : Macros removed: <code>\@dbflt</code> , <code>\@dblfloat</code>	981
<code>\DeclareTextCompositeCommand</code>	475	
Added <code>\textcircled</code>	475, 489, 499	
Added <code>\t</code>	489	
Added math commands.	475	
Added OML encoding.	475, 489	
Added the OML encoding.	500	
1994-10-31 fontdef.dtx v2.2d	<code>\@endfloatbox</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	977
General: Added OMLenc.def	725	
1994-10-31 fontdef.dtx v2.2e	Major changes, removing setting of local variables, space hacks etc; two-column and one-column cases merged	976
General: ... and moved further down	725	
1994-10-31 ltfloat.dtx v1.1a	Reset hook added	977
<code>\@dblfloat</code> : Major changes since two-column and one-column cases merged	975	
<code>\@dblflset</code> : Macro added	975	
<code>\@endfloatbox</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	981	
<code>\@floatboxreset</code> : Macro added	979	
<code>\@footnotetext</code> : (DPC/CAR) Move colour setting to output routine	991	
<code>\@savemarbox</code> : (DPC/CAR) Extra box added for colour	985	
<code>\@setfps</code> : Macro added	976	
<code>\@dblfloat</code> : Macros removed: <code>\@dbflt</code> , <code>\@dblfloat</code>	981	
<code>\@xfloat</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	977	
Major changes, removing setting of local variables, space hacks etc; two-column and one-column cases merged	976	
Reset hook added	977	
<code>\@xmpar</code> : (DPC/CAR) Extra box added since needed for floats	986	
<code>\fps@dbl</code> : Macro added	976	
1994-10-31 ltoutput.dtx v1.1a	<code>\@topnewpage</code> : (DPC/CAR) Extra box added to remove colour resetting from vmode	1168
(DPC/CAR) Use <code>\color@begingroup</code> for colour	1168	
(DPC/CAR) Use <code>\normalcolor</code>	1168	
1994-11-02 ltoutenc.dtx v1.6d	General: Wrapped lines longer than 70 characters.	475

1994-11-03 ltclass.dtx v1.0k		1994-11-04 ltpage.dtx v1.0e
General: Move \@missingfileerror to ltfiles	1042	\markright: Added \unexpandable@protect. ASAJ.
1994-11-03 ltdirchk.dtx v1.0i		1034
General: Generate an error if latex.ltx not used with clean initex	1	1994-11-04 ltsect.dtx 1.0h
1994-11-03 ltfiles.dtx v1.0j		\@sect: (ASAJ) Added \protected@edef.
\@missingfileerror: Move here from ltclass	470	General: (ASAJ) Added \protected@xdef to \thanks.
1994-11-04 ltboxes.dtx v1.0m		958

	General: Updated some plain macros	492		\protected@write: (CAR) added \long	458
1995-05-21	ltplain.dtx v1.1j				
	General: Moved some code to other files	14			
1995-05-22	ltplain.dtx v1.1k				
	General: Definitions of \footins and \footnoterule moved to ltfloat.	33			
1995-05-22	lttab.dtx v1.1a				
	General: Support autoloading feature	897			
1995-05-23	ltfssini.dtx v2.2e				
	\newfont: Font assignment made local again.	717			

1995-05-25	ltfloat.dtx v1.1m		1995-06-06	ltfinal.dtx v1.0s
	\@savemarbox: (CAR) Resettings moved to hook	985		General: Made \MakeUppercase and \MakeLowercase brace their argument.
	\@xfloat: (CAR) Resettings moved to hook	977		1260
1995-05-25	ltlists.dtx v1.0i		1995-06-09	ltoutenc.dtx v1.7l
	\endtrivlist: Macros moved from ltspace.dtx	869		\DeclareTextComposite: Rewrote \DeclareTextComposite to define the composite as a no-argument command rather than a two-argument command.
1995-05-25	ltmath.dtx v1.3c classes			483
	\@eqnnum: replace \reset@font\rmfamily with \normalfont (PR 1578)	857	1995-06-11	ltspace.dtx v1.2g
1995-05-25	ltspace.dtx v1.2f			\restorecr: (CAR) \relax added to stop silent eating of *.
	\@vbsphack: (CAR) not used so 'removed'.	440	1995-06-13	ltfinal.dtx v1.0t
	\@vspacer: (CAR) \@restorepar added to avoid possible infinite tail recursion caused by a typo in the argument.	444		General: Add patch level string more carefully
	(CAR) macros modified to be more efficient	444		Call \errorstopmode
	General: Macros moved to ltlists.dtx	430	1995-06-13	lpictur.dtx v1.1b
1995-05-26	ltdefns.dtx v1.2n			General: Use \ProvidesFile in autoload
	\@gobblefour: (CAR) Added \longs	89	1995-06-14	lttab.dtx v1.1b
1995-05-26	ltmath.dtx v1.0s			General: Use \ProvidesFile in autoload
	\@eqnnum: Removed \rmfamily (PR 1578), replaced \reset@font with \normalfont	853	1995-06-15	ltfssbas.dtx v3.0c
1995-05-26	ltpage.dtx v1.0g			General: (DPC) minor documentation changes
	\ps@plain: removed \rmfamily (PR 1578)	1034	1995-06-15	ltfsscmp.dtx v3.0b
1995-05-27	ltfssbas.dtx v3.0b			General: (DPC) minor documentation edits
	\mathgroup: (FMi) But a need to define \new@mathgroup	533	1995-06-15	ltfssdel.dtx v3.0b
1995-06-05	fontdef.dtx v2.2k			General: (DPC) minor documentation changes
	General: Moved math commands from ltoutenc.dtx.	741	1995-06-19	ltbibl.dtx v1.1h
1995-06-05	ltfinal.dtx v1.0r			\bincite: Call \@newl@bel so repeated keys produce better warning.
	General: Added \MakeUppercase and \MakeLowercase.	1260	1995-06-19	ltclass.dtx v1.0q
1995-06-05	ltoutenc.dtx v1.7k			\documentclass: Don't redefine \usepackage in compat mode for /1634
	\@inmathwarn: Removed \protected@cmd and replaced with explicit \noexpand.	480	1995-06-19	ltxref.dtx v1.1e
	General: Allowed \ProvideTextCommandDefault after the preamble.	481		\newlabel: Use \@newl@bel to share code with \bincite
	Commented out \textless and \textgreater.	489		800
	Moved math commands to fontdef.dtx.	491	1995-06-28	ltfssini.dtx v3.0b
	Save some tokens in \textvisiblespace and \textunderscore.	489		General: (DPC) Fix documentation typos
			1995-06-28	ltmath.dtx v1.0t
				General: minor doc edits
1995-07-02	ltplain.dtx v1.1n			844
	General: Removed surplus 'by' and '=' in various places	14		\offinterlineskip: Replaced 1000 by \@m
				30

\showoutput: Use \showoverfull to save space	33	General: Improve Documentation	819
\tracingall: Use \showoutput to save space	33	\enddocument: Set \@setckpt to \gobbletwo instead of defining it by hand	820
1995-07-03 ltdefns.dtx v1.2o		Shorten redefinition of \bibcite and \newlabel	821
\set@typeset@protect: Use \@typeset@protect for init	92	1995-07-14 ltbibl.dtx v1.1i	
1995-07-03 lftntcmd.dtx v3.3s		\bibcite: Remove \onlypreamble so still defined in new \enddocument	999
\t@st@ic: Use clean interface for jump	753	1995-07-14 ltxref.dtx v1.1g	
1995-07-05 lftntcmd.dtx v3.3s		\newlabel: Remove \onlypreamble so still defined in new \enddocument	800
\t@st@ic: Renamed from \test@next	753	1995-07-19 ltfssini.dtx v3.0d	
1995-07-05 ltspace.dtx v1.2h		General: (DPC) TeX2 support	721
\@newline: Use \break	436	1995-07-20 ltboxes.dtx v1.0v	
\@no@pgbk: Macro replaces \pgbk and \@nopgbk	434	\@isavebox: Use \sbox	884
\nopagebreak: Reimplemented both using \@no@pgbk	433	\@isavepicbox: Use \sbox	884
1995-07-09 ltcntrl.dtx v1.0f		1995-07-21 ltoutput.dtx v1.1o	
\@iforloop: Reimplemented using Kabelschacht method	396	\@writesetup: Command added	1188
\@iwhiledim: Reimplemented using Kabelschacht method	394	New, experimental, versions: need in-lining	1188
\@iwhilenum: Reimplemented using Kabelschacht method	394	1995-08-09 ltmath.dtx v1.0u	
\@iwhilesw: Reimplemented using Kabelschacht method	394	General: Added code for class options leqno and fleqn	857
\@tfor: Reimplemented using Kabelschacht method	396	1995-08-11 ltlength.dtx v1.1b	
1995-07-09 ltlists.dtx v1.0j		General: Doc typos fixed for latex/753	531

General: Documentation of problems added 430		Remove unnecessary \global before \@nobreak... 874	
1996-07-10 ltfinal.dtx v1.0y		1996-07-26 ltmath.dtx v1.1b	
\toks: Free up memory from scratch registers /2213 1277		General: Removed \global before \@ignoretrue in various places. . 844	
1996-07-19 ltoutenc.dtx v1.8a		1996-07-26 ltmiscen.dtx v1.1e	
\@strip@args: Use char 0 not @ as carrier for \lowercase /2197 ... 485		\@ignorefalse: put \global into definition 820	
1996-07-26 ltboxes.dtx v1.0z		\begin: remove \global before \@ignore... 828	
\if@minipage: put \global into definition 890		\end: remove \global before \@ignore... 830	
1996-07-26 ltclass.dtx v1.0u		\ignorespacesafterend: user level macro added 820	
\@classoptionslist: made only preamble 1043		1996-07-26 ltoutput.dtx v1.1v	
\@unusedoptionlist: made only preamble 1043		\@testfp: remove \global before \@test... 1230	
1996-07-26 ltdefns.dtx v1.2y		\@xtryfc: remove \global before \@test... 1198	
\@reargdef: third arg picked up by \@yargdef 85		\@ztryfc: remove \global before \@test... 1199	
\@renew@command: use \noexpand instead of \string 86		General: put \global into definition 1162 remove \global before \@test... 1162	
use \relax in place of empty arg . 86		\@clearpage: add number of missing percents 1165	
\@renew@environment: use \relax in place of empty arg 87		1996-07-26 lplain.dtx v1.1t	
		\sh@ft: replace \dimen\z@ by \dimen@ 32	

1996-07-26	ltsect.dtx v1.0u	tests	1166
	\@starttoc: removed \global before \@nobreak...	967	
	\@xsect: Removed \global before \@nobreak...	963	
1996-07-26	ltspace.dtx v1.2p		
	\if@nobreak: put \global inside definition	436	
1996-07-27	ltfssbas.dtx v3.0q		
	General: \if@inmath switch removed	548	
1996-07-27	ltspace.dtx v1.2q		
	General: Further documentation of problems	430	
1996-07-27	ltspace.dtx v1.2r		
	General: Correct documentation of problems	430	
1996-08-02	ltfloat.dtx v1.1o		
	\@xmpar: Remove \global before \@ignore...	986	
1996-08-02	ltsect.dtx v1.0v		
	\@afterheading: Removed \global before \@nobreak...	965	
1996-08-02	ltspace.dtx v1.2s		
	\@EspHack: Remove \global before \@ignore...	439	
1996-08-25	ltfssbas.dtx v3.0r		
	\nfss@catcodes: Reset the acute, grave and double quote chars as well	551	
1996-09-21	ltoutput.dtx v1.1w		
	\@writesetup: Added \@parboxrestore and made consequent deletions: wait for the howls of protest	1188	
1996-09-25	ltdirchk.dtx v1.0t		
	General: Move ltxcheck to separate file	13	
1996-09-28	ltmisen.dtx v1.1f		
	\@obeysp: Moved to ltspace.dtx . .	836	
1996-09-28	ltspace.dtx v1.2t		
	\@obeysp: Moved from ltmisen.dtx and redefined to use \ nobreakspace	446	
1996-09-29	ltfiles.dtx v1.1g		
	\document: Added disabling of \@nодокумент	455	
1996-09-29	ltoutput.dtx v1.1x		
	\newpage: Checks for noskipsec and inlabel added	1166	
1996-09-29	ltsect.dtx 1.0w		
	\@noskipsectrue: Added documentation	959	
1996-09-30	ltoutput.dtx v1.1y		
	\newpage: Checks for noskipsec and inlabel removed pending further		
	tests	1166	
1996-10-04	ltclass.dtx v1.0v		
	\RequirePackageWithOptions: Reset \@unprocessedoptions for /2269	1061	
1996-10-05	ltfiles.dtx v1.1h		
	\@clubpenalty: Added setting its value	453	
1996-10-08	ltfntcmd.dtx v3.3u		
	\DeclareTextFontCommand: Removed \check@icr when in vmode since it causes various errors (see pr/2157)	749	
1996-10-21	lttab.dtx v1.1i		
	\@array: Use \set@typeset@protect	910	
	General: Moved the code associated with \@mkpream into the group provided by the box, for robustness (latex/2183)	909	
	\multicolumn: Make \multicolumn long (latex/2180)	912	
	\tabbing: Moved the \indent so that the \everypar can remove it when necessary; this is needed because the code for items in lists has changed (see pr/22111)	904	
1996-10-23	ltlists.dtx v1.0m		
	\@item: \@nobreak... moved into the \everypar and not executed unconditionally, see above	874	
	\kern... changed to \setbox...	873	
	Added setting of \clubpenalty and set \@nobreakfalse only when necessary	874	
1996-10-23	ltsect.dtx v1.0x		
	\@xsect: Replaced \hskip... with \setbox... as used in \@afterheading	963	
1996-10-24	ltboxes.dtx v1.1a		
	\@arrayparboxrestore: Added local settings of flags: dangerous!	889	
	\@iiminipage: Use it or lose it (@setminpage): Frank will want to lose it	891	
1996-10-24	ltfloat.dtx v1.1p		
	\@floatboxreset: Added local settings of flags: dangerous!	979	
	\@marginparreset: Added local settings of flags: dangerous!	985	
	\@xfloat: Added \@nодокумент to trap floats in the preamble	976	
1996-10-24	ltoutput.dtx v1.1z		
	\@addtocurcol: Added \nobreak, etc as appropriate	1204, 1210	

\@specialoutput: Added \nobreak as appropriate	1174	1996-11-04 ltlists.dtx v1.0q
\@topnewpage: Added \@nодокумент to trap \twocolumn in the preamble	1168	\@trivlist: Moved check for missing item: only checked when not inlabel flag is false
\newpage: Better checks for noskipsec and inlabel added, plus nobreak	1166	1996-11-05 ltfiles.dtx v1.1i
1996-10-25 ltlists.dtx v1.0n		\nofiles: Standard \if@nobreak test added
\endtrivlist: Change \indent to \leavevmode	869	1996-11-09 ltmath.dtx v1.1c
Reset flags explicitly	869	\@ensuredmath: Made long, as it was before. /2104
1996-10-25 ltoutput.dtx v1.2a		1996-11-18 ltfssbas.dtx v3.0s
\newpage: Reset all flags explicitly	1166	\define@newfont: (DPC) lowercase fd file names. internal/1044
1996-10-26 ltlists.dtx v1.0o		1996-11-18 ltoutenc.dtx v1.8d
\endtrivlist: Correct typo	869	General: (DPC) lowercase external file names. internal/1044
1996-10-27 ltoutenc.dtx v1.8c		1996-11-20 fontdef.dtx v2.2p
\@strip@args: Removed macro	483	General: lowercase fd and enc.def file names /1044
General: Added \r A	493	1996-11-20 ltvers.dtx v1.0f
Added		General: Check for old format modified /2319
\textasteriskcentered	489, 500	1996-11-23 ltoutenc.dtx v1.8e
Corrected syntax descriptions	476	General: Corrected description
Removed \aa and \AA	488, 493, 495	Extended description
1996-10-28 ltpplain.dtx v1.1u		1996-11-28 ltvers.dtx v1.0g
General: (CAR) More doc changes	14	General: Check for old format modified /2319

1996-10-29 ltpplain.dtx v1.1v		\IfFileExists: *** removed from various messages for GNU Make. internal/2338
\dotfill: Got arithmetic correct (CAR)	32	1996-12-06 ltfloat.dtx v1.1r
1996-10-29 ltspace.dtx v1.2u		\@caption: Call \@setminpage if needed. latex/2318
\@gnewline: Added macro	436	1996-12-06 ltfssini.dtx v3.0h
\@no@lnbk: Macro replaces \@lnbk and \@nolnbk	434	General: (DPC) Remove *** from messages internal/2338
\\: Corrected and rationalised code	434	1996-12-17 ltdefns.dtx v1.0w
\nolinebreak: Reimplemented both using \@no@lnbk	433	\g@addto@macro: Use \begingroup to save making a mathord
1996-10-31 ltfinal.dtx v1.0z		1996-12-20 ltsect.dtx v1.0z
General: Added extra \lcode, hoping it does no harm in T1 (pr/1969)	1266, 1273	\@dottedtocline: Added \nobreak for latex/2343
1996-10-31 ltlists.dtx v1.0p		1997-01-08 fontdef.dtx v2.2q
\@trivlist: Added check for missing item in outer list	868	General: Use \DeclareMathDelimiter to set delimiter codes
1996-10-31 ltsect.dtx v1.0y		\mathparagraph: Define using \DeclareMathSymbol
General: Corrected and tidied documentation; removed long lines	958	1997-01-08 ltfiles.dtx v1.1j
1996-11-03 ltpplain.dtx v1.1w		\@include: reset \deadcycles
\dotfill: Saved tokens by using \hb@xt@	32	latex/2365
1996-11-04 lterror.dtx v1.2m		462
\@nодокумент: Always define \@nодокумент in kernel, so that it can be cleared by \document.	404	

1997-01-08 ltmath.dtx v1.1d		1997-05-29 ltlogos.dtx v1.1f	
\root: (DPC) Remove spurious space tokens from plain TeX definition /2359	846	\LaTeXe: Added \math so that the L ^A T _E X 2 _E logo works with non-zero values of \mathsurround.	450
1997-02-05 ltdefns.dtx v1.0x		1997-06-16 ltdirchk.dtx v1.0v	
\g@addto@macro: missing percent /2402	112	General: documentation improvements mainly from internal/2520	1
1997-02-21 ltlists.dtx v1.0r		1997-06-16 ltfloat.dtx v1.1s	
\@item: \ifvoid check added for \noindent. latex/2414	873	General: documentation fixes	972
1997-03-21 ltcnts.dtx v1.1e		1997-06-16 ltfntcmd.dtx v3.3v	
\fnsymbol: Use \mathsection and \mathparagraph. latex/2445	528	General: Fix typo in documentation.	747
1997-04-14 ltfiles.dtx v1.1k		1997-08-05 ltoutenc.dtx v1.9e	
\document: Set the document space factor defaults. latex/2404	454	General: Corrected order of arguments in \UseTextSymbol example.	476
\normalsfcodes: Macro added (from patch file) latex/2404	458	1997-08-29 ltoutenc.dtx v1.9f	
1997-04-14 ltoutput.dtx v1.2b		General: Added OT4 encoding, provided by Marcin Woliński.	475
\@writesetup: Call \normalsfcodes (from patch file) latex/2404	1190	1997-09-09 ltnums.dtx v1.2z	
Move \label and \index (from patch file)	1190	\provide@command: Use \begingroup to avoid generating math ords if used in math mode. pr/2573	88
1997-04-24 ltbibl.dtx v1.1m		\@getcirc: Warn if lines become invisible pr/2524	943
\@citex: \empty to avoid primitive error on empty cite keys. latex/2432	1000	\@picture@warn: Macro added pr/2524	943
1997-04-30 ltoutenc.dtx v1.9a		\@sline: Warn if lines become invisible pr/2524	932
General: Changed \textsc to \scshape	490	1997-10-06 ltcnts.dtx v1.1f	
Introduced \textcopyright and modified \copyright	489	\@Roman: Change \@Roman to be fully expandable, so that the result is written properly to files.	528
Introduced \textcopyright and modify \copyright	490	\@slowromancap: Macro added.	528
Modified \textunderscore, removing \mathunderscore	489	1997-10-08 ltlogos.dtx v1.1h	
Modified \underscore, removing \mathunderscore	490	\LaTeX: Simplify macro (force loading of suitable math fonts once).	450
1997-04-30 ltoutenc.dtx v1.9b		1997-10-10 ltclass.dtx v1.0y	
General: Added \leavevmode to \textunderscore	489	\endfilecontents: \@currenvir in banner	1076
1997-05-04 ltoutenc.dtx v1.9c		\reserved@c not \verb@im@out to save a csname	1075
General: Added ‘hex index tabs’	496	Check for text before or after \end environment. latex/2636	1076
Added TS1 encoding v2.2.beta	502	Use \gobbletwo	1075
1997-05-07 ltoutenc.dtx v1.9d		1997-10-17 ltfntcmd.dtx v3.3w	
General: Added \leavevmode to \textcompwordmark	489	\check@nocorr@: Check for vertical mode moved here, from \DeclareTextFontCommand (see PR/2646).	751
1997-05-07 ltspace.dtx v1.2v		\DeclareTextFontCommand:	
\newline: Made completely robust.	435	Reinstalled \check@icr as check is now done in \check@nocorr@ (see PR/2646).	749
1997-05-29 lfsstrc.dtx v3.0j			
General: Replaced \\ by \MessageBreak, as suggested by Donald Arseneau.	635		

1997-10-20	ltfinal.dtx v1.1a		Added section.	518
	\@uclclist: Removed \aa and \AA from \@uclclist as these are macros.	1274	Added textcomp.sty.	475
1997-10-21	ltdefns.dtx v1.2z1		As in OT1, Added \leavevmode at start of \c, otherwise the output routine might be invoked within the macro.	494
	\renew@command: Use \begingroup/\endgroup rather than braces for grouping, to avoid generating empty math atom.	86	Changed to decimal codes in \oalign.	505
1997-10-21	ltfssbas.dtx v3.0t		Changed to decimal codes.	500
	\define@newfont: Move \makeatletter to \nfss@catcodes.	550	Documentation changes and additions.	475
	\nfss@catcodes: Moved \makeatletter from \try@load@font@shape.	551	Example corrected, braces removed.	475
1997-11-09	ltoutput.dtx v1.2c		Removed default settings, see next section.	502
	\@specialoutput: Remove incorrect code: only one \emptycol is needed here	1172	1997-12-19	ltoutenc.dtx v1.9i
	\@topnewpage: Documentation of vsize check enhanced	1167	General: Documentation corrections.	475
1997-11-13	ltfssdcl.dtx v3.0f		1997-12-20	fontdef.dtx v2.2s
	\DeclareSymbolFont: (DPC) Really update \group@list don't leave new version in \toks@. latex/2661	677	General: Added documentation . . .	725
	\stepcounter: (DPC) Remove as never used. (Re)defined in ltcounts	665	1997-12-31	ltoutenc.dtx v1.9k
1997-11-19	ltfloat.dtx v1.1t		General: Further correction	476
	\@footnotetext: Missing percent, again	991	1998-01-12	ltoutenc.dtx v1.9k

2015-01-23 ltplain.dtx v2.0c		General: Removed autoload code . . .	37
\xtrafloats: reserve counts 256–265	20	2015-02-21 ltvers.dtx v1.0w	
2015-01-24 ltfinal.dtx v2.0c		\@check@IncludeInRelease: set \@currname empty here (in case \IncludeInRelease input early) . .	39
General: Skip T1-code entirely with Unicode engines	1264	2015-02-22 ltfsscmp.dtx v3.0e	
2015-02-03 ltfinal.dtx v2.0d		General: Moved all code into latexrelease - obsolete commands are no longer automatically part of the kernel	658
General: Set \lccode for – with Unicode engines	1265	2015-03-02 ltplain.dtx v2.0f	
2015-02-16 ltoutenc.dtx v1.99m		\@mathgroup@top: macro added . . .	19
General: Added \textcommabelow latex/4414	490	\newlanguage: allow 255 math groups in Unicode engines	17
2015-02-16 ltoutenc.dtx v1.99n		2015-03-10 ltplain.dtx v2.0g	
General: Added \textcommabove . .	491	\hideoutput: macro added	36
Added composites for ¢	499	\loggingall: Reorganize to be less noisy	33
Added composites for \c	494	\tracingnone: macro added	34
2015-02-16 lttextcomp.dtx v1.99m		2015-03-12 ltoutput.dtx v1.2m	
General: Added lmmt (Heiko Oberdiek) latex/4415	786	General: initialise \dbldeflist again	1163
2015-02-19 ltvers.dtx v1.0q		2015-03-18 ltfssdcl.dtx v3.0q	
\@check@IncludeInRelease: Swap argument order	39	\DeclareSymbolFont: Restrict Symbol fonts to 0–15	677
2015-02-20 ltplain.dtx v2.0d		\document@select@group: Introduce \@mathgroup@top	668
\loggingall: Spell commands correctly :-)	33	\select@group: Introduce \@mathgroup@top	666
2015-02-21 ltdefns.dtx v1.4b		2015-03-26 ltfinal.dtx v2.0d	
General: Removed autoload support .	80	General: Use renamed unicode-letters.def	1264
2015-02-21 lterror.dtx v1.2o		2015-04-07 ltfssbas.dtx v3.1a	
General: Removed autoload support	397	\wrong@fontshape: Try loading fd file if family has changed	554
2015-02-21 ltfiles.dtx v1.1m		2015-04-28 ltfinal.dtx v2.0f	
General: Removed autoload support	451	\newXeTeXintercharclass: define \@alloc@intercharclass for compatibility with older xelatex initialization	1261
2015-02-21 ltfssbas.dtx v3.0z		2015-05-10 ltlists.dtx v1.0t	
General: Removed autoload code . .	533	\doendpe: Explicitly reset \clubpenalty before clearing \everypar; see also pr/0462 and pr/4065	871
2015-02-21 ltfsscmp.dtx v3.0d		2015-06-19 ltfinal.dtx v2.0g	
General: Removed autoload code . .	658	\@alloc@intercharclass@top: Use –1 for first range to get contiguous allocation	1261
2015-02-21 ltfsdcl.dtx v3.0p			
General: Removed autoload code . .	663		
2015-02-21 lfsstsrc.dtx v3.0k			
General: Removed autoload code . .	633		
2015-02-21 ltoutenc.dtx v1.99m			
General: Removed autoload code . .	475		
2015-02-21 ltoutput.dtx v1.2n			
General: Removed autoload code . .	1152		
\f@depth: macro added(latexrelease)	1175		
2015-02-21 ltpictur.dtx v1.1k			
General: Removed autoload code . .	922		

\newmarks: Use -1 for first range to get contiguous allocation	1260	module_warning: Function added	56
2015-06-19 lplain.dtx v2.0h		modules: Function modified	54
General: delete spurious old definition of \newtoks	23	create_callback: Function added	67
\@alloc: extra braces in case arguments not single token	19	provides_module: Function added	54
\newlanguage: Use -1 for first range to get contiguous allocation	17	luatexbase: Table added	54
2015-06-23 lfinal.dtx v2.0h		2015-10-02 ldirchk.dtx v1.2a	
General: set \patch@level in ltvers rather than in lfinal/ltpatch	1276	General: Allow backing out of unprefixed names	3
2015-06-23 ltvers.dtx v1.0t		2015-10-02 lluatex.dtx v1.0b	
General: set \patch@level in ltvers rather than in lfinal/ltpatch	37	General: Fix backing out of TeX code	53
2015-08-06 lplain.dtx v2.0i		2015-10-02 lluatex.dtx v1.0c	
\xtrafloats: Add \string in case argument is not an unexpandable primitive	20	General: Allow backing out of Lua code	53
2015-08-23 ldirchk.dtx v1.2		2015-10-02 lluatex.dtx v1.0e	
General: Do not use luatex prefix	3	uninstall: Function added	72
2015-08-23 ltvers.dtx v1.0v		2015-10-03 lluatex.dtx v1.0f	
General: Allow negative patchlevel for pre-release	38	provides_module: use luatexbase_log	54
2015-08-30 lplain.dtx v2.1a		2015-10-27 lplain.dtx v2.1b	
\newinsert: new \newinsert implementation	22	\xtrafloats: Use global assignment when switching to extended range	20
2015-09-205 ltoutput.dtx v1.3a		2015-11-07 lspace.dtx v1.3f	
General: extended \@freelist	1162	\@esphack: Only space if there is no space at the end of the hlist latex/4443	438
2015-09-24 lluatex.dtx v1.0a		2015-11-14 lluatex.dtx v1.0g	
call_callback: Function added	67	General: Track LuaTeX changes for (new)token.create	56
callback.register: Function modified	64	2015-11-18 lplain.dtx v2.2a	
callback_descriptions: Function added	71	\newlanguage: Extended stream allocation in luatex (0.85)	17
\catcodetable@atletter: Macro added	49	2015-11-19 lplain.dtx v2.2b	
\catcodetable@initex: Macro added	49	\newlanguage: Only extend allocation of write streams (see luatex list)	17
\catcodetable@latex: Macro added	49	2015-11-27 lluatex.dtx v1.0h	
\catcodetable@string: Macro added	49	callback_descriptions: Match test in in-callback latex/4445	71
add_to_callback: Function added	68	in_callback: Guard against undefined list latex/4445	71
remove_from_callback: Function added	70	2015-11-29 lluatex.dtx v1.0i	
new_attribute: Function added	57	General: Declare this as local before used in the module error definitions (PHG)	54
disable_callback: Function added	71	call_callback: Check name is not nil in error message (PHG)	67
in_callback: Function added	71	create_callback: Check name is not nil in error message (PHG)	67
\newattribute: Macro added	49	2015-12-02 lluatex.dtx v1.0j	
\newcatcodetable: Macro added	49	General: Adjust hastokens to store the result of tex.hastokens(), not the function (PHG)	56
\newluabytecode: Macro added	52	Assorted typos fixed (PHG)	46
\newluachunkname: Macro added	52	Declaration/use of first_head fixed (PHG)	55
\newluafunction: Macro added	51		
\newwhatsit: Macro added	51		
module_error: Function added	56		
module_info: Function added	56		

Remove nonlocal iteration variables (PHG)	46	\DeclareMathAccent: Check for mathaccent not \mathaccemt	683
Remove unreachable code after calls to error() (PHG)	46	\DeclareMathRadical: Check for radical not \radical	691
2015-12-02 lltuatem.dtx v1.0k		\DeclareMathSymbol: Check for mathchar not \mathchar	686
General: resolve name and i.description (PHG)	65	2016-03-13 lltuatem.dtx v1.0n	
call_callback: Give more specific error messages (PHG)	67	General: contribute_ filter added	63
add_to_callback: Give more specific error messages (PHG)	68	insert_ local_ par added	63
remove_from_callback: adjust initialization of cb local (PHG) . .	70	2016-03-29 ltpictur.dtx v1.1l	
Give more specific error messages (PHG)	70	\oval: add setting of line tests	944, 945
create_callback: Give more specific error messages (PHG)	67	initialise tests	944
2015-12-10 ltfinal.dtx v2.0i		\ovhorz: use glue not leaders if horizontal line not required	947
General: Use new common Unicode data loaders	1264	\ovvert: use glue not leaders if vertical line not required	946
2015-12-18 lltuatem.dtx v1.0l		\if@ovhline: macro added (latex/4452)	944
General: Load Unicode data from source	49	\if@ovvline: macro added (latex/4452)	944
2016-01-04 ltfinal.dtx v2.0j		2016-04-22 ltfinal.dtx v2.0q	
General: Do not set up inter character classes for XeTeX	1264	\@alloc@intercharclass@top: XeTeX 0.99996 has 4096 char classes not 256	1261
\@alloc@intercharclass@top: Start allocation at one not three	1261	2016-06-19 ltoutenc.dtx v1.99m	
2016-01-05 ltfinal.dtx v2.0k		General: OT1 definition (was duplicate T1 definition)	494
\@alloc@intercharclass@top: Remove duplicated code	1261	2016-06-20 ltclass.dtx v1.1j	
2016-01-05 ltfinal.dtx v2.0l		General: don't declare as \onlypreamble	1048
General: Correct \textrerelease guards	1264	2016-07-29 lplain.dtx v2.2c	
Ensure old definitions for inter-character class toks are		\extrafloats: use \global \chardef	20
available using \textrerelease	1264	\newinsert: fix for tlb-newinsert-001	22
Missing brace	1264	2016-10-02 ltclass.dtx v1.2a	
2016-01-05 ltfinal.dtx v2.0m		\ifclasswith: Ignore spaces while checking for option clash	1049
General: Undefine XeTeX classes when using patching an older kernel	1264	\ExecuteOptions: Ignore spaces in argument	1059
2016-01-05 ltfinal.dtx v2.0p		2016-10-15 ltdirchk.dtx v1.2b	
General: Only apply XeTeX change if XeTeX is in use	1264	General: Require eTEX	3
2016-02-11 lltuatem.dtx v1.0m		2016-10-15 lterror.dtx v1.2p	
General: pdf_stream_filter_callback removed	64	General: Require eTEX	397
process_rule, [hv]pack_quality append_to_vlist_filter added	63	2016-10-15 ltfinal.dtx v2.0r	
read_cidmap_file added	62	General: Require eTEX	1260
show_warning_message added	63	2016-10-15 ltfinal.dtx v2.0s	
token_filter removed	63	General: Tidy up status of char 127	1260
2016-02-18 ltfsdcl.dtx v3.0r		2016-10-15 ltfssini.dtx v3.1b	
\@DeclareMathDelimiter: Check for delimiter not \delimiter	688	General: Require eTEX	695
		2016-10-15 lplain.dtx v2.2d	
		General: Require eTEX	14
		2016-10-16 lplain.dtx v2.3a	
		\newlanguage: Allow languages up to 16383 in luatex	17

2016-10-19	ltcounts.dtx v1.1j		declare composites with empty base for hat and tilde, use same slots for \textasciicircum ans
	\TextOrMath: Test directly for \protected 529		\textasciicircum ans
2016-11-06	ltplain.dtx v2.3b		\textasciitilde 507
	General: Drop \outer entirely 14		declare straight quotes using new \remove@tlig command 507
2016-11-09	ltclass.dtx v2.1b		2017-02-22 ltoutenc.dtx v2.0g
	\@fileswithoptions: Improve \ifx tests PR/4497 1063		General: Fix typo introduced at 2.0f 507
2016-11-17	ltluatex.dtx v1.0p		2017-02-24 ltoutenc.dtx v2.0h
	General: call_ edit added 63		General: introduce
2016-12-03	fontdef.dtx v3.0a		\DeclareUnicodeAccent 507
	General: (DPC) Default to TU encoding for Unicode TeX engines 725		\DeclareTextCompositeCommand: add
	\shapedefault: (DPC) Default to TU encoding for Unicode TeX engines 729		check whether the accent command is defined for this encoding 483
2016-12-04	ltoutenc.dtx v2.0a		2017-03-08 ltclass.dtx v1.2c
	General: Added TU encoding 507		General: add \@parse@version@dash to support yyyy-mm-dd as well as yyyy/mm/dd 1048
2017-01-01	ltoutput.dtx v1.3b		2017-03-09 ltfinal.dtx v2.0t
	General: make fpmin negative so ignored even if float height is negative 1236		\l@nohyphenation: ensure \l@nohyphenation is defined. 1267
2017-01-10	ltfssbas.dtx v3.2a		2017-03-09 ltmiscen.dtx v1.1m
	\showhyphens: Add version of \showhyphens that works with XeTeX. 560		\verb@: Use \language not \hyphenchar 837
2017-01-23	ltoutenc.dtx v2.0b		\verb: Use \language to stop hyphenation 842
	General: Added TU specific commands in ASCII range pr/4500 507		2017-03-10 ltfiles.dtx v1.1n
2017-01-24	ltoutenc.dtx v2.0c		\document: Save language default ... 454
	General: Declare TU composites for i and j 507		2017-03-10 ltoutput.dtx v1.3c
	Make \textasteriskcentered U+2217 not U+204E 507		\@writesetup: Reset \language ... 1189
	TeX ligature syntax for xetex and luatex reversed 507		2017-03-13 ltdefns.dtx v1.5a
2017-01-24	ltoutenc.dtx v2.0d		\-: Define \- in terms of \hyphenchar 110
	General: Declare macron composites for YyGg 507		2017-03-27 ltdefns.dtx v1.5b
2017-02-12	ltoutenc.dtx v2.0e		\@dischyp: Define \@dischyp after \- 110
	General: Declare fallback code for \textasteriskcentered 507		2017-03-28 ltluatex.dtx v1.1e
